a *Transcript of the Record on Appeal to the Supreme Court of the United States.*

In the United States District Court, District of Nebraska, Lincoln Division.

No. 10, Docket A.

In the Matter of THE LINCOLN GAS AND ELECTRIC LIGHT COMPANY

versus

THE CITY OF LINCOLN; ELLIOTT LOWE and FRED L. KNIGHT, Interveners.

Pleas Before the Honorable Page Morris, Judge of the District Court of the United States for the District of Minnesota, Assigned at the May, 1916, Term of the United States District Court for the District of Nebraska, Lincoln Division.

Appearances:

E. C. Strode, Lincoln, Nebraska; Halleck F. Rose, Omaha, Nebraska, for Plaintiff.

C. Petrus Peterson, Lincoln, Nebraska; Wm. M. Morning, Lincoln, Nebraska, for Defendant.

John M. Stewart, Lincoln, Nebraska, for Interveners.

1 *Bill of Complaint.*

Filed in United States Circuit Court of the United States, for the District of Nebraska, Lincoln Division, December 27, 1906.

To the Honorable the Judges of the Circuit Court of the United States in and for the District of Nebraska:

The Lincoln Gas & Electric Light Company, a corporation organized under the laws of the State of Nebraska and a citizen of said state, brings this, its bill of complaint, against the City of Lincoln, Francis W. Brown, Mayor, and Edmund C. Strode, city attorney of said city, all of whom are citizens of the State of Nebraska.

And thereupon your orator complains and says the amount in controversy herein, exclusive of interest and costs, exceeds the sum and value of $2,000, and this case arises under the constitution and laws of the United States.

Your orator, the Lincoln Gas & Electric Light Company, is a corporation organized on or about the first day of December, 1901, under the laws of the State of Nebraska, having its principal place of business at the City of Lincoln in Lancaster County; and by its articles of incorporation it has, among others, the following powers:

The general nature of the business to be transacted by this corporation shall be to acquire, by purchase, grant or otherwise, and to own, hold maintain and operate suitable grounds, buildings, machinery, apparatus, appliances, pipes, mains services, wires, poles, and other structures for the manufacture and distribution of gas and electricity for the purposes of light, heat and power, and steam for the
2 purpose of heat and power; to erect, maintain and operate proper and suitable buildings, works, machinery, apparatus and appliances for the manufacture, purification and distribution of gas and electricity for light, heat and power and steam for the purpose of heat and power; to purchase, acquire, own, hold, lay, erect and maintain within the corporate limits of the City of Lincoln, Lancaster County, Nebraska, and in the territory adjacent thereto, in, upon, over and under the streets, highways, lanes, alleys, public grounds and sidewalks thereof or any future additions which may be made thereto, mains, pipes, services, wires, posts, poles, towers, and other structures and appliances necessary or desirable for the distribution of gas or electricity for light, heat or power, and of steam for the purpose of heat and power, and to purchase, hold, operate and acquire franchises from the City of Lincoln for any or all of the purposes aforesaid. This corporation shall have power to borrow money and issue its bonds, debentures and other evidences of debt therefor and to pledge the whole or any part of its properties, rights and franchises for payment thereof, and may sell, assign or convey all or any part of its properties, rights or franchises. And your orator has power to do all things so enumerated in its articles of incorporation and all things incident to the business and powers so enumerated and defined.

After your orator's organization and on or about the 19th day of December, 1901, and after it had fully complied with all the laws of Nebraska requisite to such organization to entitle it to enjoy all the privileges and immunities of a corporation, it acquired by purchase all of the rights, privileges immunities, franchises, properties, real and personal, good will in business and rights in action of the Lincoln Gas & Electric Company, also a corporation, theretofore duly organized under the laws of Nebraska, which rights and prop-
3 erties were, for a full and adequate consideration paid, duly conveyed by said last named corporation by a deed in writing, duly executed.

The said last named corporation, The Lincoln Gas & Electric Company, at the time of so conveying its said rights and properties to your orator, had power to own, hold, maintain, and operate and did so own, hold, maintain and operate suitable grounds, buildings, machinery, apparatus, appliances, pipes, mains, services, wires, poles and other structures for the manufacture and distribution of gas and electricity for light, heat and power in the said city of Lincoln, Nebraska, and the territory adjacent thereto, under privileges and franchises theretofore granted by the defendant the City of Lincoln, and had power and authority to sell, assign and convey all of its said properties, rights and franchises.

Your orator further shows unto your Honors that the privileges

d franchises so enjoyed by the said last named corporation, The ncoln Gas & Electric Company, and acquired by your orator by purchase and conveyance aforesaid, were originally granted by defendant city of Lincoln on or about the 12th day of March, 72, unto the Lincoln Gas Company, a corporation duly organized der the laws of Nebraska, by an ordinance that day duly passed the city council of said defendant, and approved by its mayor, d published in accordance with the law, which was and is in the rds and figures following:

"An ordinance granting the use of the streets, lanes, alleys, public unds and sidewalks, in the City of Lincoln, to the Lincoln Gas mpany.

"Be it ordained by the mayor and councilmen of the City of Lin-n:

"Section 1. That license and permission be and the same are hereby given and granted to the Lincoln Gas Company of Lincoln, Nebraska, to erect, construct, and complete gas works within the corporate limits of the city of Lincoln, aforesaid; and at said company is hereby authorized and permitted to use and cupy the streets, lanes, alleys, public grounds and sidewalks of d city, for the purpose of laying down and repairing all pipes and ier fixtures for conducting gas for light in and under the streets, es, alleys, public grounds and sidewalks of said city, or any future dition which may be made thereto.

"Section 2. The said Lincoln Gas Company shall have the exclusive ght and privilege of furnishing illuminating gas in said city for a riod of twenty-one years from the 9th day of March 1872, and of ng and occupying the streets, lanes, alleys, public grounds and side-lks for the purposes specified in the first section of this ordinance.

"Section 3. The said Lincoln Gas Company shall manufacture d constantly supply (unavoidable delays and accidents excepted) e city and inhabitants of Lincoln, on streets where gas main-es are laid, with good quality of illuminating gas, at a price not to ceed five dollars per one thousand feet.

"Section 4. This ordinance is to take effect and be in force from d after its publication according to law."

It was the purpose and intent of the said defendant, the city of ncoln, by the passage of said ordinance, to grant unto the said The ncoln Gas Company, the perpetual enjoyment and use of all the anchises, rights and privileges to use and occupy the streets, lanes, eys, public grounds, and sidewalks of said city for the purpose of ying down and repairing all pipes and other fixtures for conducting s for light in and under the streets, lanes, alleys, public grounds d sidewalks of said city or any future additions which may be ade thereto, and in addition thereto, and as an inducement to said rporation to accept the said privileges, to grant unto it in the exclusive right and monopoly of said business within the said city for a term of twenty-one years from the 9th day of March 1872.

And your orator further shows unto Your honors that afterwards, an ordinance duly passed by the city council of the defendant the

city of Lincoln, June 16, 1890, and approved by the mayor and published as required by law, section 1 of the ordinance aforesaid was by defendant city amended so as to greatly enlarge and extend the privileges originally granted, and in its amended form was reenacted so as to vest all of the original franchises, rights and privileges, as so extended and enlarged, in the said corporation perpetually and without limitation, and by such amendment, section 1 of said original ordinance was made to read as follows:

"Section 1. That license and permission be and the same are hereby given and granted to the Lincoln Gas Company of Lincoln, Nebraska, to erect, construct, and complete gas works within the corporate limits of the City of Lincoln aforesaid; and the said company is hereby authorized and permitted to use and occupy the streets, lanes, alleys, public grounds and sidewalks of the said city, for the purpose of laying down and repairing all pipes and other fixtures for conducting gas for light, fuel and heat, in and under the streets, lanes, alleys, public grounds, and sidewalks of said city, or any future addition which may be made thereto, and to establish, construct, acquire, maintain, own and operate within the corporate limits aforesaid of said city of Lincoln, the necessary buildings, works, machinery, appliances, and structures, for the purpose of furnishing and supplying electricity for the purpose of illuminating and power for moving machinery and vehicles and erect, acquire, own and maintain within the corporate limits aforesaid, and in and upon the streets, lanes, alleys, public grounds, and sidewalk space of said city, or any future addition which may be made thereto, wires
6 or other conductors of electricity for conducting electricity for illuminating or power purposes, and to erect, acquire, own, establish, and maintain within the corporate limits aforesaid, and in and upon the streets, lanes, alleys, public grounds, and sidewalk space of said city or any future addition thereto, posts, poles, towers, and other structures and appliances for the support of such wires or other conductors of electricity. Provided, That such posts, poles, towers and other structures and appliances, including wires and conductors of electricity, shall be so erected and placed as not to obstruct the use of said streets, lanes, alleys, public grounds, and sidewalk space for the purpose of travel."

Your orator further shows unto Your Honors that the defendant, the City of Lincoln, subsequently and on or about the 30th day of April, 1900, after the term of the monopoly of said Lincoln Gas Company had expired, by an ordinance then duly passed by its council and on May 2, 1900 approved by its mayor and published in accordance with law, again amended section 1 of said original franchise ordinance so as to extend and enlarge the privileges, rights and franchises granted thereunder by making the same negotiable, vendable and assignable, and as so enlarged again reenacted the said grant of franchises, rights and privileges unto said Lincoln Gas Company perpetually and without limitation as to time, and said section 1, as so last amended, was made to read as follows:

"Section 1. That license and permission be and the same are hereby given and granted to the Lincoln Gas Company, of Lincoln,

Nebraska, its successors and assigns, to erect, construct, and complete gas works within the corporate limits of the city of Lincoln aforesaid; and the said company is hereby authorized and permitted
7 to use and occupy the streets, lanes, alleys, public grounds and sidewalks of the said city, for the purpose of laying down and repairing all pipes and other fixtures for conducting gas for light, fuel and heat, in and under the streets, lanes, alleys, public grounds, and sidewalks of the said city, or any future addition which may be made thereto and to establish, construct, acquire, maintain, own, and operate within the corporate limits aforesaid of said city of Lincoln, the necessary buildings, works, machinery, appliances, and structures for the purpose of illumination and power for moving machinery and vehicles, and erect, acquire, own and maintain within the corporate limits aforesaid, and in and upon the streets, lanes, alleys, public grounds, and sidewalks space of said city, or any future addition which may be made thereto, wires, or other conductors of electricity, for conducting electricity for illuminating or power purposes, and to erect, acquire, own, establish and maintain within the corporate limits aforesaid, and in and upon the streets, lanes, alleys, public grounds, and sidewalk space of the said city, or any future addition thereto, posts, poles, towers, and other structures and appliances for the support of such wires or other conductors of electricity: Provided, That such posts, poles, towers, and other structures and appliances, including wires and conductors of electricity, shall be so erected and placed as not to obstruct the use of said streets, lanes, public grounds, and sidewalk space for the purpose of travel."

Your orator further shows unto Your Honors that after the passage of the last aforesaid ordinance, and on or about July 1, 1900, the said Lincoln Gas Company, for full value to it paid, sold, assigned, transferred and set over unto the Lincoln Gas & Electric Company all its franchises, rights and privileges so as aforesaid granted to it by the proceedings and ordinances aforesaid, together with all its properties and all its goodwill in trade and business, all its rights in action, and all its rights, privileges, immunities and franchises what-
8 soever, and duly conveyed the same by deed in writing, duly executed, to the said Lincoln Gas & Electric Company, from whom, as aforesaid, your orator has since acquired them by purchase; so that your orator is now possessed of all of the franchises, rights, privileges and immunities so as aforesaid granted unto the said corporation, the Lincoln Gas Company, and good and lawful title to all thereof perpetually and without limitation as to time is now well vested in your orator as successor by and through the aforesaid mesne conveyances.

Said original ordinance, as so extended and enlarged by the aforesaid amendments, with all the rights, privileges, and franchises thereby conferred by the defendant city, is and since passage thereof has been operative and in full force and effect in law, and your orator, on its part, and its predecessors, from whom your orator derived title thereto, on their part, have fully performed all of the duties and obligations thereby imposed upon it and them, and thereby the said city of Lincoln has agreed to and with your orator that for performance of the duties thereby imposed it shall have full right to enjoy all

of said privileges, and to receive and collect for the services so required to be rendered by your orator reasonable prices and rates of compensation within the limitation prescribed by said grant of $5.00 per thousand feet for gas, and particularly that your orator shall be entitled to collect and receive such reasonable prices and rates as will yield it a fair compensation for the service rendered, taking into consideration the cost and value of its properties employed therein, and the customary, ordinary and necessary wear and tear and depreciation of its appliances, machinery, plant, and equipment from its use in said business, and the capital employed therein, and the reasonable and necessary cost of operation and maintenance.

9 Your orator further shows unto Your honors that the duties by the aforesaid ordinance imposed upon it and the acceptance, use and enjoyment by your orator of the rights, privileges, and franchises thereby granted, required of your orator's predecessors and of your orator the permanent use, investment and employment of large sums of money for purchase of lands and the erection, construction and equipment of a manufacturing and distributing plant for supplying the said city and its inhabitants with gas for fuel and light, heat and power, and for increasing its capacity and extending its facilities for distribution from time to time to meet the demands of the public in a developing and growing city. The properties owned by your orator and necessarily employed in equipment for manufacture, storage and distribution of gas and for performance of its duties imposed by the terms of such grants of rights, privileges and franchises, consist, among others, of a block of ground, described as Block Seventy-nine (79) in the City of Lincoln, and other real estate contiguous thereto, on which was erected at great cost permanent buildings equipped as a manufactory, and gas tanks or holders for storage of gas, many miles of gas mains and service lines extending from mains to the curb lines laid under the streets, many of which are improved by permanent pavements, and stop boxes, and meters, horses, wagons, workshops, tools and appliances and supplies and offices and office furniture and the like. To operate said plant and to maintain and keep the same in repair, requires employment of a large force of workmen and clerks, many of whom are required to be skilled, and to all of whom it is necessary that your orator pay exceedingly high wages. The depreciation by wear and tear and other unavoidable causes in machinery, equipments, appliances and properties amounts usu-

10 ally ordinarily and necessarily, for the uses to which they are put, to ten per cent each year of the entire value of your orator's properties employed in said enterprise, which is eventually to be accounted for and restored in order to maintain the efficiency of your orator's equipment. It is necessary in laying mains to make a joint on an average of every twelve feet, and in the many miles of mains necessary for the distribution of gas, the great number of joints is an unavoidable loss of gas equalling in the aggregate twelve per cent of the gross amount manufactured. The consumption of gas in said city is necessarily small in comparison to the number of miles of mains, due in part to the great width of the

public streets and in part to the fact that no considerable district or portion of the City of Lincoln is compactly built and the services actually in use are scattered over a large territory. The defendant, the City of Lincoln, has for a long time past, by ordinance, required your orator to lay mains through all the streets that are paved or to be paved within any paving districts created or that may hereafter be created in said city, and to carry gas services from such mains to and inside the curb line on each lot frontage on said streets without regard to consumption or probable consumption of gas on such lines, and such mains and services have, at great cost and expense, been laid by your orator in all paved streets, under compulsion of said ordinance.

Your orator further shows unto your Honors that it and its predecessors in ownership of the said rights, privileges and franchises have, pursuant to the invitation of the defendant city contained in the ordinance aforesaid and in faith of the rights, privileges
11 and franchises so granted, and in order to discharge the public duties thereby imposed upon it and them, have expended necessarily in building and equipping said plant more than $1,000,000, and that your orator has valid outstanding obligations secured by conveyance by trust deed, of all its properties, rights and franchises, executed by your orator and your orator's predecessor, the Lincoln Gas Company, and sold for value to and now held by good faith purchasers in form of negotiable bonds, aggregating $1,200,000, of which a prior issue, executed by the said Lincoln Gas Company amounting to $333,000, by their terms bear semi-annual interest at the rate of six per cent, and the residue thereof bear interest payable semi-annually at the rate of five per cent per annum, and that the proceeds of all of said bonds and large amounts of additional capital were and are actually applied and employed in the acquisition and equipment of your orator's plants and properties necessary to carry on its said business, and largely and principally in its plant and equipment for the manufacture and distribution of gas.

Your orator further shows unto your Honors that the defendant, the city of Lincoln, disregarding the contract rights, privileges and immunities of your orator under the aforesaid franchises, to receive, collect and enjoy such reasonable rates and charges as will justly compensate your orator for services rendered, and yield a fair profit and return upon the capital necessarily employed in said enterprise, and in violation of the rights of contract and the rights of property guaranteed to your orator by the constitution of the United States, and under the pretence that it has arbitrary power to determine the price of gas, without regard to the adequacy of the price determined upon to compensate your orator for the service rendered,
12 or to yield a fair revenue upon its capital, by its pretended ordinance No. 432, passed by its city council November 12, 1906, and approved by its mayor, the defendant Francis W. Brown, November 19, 1906, and thereafter published ordained as follows:

"Ordinance No. 432.

An ordinance regulating the price of manufactured gas, establishing penalties for the violation of the provisions of this ordinance and repealing all ordinances in conflict herewith.

Be it ordained by the Mayor and Council of the City of Lincoln:

Section 1. No gas company shall charge exact, demand or collect from any consumer for gas manufactured or sold in the city of Lincoln for illuminating or heating purposes more than the sum of one dollar net per one thousand cubic feet, provided that any gas company may add a penalty of not more than ten cents per one thousand cubic feet for non-payment after six days from the date said gas company has furnished a bill or statement to any consumer; and provided further that a minimum monthly charge of twenty-five cents a month for a single service may be collected.

Section 2. The provisions of this ordinance shall apply to all companies which manufacture or distribute gas for sale for illuminating or heating purposes, and the term "gas company" shall include all persons, firms, corporations or individuals who manufacture or sell gas for illuminating or heating purposes.

Section 3. Any gas company, and any executive officer, president or manager of any gas company who shall violate any provision of this ordinance shall be deemed guilty of a misdemeanor and on conviction thereof shall be fined in any sum not less than
13 ten dollars, nor more than One Hundred Dollars, and a violation hereof for each calendar day or part thereof shall constitute a separate offense.

Section 4. All ordinances or parts of ordinances in conflict with the provisions of this ordinance are hereby repealed.

Section 5. This ordinance shall take effect and be in force from and after December 1, 1906, after its passage, approval and publication, according to law."

Your orator further shows unto your Honors that the maximum rate of $1.00 per thousand cubic feet of gas prescribed and limited by said ordinance, under the conditions subsisting in the said city of Lincoln and the other public burdens imposed upon your orator, necessarily entering into the cost of manufacture and distribution of gas, is wholly arbitrary. No right is in or by said ordinance given or saved to your orator to procure a judicial ascertainment and inquiry of the reasonableness of said rate, and your orator has never had its day in court on said question as to the reasonableness of said rate. By the said ordinance, your orator is deprived of its day in court and of all opportunity of a judicial inquiry and ascertainment of the reasonableness of said rate, contrary to the law of the land and in violation of your orator's vested rights under the aforesaid franchises and privileges, acceptance and use whereof necessitated investment and permanent appropriation to said enterprise of the large sums of money aforesaid.

Your orator further shows unto your Honors that the councilmen of the said City of Lincoln, who comprise its legislative body, did not,

prior to or upon passage of said ordinance, make any accounting or inquiry into the business and methods of your orator to ascertain whether the maximum rate so prescribed and limited was adequate or reasonable, although invited by your orator so to do, and
14 in fixing and determining said rate, the said councilmen did not, as required by their several oaths of office, and by law, act impartially nor endeavor to fix a rate just and reasonable alike for your orator and the public; on the contrary thereof, the said councilmen, moved by unrighteous and unlawful considerations and motives, took the said action and passed the said ordinance out of a desire to serve only their electors and constituents who placed them in office, solely at the cost and to the utter financial ruin of your orator, and wholly from partisan and partial motives. Prior to and at the time of the passage of the aforesaid ordinance pretending to prescribe said maximum rate of $1.00 per thousand cubic feet of gas, the publishers of the State Journal and The Evening News both daily newspapers published at said city of Lincoln of wide circulation and great influence among the electors of said city, had published persistently and continuously certain malicious, false and defamatory charges against your orator for the purpose of influencing and intimidating the action of the defendant's city council in establishing a maximum gas rate, in and by which the said newspapers falsely published and asserted to the members of the defendant's city council and the electors of said city that the rates charged by your orator were excessive and exorbitant, and that the people of the city demanded of its city council that it arbitrarily and at once pass an ordinance limiting the price of gas to the sum of $1.00 per thousand cubic feet; and theretofore the said newspapers, by the means aforesaid, and by virtue of their wide circulation and great influence with the electors and with the council of said city, for the purpose of coercing such action on the part of the defendant, caused to be organized a pretended one dollar gas league, and thus fomented discontent and hostility to your orator and invited all electors of the city to send their names to an agency of the said newspapers to be enrolled
15 as members of the Dollar Gas League, and caused inflammatory suggestions, thus invited, fomented and incited by its own publications only, to be published daily, and by such means threatened and caused the councilmen to fear public condemnation and political defeat unless they yielded to the unrighteous demands of said newspapers and the sentiments so fomented among the electors, moved by the aforesaid sensational utterances so published. By such means, the said councilmen were, in fact, intimidated, and coerced into the passage of said ordinance, and deprived of their free agency and of their ability to act debilerately and impartially upon the said issue, and certain of the councilmen, particularly one John S. Bishop, were led to give utterance to the sensational sentiments of said newspapers in the deliberations of the council respecting the passage of said ordinance, and the said Bishop, during the deliberations of the council upon said issue, stated publicly, on the floor of the council and to his fellow councilmen, that it would be a good thing for the community if the action of the council resulted in the finan-

cial ruin of your orator and the placing of its affairs in the hands of a receiver. By all such means, the majority of the said council, whose honest judgments condemned the rate established by the ordinance were induced to forego their several convictions and judgments and, notwithstanding, to pass the ordinance. Your orator charges that the proceedings so taken under coercion are fraudulent and null and void and of no effect in law.

Your orator further shows unto Your Honors that, in addition to the facts hereinbefore stated in this bill of complaint, the following facts and circumstances add materially to the necessary cost of manufacture and distribution of gas in the City of Lincoln; (1) Under existing tax levies and ordinances of the City of Lincoln, the annual impositions of taxes upon your orator's properties and busi-
16 ness, for municipal, school, district state and county purposes, aggregates the sum of about $20,000 of which $10,000 is an occupation tax imposed by the City of Lincoln by ordinance, the validity of which your orator questions and the legality of which has not yet been determined. (2) The defendant, the City of Lincoln, by its ordinance No. 363, passed by its city council April 9, 1906, and approved by the mayor April 16, 1906, has adopted and imposed upon your orator certain rules fixing unusually high and onerous standards for measurements, for quality as to purity, and for illuminating and heating power of gas, by which your orator is required under the penalties of heavy fines and forfeitures to continuously maintain each of the three standards prescribed, one of which is an illuminating power of not less than 18 English Sperm Candles when burned from a Suggs London Argand Burner No. 1 at the rate of 5 cubic feet per hour; one requiring a heat standard of not less than 625 British Thermal Units per cubic feet, at a pressure of 14.7 pounds per square inch, at a temperature of 60 degrees Fahrenheit scale; and one fixing the requisites as to purity, requiring sufficient odor to be detected by the sense of smell that it contains not to exceed 20 grains of sulphur per 100 cubic feet, and not exceed 10 grains of ammonia per 100 cubic feet, and that it shall contain no sulphurated hydrogen, and that it shall have a pressure of not less than 1½ inches nor more than 5 inches measured in a water gauge at the place where tested. The said ordinance subjects your orator's business in m-ny particulars to the direction and control of the public gas inspector, prescribes a standard of accuracy for meters, and subjects your orator to the cost of disconnecting and delivering all or any of its gas meters to the city inspector within twenty-four hours after notice by said officer, and in addition to burdensome and oppressive fines imposed for vio-
17 lation of each and every of such regulations, the said ordinance subjects your orator to a reduction of five cents from the price allowed to be charged to consumers for each 1,000 feet of gas, under ordinance of said city, for every time the standard of heat falls ten units below that prescribed. (3) It is not practical to maintain all of said standards otherwise than by use of both coal and oil in the manufacture of gas, and for a number of years last past the market value thereof, particularly that of coal, has largely and greatly increased in price, and the said city is far removed from any

source of supply thereof, and freights for its carriage for long distances must be added to the usual and ordinary cost thereof. (4) For a number of years last past the prices of all materials used by your orator in construction and equipment of its plant and appliances have steadily advanced in market values, as has also the cost of labor, both skilled and unskilled. Your orator shows that all of the facts aforesaid tended constantly and necessarily to increase, during the period of some years last past, the cost of manufacture and distribution of gas, and that during all of the period aforesaid, it has been the policy of the city, notwithstanding, to pursue a course of persistently and steadily diminishing the maximum rates of gas in said city and of increasing the public burdens and tax impositions to be borne by your orator, and by such means to decrease your orator's revenues ratably upon the business done and impair its pecuniary credit and ability to pay interest charges upon its bona fide debts and maintain the efficiency of its properties and service, and greatly to depreciate the market value of all its mortgage bonds and properties so that at the date of the passage of the said ordinance fixing a maximum rate of $1.00 per 1,000 cubic feet of gas, the market value of your
18 orator's securities was depreciated to a sum not exceeding much, if any, one-half of its invested capital.

Your orator further shows unto Your Honors that the rate of $1.00 per 1,000 cubic feet of gas prescribed and limited by said ordinance is wholly inadequate to yield your orator a reasonable compensation for the service by the terms of its franchise required to be rendered, and will not yield sufficient revenue to pay the cost of manufacture, distribution, operation and maintenance of its manufacturing plant and properties necessarily employed therein, and yield reasonable or adequate or fair earnings on the large amount of capital so as aforesaid permanently employed and invested in said enterprise, and which the defendant city, by granting of said franchises and inviting and inducing said investment, agreed your orator should employ at fair and adequate profits and earnings. Said rate of $1.00 per 1,000 cubic feet of gas will, if enforced against your orator, together with the additional burden of the occupation tax heretofore mentioned, the validity of which your orator contests, without lessening the necessary cost of manufacture, distribution, operation and maintenance, decrease your orator's earnings in the sum of $40,000 per annum and upwards below the revenues accruing from the gross rate of $1.50 heretofore fixed by the ordinance of said city and charged by your orator, with an allowance of 30¢ per 1,000 cubic feet on monthly payments made at your orator's office on or before the 6th day of each month, and will decrease your orator's revenues $40,000 and upwards below that which is necessary to maintain the service and yield a fair or adequate or reasonable compensation upon its invested capital. The said rate, if enforced against your orator, will deprive it of the power to pay interest upon the money which it has borrowed and actually used and in-
19 vested in its aforesaid properties, and will deprive your orator and the owners and holders of its negotiable mortgage bonds and the owners and holders of its shares of capital stock of adequate

earnings, interest and dividends on their large sums of money invested therein and employed in said enterprise; and will operate as a condemnation and confiscation of the properties of your orator, its bond holders and share holders to public uses without any compensation paid therefor; and will deprive your orator and its mortgage bond holders and share holders of their property without due process of law; and will impair the obligation of the contract of said city of Lincoln made with your orator and its predecessors in ownership of said franchises under and by virtue of the aforesaid grants of rights, privileges and franchises and the duties thereby imposed upon your orator and its said predecessors and by it and them assumed thereunder.

Your orator further shows unto Your Honors that the pretended regulations contained in said ordinance so pretending to fix said maximum rate of $1.00 are likewise violative of your orator's rights guaranteed by the Constitution of the United States in this: The system of charges so adopted is a level or flat meter rate, applicable alike to profitable and to unprofitable consumers and is a system not in general or common use, wholly unjust and arbitrary, and prohibiting your orator from procuring much profitable patronage from large consumers.

(1) Your orator has upwards of 5,000 gas consumers and certain elements of the necessary cost of service are incurred ratably on account of each consumer, among which are the office expenses, the accounting and auditing department, the expense of meter reading and making out bills, the expense of connecting meters and disconnecting them, the expense of mains to which each individual service pipe is joined, the expense of the plant and equipment to meet the possible demand of each consumer, and interest on bonded debt, and, in fact, approximately all the expenses of operation and distribution, aside from the station cost of manufacture. Because thereof, your orator incurs an actual loss on account of the service furnished each individual consumer from whom it is not permitted to collect an average monthly charge equalling $2.00. Your orator has upwards of 2,700 consumers of gas, whose bills at the rate of $1.20 per thousand feet, yield a smaller average revenue than $2.00 per month, and the number of such consumers will be increased if the rate of $1.00 be enforced, to all of whom it gives service and, under the said ordinance will be obliged to give service at a rate actually less than cost thereof. Such consumers, who by force of the said rate ordinance and the said system of charges, the company is obliged to serve at an actual loss, consume one-fifth of all the gas sold by it and distributed to its consumers. The large losses incurred in maintaining the service to said small and unprofitable consumers, your orator, by reason of the said system and plan of charging adopted by said ordinance, is obliged to collect from the large and profitable consumers, and is obliged to apply sufficient of the profits so derived from the large consumers to defray the service and administration charges actually incurred in serving the small consumers at a rate below cost. In respect to the large proportion of its total service which it is required to render at less than

cost, the said ordinance is partial and discriminatory, operates to deprive your orator of its property without due process of law, and requires the profitable consumer to pay excessive rates in order that the service to unprofitable consumers may be maintained. Your orator further shows that the said level or flat meter rate
21 system of charges, in the respects aforesaid, operates to deprive it of profitable business, which it could obtain from large consumers, if permitted to reduce its rates to them, after imposing a reasonable and equitable service charge, so that it would still maintain a fair profit above the station cost of manufacture. The said rate, while unreasonably low for small consumers, is prohibitive upon the large consumer, who has the alternative of using coal or other less expensive fuel; and so, without fault on your orator's part, it is by the said ordinance hindered from working or enjoying a profitable and desirable patronage, which it can only obtain through reasonable classification of its consumers or by permitting it to impose an equitable service charge upon all consumers adequate in the aggregate to maintain its fixed charges other than the station cost of manufacture of gas, and then establishing a lesser rate for gas to be added in all cases to the service charge.

2. The maximum monthly charge of 25c per month for a single service permitted by said ordinance is arbitrary and unreasonably low, and is inadequate and insufficient to defray the actual cost to your orator of maintaining its meter and service and connection with its plant on account of each individual service established and maintained.

3. By the terms of said ordinance, your orator is required to extend credit to all consumers of gas for a period of six days from and after preparing and furnishing to the consumer a bill or statement, and is required, as a condition precedent to receiving or collecting any funds whatever, to be at the expense of preparing and delivering to each customer a bill or statement six days in advance of receiving any compensation; and your orator is thereby denied the
22 usual necessary and customary privileges of offering a reward, by discount or otherwise, to customers presenting themselves at its office and making payment in such manner as to save your orator the cost of employing messenger service to deliver statements of account to its patrons; said ordinance denies to your orator all right of collection for services rendered to such of its customers who change their places of residence without notice to it, and whose whereabouts are thereafter unknown to your orator; and said ordinance denies to your orator right and power to demand and receive a security or deposit in advance from its individual consumers of sums reasonably adequate to indemnify your orator for the actual cost incurred in setting a meter and disconnecting it and to cover reasonable charges for meter rent and service and for the probable value of gas to be consumed during the reasonable or enforced term of credit; and by said ordinance your orator is denied the right to refuse to supply gas to delinquents refusing payment for prior service. In all the aforesaid respects, the said ordinance, in fact, requires your orator to give said service without any compensation and

all of the said regulations are unreasonable and unlawful and operat as a confiscation and condemnation of your orator's properties t public uses without compensation.

4. In the said city of Lincoln at the present time, at the time o the passage of said ordinance, and for a long time prior thereto, Th Lincoln Traction Company has operated and maintained and no operates and maintains a rival enterprise of offering and furnishin to the public electric light, heat and power, under a grant of franchis made to it by the City of Lincoln entitling it to the use of th streets, alleys, and public grounds of the said city wherein to con
struct, lay and maintain conduits for distribution of elec
23 tricity for said purposes. The said agency of electricity i thus actually employed by said Lincoln Traction Company for the same identical uses and purposes that gas is employed by you orator; and electricity so employed by said Traction Company unde said public franchises performs the same public uses and offices a does the gas manufactured and distributed by your orator in sai city. In the uses of electricity, the defendant, the city of Lincoln has at all times left the said Traction Company free to adopt such system of charges by classifying the customers in respect to the amount of current consumed, and to their being profitable or un profitable patrons, as the actual business experience of said Traction Company warrants, and as is requisite to enable it to obtain al profitable patronage available under such system and classification of charges as the said Traction Company sees fit to adopt; and to the knowledge and with the acquiescence of said city of Lincoln, the said Traction Company, in its said business so conducted in direct competition with your orator's gas business, actually employs an ade quate service charge sufficient to drive practically all of the un profitable consumers to the use of gas, to the pecuniary detriment of your orator, and actually offers to profitable consumers such favor able and reduced rates for current actually consumed as to induce large consumers to forego the use of gas, under the system of uniform charges operative alike to profitable and unprofitable consumers, prescribed by the defendant for the government of your orator's gas business, greatly to the pecuniary detriment and necessary loss of patronage of your orator. In this behalf, the said ordinance is dis criminatory and partial and is intended to operate and does operate to the disadvantage of your orator and to the great advantage of your orator's said competitor in business, and so denies to your orator the
equal protection of the laws.

24 And so your orator charges and shows unto Your Honors that the said ordinance so pretending to prescribe said regulations and to fix the maximum rate of $1.00 per 1,000 feet of gas to be charged by your orator to its consumers and patrons in said city is in each and every of the particulars aforesaid violative of Section 10 of Article 1 of the Constitution of the United States, providing that no state shall pass any law impairing the obligations of contracts, and of the fourteenth amendment to the constitution of the United States, providing that no state shall deprive any person of property without due process of law, nor deny to any person within

its jurisdiction the equal protection of the laws; each of which constitutional requirements are a part of the law of the land, and each of which limits, restrains and prohibits the granting by the State of Nebraska or the exercise of arbitrary power by defendant city of Lincoln for establishing gas rates inadequate to fairly compensate your orator and its bond holders and share holders for the public services rendered and required to be rendered and imposed upon it by the franchises, rights and privileges heretofore by said city granted to your orator; and from making partial and discriminatory regulations applicable alone to your orator, while at the same time leaving your orator's competitor in business free to exploit your orator's field of patronage without being bound, hindered or restrained by the same regulations which the defendant has applied to your orator; and from denying to your orator the like and equal protection of the law which the said city of Lincoln freely affords to your orator's competition in business. Wherefore, your orator, as advised by counsel, avers that the said ordinance and each and every part and provision thereof is, on the grounds aforesaid, inoperative and null and void.

25 Your orator further shows unto Your Honors that the certain ordinance heretofore referred to pretending to impose an onerous and burdensome occupation tax upon your orator, in addition to your orator's ad valorem property tax, the validity whereof is questioned by your orator, was passed by the city council of the defendant city on or about the 10th day of December 1906, and approved by the mayor, the defendant Francis W. Brown, and afterwards published, and is in the words and figures following:

"An Ordinance providing for and assessing an occupation tax upon all gas companies manufacturing and furnishing gas to the inhabitants of the City of Lincoln, fixing the amount thereof, providing for the enforcement and collection thereof and providing interest and penalty for non-payment when due and payable, and designating the funds to be credited with the amount so paid.

Be it ordained by the Mayor and Council of the city of Lincoln:

Section 1. That all gas companies manufacturing and furnishing gas to the inhabitants of the City of Lincoln are hereby required to pay an occupation tax, and the amount thereof as hereinafter specified is hereby assessed against said company or companies.

Section 2. That all gas companies manufacturing and furnishing gas to the inhabitants of the City of Lincoln are hereby required to pay the City of Lincoln as an occupation tax the sum and amount of Two and a half per cent (2½%) of the gross receipts of said company, derived from its business of manufacturing and furnishing gas to the inhabitants of the City of Lincoln, payment thereof is to be made as follows: Beginning with January 1, 1907 said gas company or companies shall on the 15th day of each and

26 every month thereafter pay the City of Lincoln Two and a half per cent (2½%) of the gross receipts of said gas company for the preceding month, as hereinabove provided, as an occupation tax, and all deferred payments shall draw interest at the rate of one per cent (1%) per month, and after payment has been in

default for six months, a penalty of five per cent (5%) shall be added thereto in addition to the interest charge, and shall be paid by said gas company or companies.

Section 3. All such gas companies on the 10th day of each month, as hereinabove provided, shall file with the City clerk a full, complete and detailed statement of the income and operating expenses and other charges of said gas company for the preceding month, and said statement shall be duly verified and sworn to by the managing officer of any such gas company or companies, and the City of Lincoln shall have the right at any and all times during business hours to inspect, thru its officers, agents, or representatives, the books and records of any such gas company or companies for the purpose of verifying such report or reports. Provided, however, that in case any such gas company or companies shall refuse, fail or neglect to furnish or file such report at the time or times specified, or shall refuse to permit the City of Lincoln, thru its officers, agents or representatives, to inspect the books and records of any such company for the purpose of verifying such report or reports, then and in that event the occupation tax for the preceding month shall be and is hereby fixed and determined to be the sum and amount of One Thousand Dollars and said amount shall draw interest at the rate of one per cent (1%) per month after due and payable, and in addition thereto a penalty of five (5%) per cent for failure to pay within six months.

27 Section 4. In case any such gas company or companies shall fail to make payment of the occupation tax as hereinabove provided, and at the time or times hereinabove specified, the City of Lincoln shall have the right and may sue any such gas Company or companies in any court of competent jurisdiction for the amount of occupation tax due and payable under the terms and provisions of this ordinance, and may recover therein a judgment against any such gas company or companies for the amount so due, together with interest and penalties, and may have execution thereon.

Section 4½. Said occupation tax shall be paid to the City Treasurer of the city of Lincoln, at the time specified in this ordinance and he shall issue and deliver a receipt therefor, upon the payment thereof, and the amount so paid shall be credited by the City Treasurer to the general fund of the city, unless otherwise directed by the Mayor and Council.

Section 5. All ordinances and parts of ordinances in conflict herewith are hereby repealed.

Section 6. This ordinance shall take effect on January 1, 1907, after its passage, approval and publication according to law."

The aforesaid ordinance pretending to levy said occupation tax is partial, discriminatory, unreasonable and oppressive in this: It imposes upon your orator an onerous tax burden to which the business and occupations of other persons within said city are not subjected. Otherwise than as the general methods of raising revenue by said city are varied by the said ordinance, the said defendant raises all its revenues by an ad valorem property tax levied upon all

the property in said city, including the properties of your orator, which are valued for the purposes of assessment at a sum exceeding
\$663,000. The said occupation tax so pretended to be im-
28 posed upon your orator is so burdensome and oppressive that
your orator cannot comply therewith nor pay the sums therein and thereby imposed out of the revenues permitted by the ordinances of said city to be collected for the public services rendered by your orator; and said ordinance, if enforced, will be prohibitive upon your orator's continuance in business, and will operate to utterly and wholly destroy all of your orator's privileges, rights and franchises heretofore, by the franchise ordinances herein mentioned, granted by the defendant city to your orator, and will deprive your orator of its said contract rights and privileges and of its properties without due process of law. The Lincoln Traction Company, a corporation heretofore organized under the laws of Nebraska, having its principal place of business at the said city of Lincoln, is at present and was at and prior to the date of the passage of said ordinance in full use and enjoyment of franchise rights granted by ordinance of said city, to construct, operate and maintain a plant and carry on the business of furnishing electricity to the public in said city for the uses of light, heat and power; and said traction company, at passage of said ordinance, had and now has a fully equipped plant for said purposes in operation, and is offering to and in fact supplying the public with light, heat and power, in direct and open competition with the gas business of your orator. The said ordinance was intended by the said city of Lincoln to discriminate against your orator in said lighting business and in favor of the said Lincoln Traction Company and to deprive your orator of the right and power to compete in its gas department with the said electric light, heat and power business of the said Traction Company, and, if permitted to be enforced, will operate as such discrimination, to the pecuniary embarrassment and ruin
of your orator's gas business. The said City of Lincoln has
29 not, by said ordinance or otherwise, subjected the light, heat
and power business of the Lincoln Traction Company to any occupation tax or to any tax other than the general ad valorem property tax imposed by said city, as aforesaid, upon all the taxable property therein.

Wherefore, your orator avers, as advised by counsel, that the aforesaid ordinance pretending to impose said occupation tax upon your orator, operates to deprive your orator of the equal protection of the laws, imposes a discriminatory burden upon your orator, not imposed thereby or by any other law upon your orator's competitor in business, and deprives your orator of its franchise rights and privileges and of its properties without due process of law, and, in all the respects aforesaid, is violative of the fourteenth amendment to the Constitution of the United States, providing that no state shall deprive any person of property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws, and also of Section 10 of Article 1 of the Constitution of the United

States, providing that no state shall pass any law impairing the obligation of contracts.

Your orator further shows unto your Honors that, notwithstanding the invalidity of the aforesaid ordinance pretending to prescribe said regulations and to fix said maximum gas rate of $1.00 per 1,000 feet, the defendants, the City of Lincoln, pretending to act in faith of its validity, the said Francis W. Brown, Mayor, in pretended exercise of his official duty to enforce the ordinances of said city and to call to his aid a posse comitatus to assist him in enforcement thereof, and the said Edmund C. Strode, city attorney, in pretended exercise of his official duty to commence and prosecute actions in behalf of said city in all courts and to appear, by order of the mayor and council, to prosecute complaints for offenses against the ordinances
30 of said city, threaten to and will, unless restrained by Your Honor's from so doing, direct, order, commence and prosecute sundry suits, civil and criminal, before the police judge of said city of Lincoln and in courts of general and limited jurisdiction in Lancaster County, Nebraska, against your orator and your orator's executive offices and manager to enforce the burdensome, excessive and ruinous penalties prescribed by said ordinances for a refusal and failure to comply with their terms; and to institute proceedings in the district and supreme courts of Nebraska to compel your orator and your orator's executive officers and manager, by mandamus, to carry into effect the provisions thereof; and by asserting and pretending that the said rate ordinance is valid as a proper exercise of the alleged power of said city to fix the price of gas, to instigate and incite its inhabitants and citizens and the consumers of gas therein claiming the rights thereunder to institute and prosecute suits of like kind and character against your orator, its executive officers and manager. All of which actings, doings and pretenses of said defendants are contrary to equity and good conscience, and tend to the manifest wrong, injury and oppression of your orator, who is remediless in the premises at and by the strict rules of the common law, which would subject your orator and its executive officers and manager to a multiplicity of suits by said defendants and by each and every one of the gas consumers of said city, and persons who may hereafter become consumers or desire so to do, many of whose names are to your orator unknown, and who are too numerous to be named or impleaded as defendants or brought before the court, all of whom will claim through and under the defendant the City of Lincoln and by virtue of the aforesaid pretended ordinance; and your orator can only have relief in a court of equity, where matters of this nature are properly cognizable.

31 Wherefore, your orator brings the foregoing bill against the City of Lincoln, Francis W. Brown, Mayor, and Edmund C. Strode City Attorney, and prays that the defendants and each of them may be compelled full, true and perfect answers to make unto all and singular the matters aforesaid as fully and particularly as if the same were hereinafter repeated and they distinctly interrogated; but not under oath, answer under oath being hereby expressly waived.

And may it please Your Honors to grant unto your orator a writ

of injunction pendente lite, issuing out of and in accordance with the rules and practice of this honorable court, to be directed to the said defendant, the City of Lincoln, Francis W. Brown, Mayor, and Edmund C. Strode, City Attorney, restraining and enjoining them and each of them, their agents, servants and employees, from in any wise obeying, observing or conforming to the provisions, commands, injunctions and prohibitions of said certain alleged ordinance of the City of Lincoln No. 432, entitled, "An Ordinance regulating the price of manufactured gas, establishing penalties for the violation of the provisions of this ordinance, and repealing all ordinances in conflict therewith;" and restraining them and each of them from instituting or prosecuting or causing to be instituted or prosecuted any action or proceding, civil or criminal, against your orator, its executive officers or manager, for any act or thing done, suffered or omitted, which may be forbidden or commanded by said ordinance, and particularly from reducing its present rate of charges for gas to those prescribed in said ordinance, until the further order and decree of this court, in the premises.

32 That on the final hearing thereof, the aforesaid ordinances and each of them, the one pretending to prescribe said maximum rate, and the other pretending to impose said occupation tax, be adjudged void, because repugnant to the said several provisions of the Constitution of the United States, and that said injunction be made perpetual.

And that your orator may have such further or other relief in the premises as the nature of the circumstances of this case may require, and to your honors shall seem meet and proper.

And so may it please Your Honors to grant unto your orator the most gracious writ of subpœna to be directed to the said the City of Lincoln, Francis W. Brown, Mayor of the City of Lincoln, and Edmund C. Strode, City Attorney of the City of Lincoln, thereby commanding them and each of them, at a certain date and under a certain penalty therein to be specified, personally to be and appear before your Honors in this honorable court, and then and there to answer all and singular the premises and to abide and perform such order and decree herein as to Your Honors shall seem meet.

HALLECK F. ROSE,
*Solicitor for Complainant.*

HALLECK F. ROSE,
*Of Counsel for Complainant.*

UNITED STATES OF AMERICA,
*District and State of Nebraska, Lancaster County, ss:*

Homer Honeywell, being first duly sworn, on oath says that the Lincoln Gas & Electric Light Company, complainant in the above entitled cause, is a corporation; that affiant is and for two

33 years last past has been its acting general manager in direct and immediate charge of its administration and affairs at the City of Lincoln, and that the presentation and prosecution of this bill has been expressly authorized by said company and its president;

that affiant is the officer of said company highest in authority at this time within the City of Lincoln and within the District of Nebraska; that affiant has read the foregoing bill of complaint and knows the contents thereof, and that the matters and things in said bill of complaint alleged are within affiant's personal knowledge, and that the same are true of affiant's own knowledge, except as to matters which are therein stated on information or belief, and as to those matters, that he believes them to be true.

HOMER HONEYWELL.

Subscribed in my presence and sworn to before me this 26th day of December, 1906.

[NOTARIAL SEAL.] MARY E. MORTIMER,
*Notary Public.*

34 *Restraining Order.*

Filed in United States Circuit Court, District of Nebraska, Lincoln Division, December 27, 1906.

Whereas in the above cause it has been made to appear upon the bill of complaint filed herein and the affidavit of Homer Honeywell that a writ of injunction preliminary to the final hearing is proper and prima facie the complainant is entitled thereto, enjoining defendants herein from the acts complained of and threatened to be committed; and it further appearing to the court that due notice of the filing of the motion for an injunction has been served upon all of the defendants, requiring them to appear before the Circuit Court of the United States for the District of Nebraska in the Eighth Circuit at the court room of said court in Lincoln on the 21st day of January, 1907, at 9 o'clock and 30 minutes A. M. then and there to show cause, if any they have, why the preliminary injunction therein prayed for should not issue; and it appearing to the undersigned district judge for the district of Nebraska of said circuit court that there is danger of irreparable injur*ing* caused to the complainant before the hearing of said application for the preliminary writ of injunction, unless the said defendants are, pending such hearing, restrained as hereafter set forth:

Therefore, complainant's application for such restraining order is granted upon its giving a bond with two good and sufficient sureties, to be approved by the clerk of this court in the penal sum of $3,000 securing the said defendants against all loss or damage which may result from the issue of said order if it shall be finally determined that the sa.ne was improperly issued or that may be awarded
35 to them by reason of the granting of said order:

Now Therefore, it is ordered that you, the said City of Lincoln, Francis W. Brown, Mayor, and Edmund C. Strode, City Attorney of said city, defendants herein, your agents, servants, attorneys, and all persons acting by or under your authority or direction, be and you hereby are specially restrained and enjoined from in any wise obeying, observing or conforming to the provisions,

commands, injunctions and prohibitions of a certain ordinance of the City of Lincoln, Number 432, entitled: "An ordinance regulating the price of manufactured gas, establishing penalties for the violation of the provisions of this ordinance and repealing all ordinances in conflict therewith," passed November 12, 1906 by the council of said city, and approved November 19, 1906 by the mayor, defendant Francis W. Brown; and from ordering, instituting or causing to be instituted or prosecuted any action or proceeding, civil or criminal, against the complainant, its executive officers or manager for any act or thing done, suffered or omitted which may be forbidden or commanded by the said ordinance, and particularly from reducing its present rate of charges for gas to those prescribed in said ordinance, until the further order of this court.

It is further ordered that a copy of this order, certified under the hand of the clerk and the seal of this court, be served on each of the defendants to be restrained thereby.

Dated at Omaha in the District of Nebraska this 27th day of December, 1906.

W. H. MUNGER,
*District Judge, District of Nebraska.*

36 *Answer.*

Filed in United States Circuit Court, District of Nebraska, Lincoln Division, May 13, 1907.

The defendants, the City of Lincoln, and its officers now and at all times hereafter, saving to itself all manner of benefits and advantages of exception or otherwise, that can or may be had or taken for the many errors, uncertainties and imperfections in the bill of the Lincoln Gas & Electric Light Company herein contained, for answer thereto, or to as much thereof as this defendant is advised and is material and necessary to make answer to, says:

1. Defendants admit that the complainant is a corporation organized under the laws of the State of Nebraska, for the purpose of owning and operating a light plant; and that the complainant succeeded to such property rights of the Lincoln Gas & Electric Company as it had power to alienate and that the latter company had previously succeeded to such property rights of the Lincoln Gas Company as it had power to alienate which last two corporations had previously to complainant's organization and existence, owned and operated lighting plants in this city. Admit that the ordinance, parts of which are set out in the bill of complaint, were passed by the mayor and council — the city of Lincoln, but defendants deny that such ordinances were legal and valid or conferred upon complainant's predecessors or either of them a perpetual franchise to use the streets and alleys of the City of Lincoln for the purpose of maintaining and operating a system of lighting by gas and electricity, as claimed in the bill of complaint, but on the contrary, defendants

aver the fact to be that such right was strictly limited to a
37 period of twenty-one years commencing March 9, 1872, and ending March 9, 1893, and the right of operating such lighting system and the use of the streets and alleys of the city therefor, since said last named date, has been by the sufferance only of the defendant city, and subject to termination at any time by it. Defendant says that this court in this proceeding is without jurisdiction to determine or adjudicate the franchise rights and privileges of the complainant and defendant saves to itself all manner of benefits and advantage of exception and objection to the jurisdiction of this court with respect thereto.

2. Defendants admit the passage of the ordinance by the City Council November 16, 1906, set out in the bill of complaint, whereby the price of gas to consumers in the defendant city, was limited to one dollar per thousand cubic feet, and alleges that the same ever since said date and now is a legal and valid ordinance and in full force and effect, except as the enforcement of the same is and has been restrained by the injunction granted by this Honorable Court.

Defendants aver that the statutes of the State of Nebraska, grant to the City of Lincoln the power to regulate and fix the price of gas to consumers, and the Mayor and Council are authorized, and it was made their duty to enact ordinances for that purpose, and defendants aver that the aforesaid ordinance was duly and legally enacted in pursuance to such grant of power and authority.

Defendants deny that the enforcement of the foregoing ordinance will so reduce complainant's earnings as to prevent it from paying a dividend upon its capital actually and necessarily required for the construction and equipment of its lighting system, and defendant alleges that the enactment of said ordinance with its provisions fixing the price of gas to consumers, as aforesaid, was and is a
38 reasonable exercise of the power vested in the defendant City, as aforesaid, by the legislature of Nebraska, and its enforcement will result in no wrong to complainant, and the limitation therein contained on the price of gas, is reasonable and just, and such price will cover the cost thereof, and in addition will pay the necessary expense of the operation of such lighting plant together with a reasonable dividend upon the reasonable and necessary cost of such plant; and defendants deny that such ordinance will deprive complainant of its property without due process of law, and deny that its provisions violated any of the provisions of the constitution of the United States.

3. Defendants admit that complainant's outstanding stock and bonds amount to more than two million dollars, but allege that the same are largely fictitious and watered and the same does not represent the amount of capital reasonably necessary to construct, equip and operate complainant's lighting system: that the replacement and present value thereof does not exceed five hundred thousand dollars, and said last named sum more than represents the capital necessarily invested in the construction, maintenance and operation of such a lighting system.

4. For further answer, defendants admit the enactment of the

ordinance on or about December 10, 1906, levying an occupation tax of two and one-half per cent annually upon the gross receipts of all gas companies operating in the City of Lincoln, but deny that such ordinance in its provisions is partial, discriminating, oppressive or unjust, and alleges that the same was duly and legally enacted and is a reasonable exercise of the power vested in the defendant by the constitution and statutes of the State of Nebraska; that the same is a legal and valid ordinance and is and has been in full force and effect except as its operation has been restrained by the injunction herein granted by this honorable court.

39 Defendants deny that such ordinance was passed by reason of any improper motive or influence, and den*ies* that defendants councilmen and mayor were moved to enact such ordinance by any unrighteous or unlawful motive or influence, and defendants except to *s*ll such allegations of complainant as scandalous, impertinent and immaterial matter, and an uncalled for reflection upon the officers of the City of Lincoln, and upon the dignity and standing of this court, in assuming that this honorable court would be influenced by such immaterial and scandalous matter. And defendants ask this honorable court to cause the same to be expunged from said bill of complaint.

Defendants further answering deny each and every allegation in the bill of complaint contained not herein specifically admitted or denied.

Wherefore the defendants having fully answered, confessed, traversed and avoided or denied all the matters in the said bill of complaint material to be answered, according to its best knowledge and belief, humbly prays this honorable court to enter its judgment, that this defendant be hence dismissed, with its reasonable costs and charges in this behalf most wrongfully sustained, and for such other and further relief in the premises as to this honorable court may seem meet and in accordance with equity.

CITY OF LINCOLN,
By EDMUND C. STRODE,
*Solicitor and of Counsel for Defendant.*

40 *Replication to Answer.*

Filed in the United States Circuit Court, District of Nebraska, Lincoln Division, June 22, 1907.

This repliant, The Lincoln Gas & Electric Light Company, saving and reserving to itself all and all manner of advantages of exceptions which may be had and taken to the manifold errors, uncertainties and insufficiencies of the *the* answer of the defendants, the city of Lincoln, and its said officers, for replication thereunto, saith that it does and will aver, maintain and prove its said bill to be true, certain and sufficient in the law to be answered unto by the said defendants, and that the answer of the said defendants is very uncertain, evasive, and insufficient in law to be replied unto by this repli-

ant; without that, that any other matter or thing in the said answer contained, material or effectual in law to be replied unto, and not herein and hereby well and sufficiently replied unto, confessed, or avoided, traversed or denied, is true; all which matters and things this repliant is ready to aver, maintain and prove as this honorable court shall direct, and humbly prays as in and by its said bill it hath already prayed.

HALLECK F. ROSE,
*Solicitor and Counsel for Complainant.*

41 *Memorandum Opinion.*

Filed in the Circuit Court of the United States for the District of Nebraska, Lincoln Division, March 20, 1909.

W. H. MUNGER, *D. J.:*

Complainant is a corporation organized under the laws of the state of Nebraska, owns and operates a gas plant in the City of Lincoln, Nebraska, and furnishes to its patrons gas for lighting, heating and power purposes. The City of Lincoln, in March 1872 granted unto the Lincoln Gas Company, a corporation, organized under the laws of the State of Nebraska, a franchise granting the use of the streets, lanes and alleys in the city, for the purpose of constructing and maintaining a gas plant, and said Lincoln Gas Company constructed a gas plant, of which the complainant about the year 1901, became the owner.

In November 1906, the City Council of the City of Lincoln passed an ordinance, providing that no gas company should charge, exact, demand or collect, from any consumer, for gas manufactured or sold in said city, more than the sum of one dollar net per one thousand cubic feet, which ordinance provided certain penalties for its violation, said ordinance to take effect and be in force from and after December 1st, 1906.

In December 1906, said City Council also passed an ordinance imposing an occupation tax upon all gas companies manufacturing and furnishing gas to the inhabitants of the city of Lincoln of two and one-half per cent upon the gross receipts of said company, said ordinance to take effect January 1st, 1907.

42 This action is brought to enjoin the enforcement of said ordinance, the jurisdiction of this court being invoked upon the ground of a federal question, in that the rate of one dollar for each one thousand cubic feet of gas will deprive complainant of its property without just compensation, in violation of the provisions of the Constitution of the United States.

The ordinance imposing an occupation tax is alleged to be unconstitutional in that it violates the provisions of section 6, Article IX of the Constitution of the State of Nebraska, which requires that such a tax shall be uniform upon persons and property, it being alleged that the Lincoln Traction Company operates and maintains

an electric lighting plant and furnishes to the city and its inhabitants electricity for light, heat and power purposes.

A large amount of testimony has been taken for the purpose of determining the value of complainant's gas plant, and the reasonable expense for operating the same. In determining for what amount the plant could be reconstructed I have accepted in the main the testimony of complainant's witnesses as being the most satisfactory, and I find that the plant could be reconstructed for the following sums:

| | | |
|---|---|---|
| Coal gas apparatus | $80,605.00 | |
| Water gas apparatus | 29,278.00 | |
| Mains in dirt streets | 90,578.00 | |
| Mains in paved streets | 130,027.00 | |
| Gas services, etc | 107,106.82 | |
| Gas meters in use | 36,282.90 | |
| Meter connections | 6,304.00 | |
| Piping for gas ranges | 16,500.00 | |
| | | $496,681.72 |
| Engineering expenses (2½ per cent) | | 12,417.04 |
| Real estate | | 4,000.00 |
| Present value of buildings | | 24,643.00 |
| Contingent expenses in construction | | 25,000.00 |
| Cost of organizing company | | 3,000.00 |
| | | $565,741.76 |

43 While the evidence as to the depreciation is somewhat vague and indefinite, I think, upon the items aggregating said $496,681.72, there should be deducted for depreciation ten per cent, amounting to the sum of $49,688.17, making the total present valuation of the plant $516,073.59; but it is apparent that, for the successful and economical operation of the plant, a certain amount of working capital is required. This amount I find to be $50,000.00 making the total value of complainant's investment, upon which it is entitled to a reasonable return, $566,073.59.

While it is true the testimony shows that the complainant has not such working capital but has purchased upon credit the supplies necessary to operate, yet I think that, in determining what is a reasonable compensation, a working capital should be considered.

I do not allow anything as a value of complainant's franchise. It does not appear from the allegations of the bill or proofs that anything was paid to the city for the franchise; the city simply granted to complainant, without compensation, the right to use the public streets and alleys for the purpose of constructing and operating its plant. This was a mere right and privilege to complainant and did not involve the expenditure of money. While it is true a franchise is a property right, which will protect complainant in its use of the streets and alleys for the purposes expressed, yet it involves no investment of money, complainant's investment being in its tangible

property under authority of the franchise, and the public ought not to be taxed for a privilege which it has voluntarily granted.

I do not think there is anything in the case of Wilcox vs. Consolidated Gas Co., 129 Sup. Ct. Rep., 192, which conflicts with this view. In that case the legislative enactment providing for
44 consolidation of various companies expressly required that a value should be given to the franchise of the respective companies. For that reason the court sustained the value of the franchise thus fixed, but refused to recognize any increased value accruing during subsequent years by reason of the large increase in the tangible property from extension etc.

Whether a rate of one dollar per thousand for gas would furnish an adequate return upon the investment of $566,073.59 would depend, of course, upon the net receipts which could be applied in dividends. The net receipts of the company for the year 1907 were $73,851.83—this on the basis of the company's charge of $1.20 per thousand. A reduction of twenty cents per thousand, as required by the ordinance, would have reduced the receipt, upon the amount of gas sold in 1907, in the sum of $35,873.26, thus reducing the profit to $37,978.57.

While the plant has been kept in a good state of preservation, needed repairs etc. having been fully made, and chiefly charged to expense account, something should be allowed as a fund to be set apart for what is denominated a "Depreciation Fund." This I find to be $8,000.00 per year, leaving the net sum applicable as dividends to stockholders the sum of $29,978.57, or fifty-two and a fraction mills on the dollar. This is on the assumption that the occupation tax of two and one-half per cent is invalid. The occupation tax of two and one-half per cent for the year 1907 would have amounted to $4,484.15.

This occupation tax I think invalid, as violating the Constitution of the State of Nebraska, requiring it to be uniform upon persons and property. In my judgment, an electric plant, which furnishes to the public light, heat and power should be classed the same as a gas plant, which furnishes to the public light, heat and power. The fact that one furnishes the light, heat and power by means of an electric current—the other by a current of gas—does not, in
45 my judgment, justify a difference in classification. So far as the patrons are concerned, it is results that are sought for, and it is results which the respective parties furnish the public—results being light, heat and power. (See as to classification, State vs. Farmers & Merchants Irrigation Co., 59 Neb., 1; Rosenbloom vs. State, 64 Neb., 342.

The ordinance imposing the occupation tax being, in my judgment invalid, no deduction should be made from the net revenues for that purpose.

It is claimed that the ordinance reducing the price of gas to one dollar per thousand fixes a flat rate to all consumers alike; that as to the smaller consumers, gas would be furnished at a loss; that for this reason, the ordinance is invalid.

If the total income derived from the rates prescribed by the ordi-

nance will yield a reasonable return to complainant, upon its investment, I do not think it can complain. (See Wilcox vs. Consolidated Gas Co., supra.)

It appears from the evidence in this case that complainant's outstanding bonded indebtedness is $1,129,000.00, and that its stock is $2,500,000.00. The stock and bonds are each grossly in excess of the value of complainant's plant and grossly in excess of the cost of construction. Complainant's construction account shows that the entire cost of the plant to June 30th, 1907, was $603,278.14. The evidence shows that complainant and its predecessor, to obtain money with which to construct the plant, sold its bonds and stock at an enormous discount, and I do not think that, in determining the reasonableness of rates the amount thereof should be considered. While complainant, I think, is entitled to at least six per cent upon the money invested, it does not appear that
46 the reduced rate would not yield that sum. It is quite probable that the reduced rate would considerably increase the consumption of gas and thus increase complainant's net profits.

The record shows that in June, 1904, complainant voluntarily reduced its rates from approximately $1.50 per thousand to $1.20, and the amount of gas consumed, and net profits resulting, considerably increased. The inquiry in cases of this character is not alone what has complainant theretofore earned but it is what will be the effect of the ordinance reducing the rate upon the future net earnings of the company, and it devolves upon complainant to show not that the past rates have not produced a reasonable return but that the rate prescribed by the ordinance will not in the future produce a reasonable return.

The questions involved in this case, I think, have been recently disposed of by the Supreme Court, in the case of Knoxville vs. Knoxville Water Co., 29 Sup. Ct. Rep., 148; Wilcox vs. Consolidated Gas Co., id., 192; Railroad Commission of La. vs. Cumberland Telegraph & Telephone Co., decided February 23rd, 1909.

The question as to whether or not complainant's franchise is a perpetual one or has already terminated has been argued but that question is not properly involved in the case. The ordinance prescribing the rates to be charged, in effect, admits that complainant is properly occupying the streets and alleys, and whether such occupancy is by reason of a perpetual franchise or by sufferance, is not involved in the proper determination of this case.

For the reasons given, an injunction will be awarded against the enforcement of the ordinance imposing an occupation tax. The bill in all other respects will be dismissed without prejudice to the bringing of a new action when it is shown, after compliance with the ordinance fixing rates that such rates will not yield a reasonable return to complainant.

47 Counsel for defendant will prepare the proper decree and submit it to counsel for complainant before presenting to the court for signature.

*Decree.*

Filed in the Circuit Court of the United States for the District of Nebraska, Lincoln Division, April 6, 1909.

This cause came on for hearing upon the pleadings and the evidence and the argument of counsel having heretofore been submitted to the court, and upon due consideration whereof the Court finds for the defendants and finds no equity in the bill of complainant, so far as the same relates to the ordinance of the City of Lincoln establishing a rate of charge for gas in such city, and the same is hereby dismissed and the restraining order heretofore granted against the enforcement of such ordinance is hereby dissolved, without prejudice to the commencement of a new action.

The Court further finds that the ordinance of the City of Lincoln levying an occupation tax against the complainant violates the constitution of the State of Nebraska and is for that reason illegal and void, and that the enforcement of the same as to complainant should be perpetually enjoined.

It is therefore adjudged and decreed that a permanent injunction be and the same is hereby granted perpetually enjoining the City of Lincoln from enforcing said occupation tax ordinance.

It is further adjudged that the complainant pay the costs of this action.

WM. H. MUNGER, *Judge.*

Clerk:

Enter this decree.

WM. H. MUNGER, *Judge.*

48 *Petition for Allowance of Appeal.*

Filed in the United States Circuit Court, District of Nebraska, Lincoln Division, April 10, 1909.

The above named complainant conceiving itself aggrieved by the order and decree made and entered in the above entitled cause on the — day of April 1909, wherein and whereby it was ordered, adjudged and decreed that so far as the complainant's bill related to the ordinance of the city of Lincoln establishing a rate of charge for gas in such city was dismissed and the restraining order theretofore granted against the enforcement of such order was dissolved, and the costs of said action were adjudged against the complainant herein, amounting to $—, does hereby appeal from said order and decree from the — day of April, 1909, to the Supreme Court of United States of America, for the reasons specified in the assignment of errors filed herein, and it prays that this appeal may be allowed, and that a transcript of the record, papers and proceedings upon which said order

and decree was made duly authenticated, may be sent to the Supreme Court of the United States of America.

HALLECK F. ROSE AND
E. C. STRODE,
*Solicitor- for Complainant.*

49 *Assignment of Error.*

Filed in the United States Circuit Court, District of Nebraska, Lincoln Division, April 10, 1909.

Comes now the complainant and files the following assignment of error upon which it will rely upon its appeal from the decree made by this honorable court on the — day of April, 1909, in the above entitled cause.

1. That the United States Circuit Court in and for the district of Nebraska erred in dismissing complainant's bill, in so far as it relates to the ordinance of the City of Lincoln establishing a rate of charges for gas in such city.

2. In dissolving the restraining order theretofore granted by said court against enforcement of the ordinance of the City of Lincoln establishing a rate of charges for gas in such City.

3. In finding and determining that the plant of the complainant could be reconstructed for the sum of $565,741.76.

4. In finding and determining that there should be deducted from the said $565,741.76 the sum of $49,688.17 for depreciation.

5. In finding and determining the present value of complainant's plant to be $516,073.59.

6. In finding and determining the present value of complainant's buildings to be $24,643.00, the proof showing affirmatively that the cost of said buildings and the present value thereof to be $37,-286.00.

50 7. In finding and determining the value of the meter connections to be $6,304.00, the proof showing affirmatively the cost and value thereof to be $13,184.00.

8. In finding and determining the item of contingent expense to be $25,000.00, the proof showing affirmatively the item to be $67,-884.09.

9. In finding and determining the cost of organiz-ng the Company to be $3,000.00 the proof showing affirmatively the cost to be $24,-950.00.

10. In finding and determining that nothing should be allowed as interest on the money employed in constructing the plant during the course of its construction, the proof showing affirmatively the item to be $31,550.00.

11. In finding and determining that nothing should be allowed covering the expense of obtaining the money for the original cost of complainant's plant, the proof showing affirmatively the item to be $149,512.10; and in finding and determining that should be nothing allowed in the way of interest on the above item, the proof showing affirmatively the amount to be $7,500.00.

12. In finding and determining that nothing be allowed for the franchise in fixing and determining the value of complainant's property or plant, the proof showing affirmatively the value of such franchise was in excess of $100,000.00, and that the complainant was taxed thereon by the City of Lincoln on a valuation of $60,000.00.

13. In finding and determining that the complainant should be allowed for depreciation on its plant or property the sum of $8,000.00 per year only, the proof showing affirmatively that a reasonable annual sum for such depreciation would be five per cent of the value of complainant's property.

51 14. In finding and determining that the ordinance in question was valid, notwithstanding the proof showing affirmatively that under the ordinance the complainant would be required to serve more than seventy-five per cent of its patrons at less than cost.

15. In finding and determining, based on the earnings for the year 1907, that fifty-two and a fraction mills net profits on the valuation found and determined by the court would not deprive complainant of its property without just compensation, in violation of the provisions of the constitution of United States.

16. In not finding and determining the validity of complainant's franchise, and the life of said franchise.

17. In not finding and determining the validity of the ordinance, based on the value of complainant's property and the net earnings thereof as of the date said ordinance was passed and took effect according to its terms, to wit: December 1, 1906.

In order that the foregoing assignment of errors may be and appear of record the complainant presents the same to the court, and prays that such disposition be made thereof as in accordance with law and the statutes of the United States in such cases made and provided and complainant prays a reversal of the decretal order and decree of dismissal made and entered by said court, as hereinbefore set forth and referred to.

HALLECK F. ROSE AND
E. C. STRODE,
*Solicitor- for Complainant.*

52 *Order Allowing Appeal.*

Filed in the United States Circuit Court, District of Nebraska, Lincoln Division, May 27, 1909.

This cause came on for hearing this 5th day of May 1909, upon the application of the complainant for an allowance of an appeal to the Supreme Court of the United States, and for the fixing of a supersedeas bond, and upon consideration whereof it is ordered that said appeal be and the same hereby is, allowed, upon fixing a cost bond in the sum of Two Hundred and Fifty Dollars ($250.00); it is further ordered that the injunction heretofore granted be restored and continued in force until the appeal is heard and determined in the Su-

preme Court of the United States, provided, the Complainant, the Lincoln Gas and Electric Light Company, shall, within twenty days from this date make and file in this court a good and sufficient bond with approved sureties in the penal sum of One hundred and fifty thousand Dollars ($150,000.00), payable to the Clerk of this court and his successors in office, for the benefit of all whom it may concern, conditioned that, in the event that the decree heretofore entered herein dismissing complainant's bill is affirmed by the Supreme Court of the United States, it will, on demand, pay to the party or parties entitled thereto all overcharges for gas which it may have exacted in violation of Ordinance No. 432 of the City of Lincoln, regulating the price of manufactured gas and fixing the price thereof at One Dollar per thousand cubic feet, passed November 12th, 1906, by the Council of said City and approved November 19th, 1906, by the Mayor, and taking effect January 1st, 1907, since injunction was first awarded herein, to-wit, December 27th, 1906 and that it will in like manner pay to the parties entitled thereto all such over-
53 charges, if any it may continue to exact in violation of said ordinance during the pendency of the appeal, said obligation to become void if the ordinance be pronounced void by the Supreme Court of the United States.

Dated this 5th day of May, 1909.

WM. H. MUNGER, *Judge.*

54 *Motion to Change Counsel.*

Filed in the Circuit Court of the United States, District of Nebraska, at Lincoln, June 19, 1909.

Comes now the complainant and moves the court for an order substituting the name of John M. Stewart for the name of Edmund C. Strode, as one of the defendants in the above entitled proceedings.

The complainant also presents herewith a certified copy of the council proceedings of the City of Lincoln with respect thereto.

The complainant asks that the order be made substituting the name of John M. Stewart, City Attorney as defendant, and that the Clerk of the Court be authorized and directed to substitute said name of John M. Stewart as defendant in the transcript and record in the proceedings of this case.

LINCOLN GAS & ELECTRIC LIGHT CO.,
By E. C. STRODE, *Its Atty.*

Request to change counsel in gas rate suit, H. F. Rose, Clerk, read the following communication:

"To the Hon. Mayor & Council of the City of Lincoln:

Owing to my removal from Lincoln, and my special employment as attorney for the Burlington Railroad, I find it burdensome to me personally to continue full responsibility for the prosecution of the Gas Rate Suit. Former City Attorney E. C. Strode, Esq., who suc-

ceeds me as attorney for the Gas Co. was in office when this suit was commenced, but has taken no active part in the conduct of the case, the answer having been drawn and proofs taken by the present city Attorney. If deemed consistent I respectfully request that
55 the City consent that Mr. Strode's appearance in this suit for the City be withdrawn and that he may appear as counsel for the Gas Company in the further proceedings to be had therein, provided, that such course is agreeable to the present City Attorney.

Respectfully, HALLECK F. ROSE."

Hoppe: Moved that the communication be referred to the Legal Dept. Seconded by Hauschildt.

City Attorney Stewart, being called for, stated that it did not make any difference to him whatever, and that it would not prejudice the interest of the City whoever appeared against him in the case.

George: Moved as a substitute that the request be granted. Seconded by Castle and carried by the following vote; Ayes; Bauer, Bishop, Castle, George, Hauschildt, Leonhardt, Quiggle, Sawyer, Woodward. Nays: Hoppe, Hutton.

STATE OF NEBRASKA,
*Lancaster County, ss:*

I do hereby certify that the foregoing is a true and correct copy of the minutes, in part, of the Council proceedings, under date of May 4, 1908, as shown by the records and files in the office of the City Clerk.

Witness my hand and official seal this 19th day of June, 1909.

[OFFICIAL SEAL.] R. C. OZMAN,
*City Clerk.*

56 United States Circuit and District Court, District of Nebraska.

OMAHA, June 28th, 1909.

J. H. McClay, Esq., Deputy Clerk, U. S. Court, Lincoln, Nebraska.

DEAR SIR: Yours of the 19th enclosing motion in case of Lincoln Gas & Electric Light Co. vs. City of Lincoln, to substitute the name of John M. Stewart for the name of Edmund C. Strode, came while I was at North Platte. You may enter an order upon stipulation by Mr. Stewart and by Mr. Strode, substituting Mr. Stewart in the place of Mr. Strode.

Yours truly,

WM. H. MUNGER.

Papers returned herewith.

57 *Mandate from the Supreme Court of the United States.*

Filed in the District Court of the United States, District of Nebraska, Lincoln Division, April 10, 1912.

UNITED STATES OF AMERICA, *ss:*

[OFFICIAL SEAL.]

The President of the United States of America to the Honorable the Judge of the District Court of the United States for the District of Nebraska, Greeting:

Whereas lately in the Circuit Court of the United States for the District of Nebraska, in a cause between Lincoln Gas & Electric Light Company, complainant, and The City of Lincoln, Francis W. Brown, Mayor, and Edmund C. Strode, City Attorney of said City of Lincoln, Defendants, wherein the decree of the said Circuit Court, entered in said cause on the 6th day of April, A. D. 1909, is in the following words, viz:

"This cause came on for hearing upon the pleadings and the evidence and the argument of counsel having heretofore been submitted to the court, and upon due consideration whereof the Court finds for the defendants and finds no equity in the bill of complainant, so far as the same relates to the ordinance of the City of
58 Lincoln establishing a rate of charges for gas in such city and the same is hereby dismissed and the restraining order heretofore granted against the enforcement of such ordinance is hereby dissolved, without prejudice to the commencement of a new action.

The Court further finds that the ordinance of the City of Lincoln levying an occupation tax against the complainant violates the constitution of the State of Nebraska and is for that reason illegal and void, and that the enforcement of the same as to complainant should be perpetually enjoined.

It is therefore adjudged and decreed that a permanent injunction be and the same is hereby granted perpetually enjoining the City of Lincoln from enforcing said occupation tax ordinance.

It is further adjudged that the complainant pay the costs of this action.

(Signed) WM. H. MUNGER, *Judge.*"

as by the inspection of the transcript of the record of the said circuit court, which was brought into the Supreme Court of the United States by virtue of an appeal taken by said complainant agreeably to the act of Congress in such case made and provided, fully and at large appears.

And whereas in the present term of October, in the year of our Lord one thousand nine hundred and eleven, the said cause came on

to be heard before the said Supreme Court, on the said transcript of record, and was argued by counsel:

On consideration whereof It is now here ordered, adjudged, and decreed by this Court that the decree of said Circuit Court in this cause be, and the same is hereby reversed with costs; and that the said complainant, The Lincoln Gas & Electric Light Company, re-
cover against the said defendants One thousand six hundred
59 and fifty-one dollars and twenty-five cents for its costs herein expended and have execution therefor.

And it is further ordered that this cause, be and the same is hereby, remanded to the District Court of the United States for the District of Nebraska, with directions to refer the case to a competent and skilled Master, to report fully his findings upon all of the questions raised by either party, separately, and with leave to both parties to take any additional evidence they may wish within a time to be fixed by that court, and that that court, upon such report, proceed as equity shall require.

It is further ordered, adjudged and decreed for the protection of all parties that the injunction granted in the court below continue in force until final decree there, upon condition that the appellant enter into a new bond, with surety satisfactory to the court below, to account for all overcharges to consumers since the original restraining order in the event the ordinance shall be sustained, and that if such bond be not made within twenty days after the filing of the mandate of this Court that the injunction stand dissolved.

FEBRUARY 19, 1912.

You therefore, are hereby commanded that such execution and further proceedings be had in said cause, in conformity with the opinion and decree of this Court as according to right and justice, and the laws of the United States, ought to be had, the said appeal notwithstanding.

Witness the Honorable Edward D. White, Chief Justice of the United States, the 23d day of March in the year of our Lord one thousand nine hundred and twelve.

*Clerk of the Supreme Court of the United States.*

61 *Order of Court Appointing J. J. Sullivan, Master.*

Filed in United States District Court, District of Nebraska, Lincoln Division, July 15, 1912.

It is hereby ordered that the above case be referred to Honorable John J. Sullivan as master, to take the proofs, report the same to the court with his findings of fact and law, with all convenient dispatch.

WM. H. MUNGER, *Judge.*

62 *Report of Special Master.*

Filed in United States District Court, District of Nebraska, Lincoln Division, September 8, 1914.

The ultimate and determinative question in this case is the validity of an ordinance of the City of Lincoln reducing the rate of gas to consumers from $1.20 to $1.00 per M cubic feet. The ordinance was, by its terms, effective December 1st, 1906, but prior to that date, the gas company secured an order enjoining the city authorities from putting the reduced rate into effect. This order is still in force. There is also, incidentally involved in the case the constitutional validity of an occupation tax ordinance which, by its

terms, took effect January 1, 1907. This latter ordinance is assailed upon the ground that plaintiff's competitors in the busness of furnishing light by electricity is not subject to a like burden, and that the tax imposition is, therefore, discriminatory and denies plaintiff an equal protection of the law contrary to the Fourteenth Amendment. After the case was remanded by the Supreme Court (Lincoln Gas & Electric Light Co. vs. City of Lincoln, 223 U. S. 351) the undersigned, acting under the authority of an order of this court appointing him Special Master, heard and considered the
63 evidence and arguments of counsel, and now submits for the consideration of the Court the following report dealing with the valuation of the company's property employed in the production and distribution of gas in the City of Lincoln, together with the cost and expense of conducting the business, and the gross and net earnings derived therefrom.

## Preliminary Observations.

An enormous mass of evidence, much of it bearing rather remotely upon the questions in dispute was collected and submitted during a trial of extraordinary length. A summarization of this evidence is quite impossible and would, so far as I can see, aid neither court nor counsel in testing the correctness of the conclusions which I have reached. To give the names of witnesses together with what I might conceive to be fair condensation of their testimony upon any controverted point would, as I view it, be altogether valueless. Instead of pursuing this course, it has seemed to me better, generally, in dealing with valuation, to make findings with respect to small subdivisions of the company's property, reciting evidence and giving reasons only when it is thought that court or counsel may be thereby substantially assisted in determining whether any such finding should be approved, revised or rejected. The evidence, which is for the most part opinion evidence, and generally unreconcilable, makes my conclusions in regard to values, at best, nothing more than fair approximations. The fact that those conclusions may, perhaps, be made the basis of a decree
64 annulling legislative action upon constitutional grounds has duly impressed me with the necessity of being cautious and conservative in fixing values which, while entirely just to the company, do not go beyond the figures fairly indicated by the proof. In other words, I have, in considering the case, kept constantly in mind the fundamental doctrine that a rate ordinance cannot be rightfully condemned by judicial sentence unless it is shown that there is no just or fair doubt about its confiscatory character. Whoever accuses rate legislation, must make his accusation good by producing the requisite quantum of proof. We must make a frank and full disclosure of all the relevant facts in his possession or under his control. The conduct of the company at the trial of this case has hardly measured up to this somewhat exacting, but just standard. It appears that Mr. Stone of the firm of Stone, Huddle & Company of Madison, Wisconsin, a firm engaged generally in the busi-

ness of valuing public utilities, was employed by plaintiff during the pendency of this litigation, to make an investigation into its property, business or affairs. The exact scope of the employment is not disclosed, but it does appear that Mr. Stone rendered services and made a report for which he was paid a fee of $2,600.00. Plaintiff refused at the trial to produce the report or give any information with respect to it. Whether this conduct constitutes technically a suppression of evidence, I do not determine for I have not grounded any presumption or inference upon it. It has, however, emphasized the need of exercising more than ordinary care to see, where the validity of a law or ordinance depends upon disputed questions of fact, that the dispute be not resolved against the legislation where there is any reasonable doubt about what the truth is.

65 The contention has been made on behalf of the City that there are a number of plant items which ought not to be valued on the basis of reproduction cost, but on the basis of the cost new or more modern and equally efficient substitutes of a different type. I have not adopted this view, but have instead valued all such items as they actually exist. The property whose valuation is here involved is, of course, the aggregation of things owned by the company and used by it in serving the public. Rates should, therefore, it seems to me, be based upon the value of those things rather than upon the value of other things performing like functions with equal or greater efficiency.

My valuation of the physical property is based on the Broadnax inventory. Specific reference to whatever items are excluded from it is hereinafter made and my reason given for the exclusion.

Generally, in making computations, I have, for convenience, whenever the consequence would be plainly negligible, used round numbers instead of exact figures.

## Overhead Charges.

In ascertaining the value of the property of a public service corporation it is, the recognized and approved practice to add to the fundamental cost of the physical equipment, excepting real estate and working capital, a proper percentage to cover overhead expenses. This percentage represents the difference between the net construction cost and the cost of reproduction new. Just what it should be

66 is the question about which there is much difference of opinion among engineers, courts and commissions. In this case, Mr. Lea puts it at sixteen per cent, and Mr. A. D. Adams at seven per cent. The matter is not governed by any inflexible rule, but is to be determined in every case by the exercise of good sense and sound discretion. The amount should be sufficient rather than liberal, especially where liberality might result in blotting out legislation which, in the regulation of rates, is only required to stop just short of confiscation. The property was inventoried by Mr. Broadnax, an employee of the company and a gas engineer of long experience. The work seems to have been done with unusual thoroughness. The only error discovered during the course of the long trial was one of inclu-

sion; there was none of exclusion. My judgment upon the matter is that an allowance of twelve and a half per cent on the total net construction cost of the physical property, excepting real estate and working capital, is sufficient to cover all overhead expenses including engineering, superintendence, legal expenses, taxes, interest during construction, omissions and contingencies, casualty liability and whatever else is usually classified under this caption. This is necessarily an estimate based almost entirely upon expert testimony. No accounts were kept and no books, vouchers or other evidence produced showing with even approximate accuracy what expenditures were actually made and properly chargeable to this account. The value of the property has substantially increased by addition made to it in recent years, but the only means of ascertaining what the overhead charges on account of such additions were, is by the use of a more or less reliable hypothesis. Courts and commissions differ widely
67 upon this question; and while it may be that the percentage here allowed is not enough, the evidence does not convince me that it ought to be more. I come now to the question of physical valuation. The physical property was, for the purpose of being inventoried and appraised, divided into four groups, namely:

(1) Real Estate,
(2) Buildings,
(3) Works Equipment, and
(4) Distribution System.

These groups inclu-e the whole of the physical property excepting only what goes into Working Capital. The valuation is of January 1, 1913.

## Real Estate.

Taking up first the real estate, which is, in making the valuation, considered as denuded of all improvements used in, or connected with, the manufacture or distribution of gas, I find that it consists of eight different tracts. Upon this property, Henry I. Lea, the gas engineer, who made the general appraisement, for the company, placed a valuation of $19,320.00. This figure was fixed upon by Mr. Lea after inquiry among real estate dealers and others having knowledge of land values in and about Lincoln. Its substantial correctness is vouched for in detail by other witnesses testifying on behalf of the company. On the other hand, Mr. A. D. Adams, consulting gas engineer, testifying for the City, fixed the value of Lots 1 to 12 inclusive Block 79, which the City claims is the only real estate devoted to the gas business, at $2,625.00. This estimate though obviously too low for the lots embraced in it, is supported to a con-
68 siderable extent by witnesses for the City. The local witnesses were all men of fair intelligence, evident candor, and qualified by observation and experience to give evidence entitled to serious consideration. In circumstances of this kind there is, of course, no means by which a court can with precision lay its finger on the truth. The most it can do, in the light of the opinions given by others, is to express an opinion of its own. In my judgment $16,250.00 is a fair allowance to plaintiff for all the real estate which it

claims is devoted to, or properly chargeable against the gas business. It is contended by counsel for the City that the only real estate used or useful in the manufacture or distribution of gas in the City of Lincoln are Lots 1 to 12 in Block 79, and that the other lots embraced in the inventory ought not for the purposes of this case, to be counted as part of the utility. I do not accept this view. It is true, as counsel assert, that the property in question is not all actually used at this time in the gas business, but there is considerable probability that it, or at least the greater part of it may be in the not far distant future. It stands waiting, and may, perhaps, be regarded as constructively in service. But assuming that the acquisition of some of the lots was due to an error of judgment, I do not think they ought for that reason to be excluded from the valuation. The judgment of the court upon the action of the company ought not to be too harsh; it ought to be tempered by the consideration that the company put in its own money in good faith, and that infallibility is not a human attribute.

69 Some of the lots were bought to avoid threatened litigation, and I am not prepared of the evidence in the record to say that the purchase was not dictated by sound business judgment.

### Buildings.

The property embraced in this caption is subdivided into nine parts upon each of which is fixed a valuation which, under the evidence, I consider fair and just.

### Purifying House.

The reproduction cost of this building, according to Lea, is $19,279.00; according to A. D. Adams $13,457.00. The net construction cost, according to Assenmacher, a witness for the City, is $12,482.00. I find the reproduction cost to be $16,700.00 and the present value $13,200.00.

### Generator House.

Mr. Lea's estimate of the reproduction cost of this building is $4,337.00; Mr. A. D. Adam's $3,489.00, and Mr. Assenmacher'- estimate of the net construction cost is $3,308.00. I find the cost of reproduction to be $4,000.00 and the present worth $3,800.00.

### Retort House.

The reproduction cost of this building is put by Mr. Lea at $8,919.00, by Mr. Adams at $6,515.00, while Mr. Assenmacher's estimate of net construction cost is $6,080.00. I fix the reproduction cost at $7,500.00, and the present worth at $6,375.00.

### Meter Shop and Booster House.

The reproduction cost of this structure is, according to Lea, $3,035.00; according to Adams $2,192.00; and its net construction cost,

according to Assenmacher, is $2,559.00. I fix the reproduc-
70 tion cost at $2,850.00 and present worth at $2,660.00.

### Coal Shed.

The reproduction cost of the coal shed is, according to Lea, $2,-080.00; according to Adams $1,773.00; and the net construction cost is, according to Assenmacher, $1,892.00. I fix the reproduction cost at $2,080.00, and the present value at $520.00.

### Oil Tank House.

Lea's figure on reproduction cost of this structure is $1,807.00; Adams' $1,185.00; and Assenmahcer's for net construction cost $1,-276.00. I fix the reproduction cost at $1,807.00, and the present value at $1,500.00.

### Stable and Blacksmith Shop.

Lea's estimate of reproduction cost of this item is $549.00; Adams' $875.00; and Assenmacher's for net construction cost $907.00. I fix the reproduction cost at $949.00 and the present value at $193.00.

### District Holder and Booster House.

I find the reproduction cost of this item to be $811.00 and the present worth at $770.00.

### Oxide Shed.

The oxide shed would cost $70.00 to reproduce new, and its present worth at $63.00.

Total present value of buildings, $29,381.00.

### Works Equipment.

The property here included consists of seventy-three items.
71 The evidence of values comes principally from the experts. Lea and Adams, and clashes irreconcilably at almost every point. In considering the evidence of these experts, I have been aided, of course, by the testimony of other witnesses and by reports, letters, bills, contracts, vouchers and other documentary proofs. Upon every disputed item all the evidence, oral and written which I have been able to find in the record has been examined, considered and given in the decision reached its proper weight of influence. After ascertaining the reproduction cost which is in the aggregate $198,868.00, and making proper deductions for depreciation I present here without discussion of the evidence my conclusion that the present value of the seventy-three units which compose this division of the company's property is $179,310.00. I give also the depreciated value of each unit.

Value as of January 1, 1913.

The City claims that the East Lincoln gas holder should be excluded from the list of property employed in supplying gas to the people of Lincoln. This claim is grounded upon evidence tending to show that the company had, as a primary motive for its erection, the extension of the gas business into territory outside of the corporate limits of Lincoln, and to enable the Company to render better service to its patrons in such territory. This motive was, I think, a factor and perhaps an influential one in bringing about the erection of the holder; but it is indisputably an item of equipment of substantial value to the people of Lincoln; it is used and useful in supplying them with gas, and it does not seem just to the company to exclude it from the valuation, because one of the reasons in which it had its origin did not regard their interests. Viewed broadly and equitably, its acquisition cannot, for the purpose of this case, be considered as unnecessary or improvident.

Distribution System.

Mr. Lea's estimate of the net construction cost of mains laid in unpaved streets is $179,814.00; Mr. Adams' $130,913.00. I
75 have allowed $173,700.00. Lea's estimate of the net construction cost of total services is $111,689.00; Mr. Adams' $69,939.00. I have allowed $76,116.00. For service and boxes and cocks, I have allowed $9,000.00; for total service governors, $18,950.00; for total meters $60,500.00; for distribution tools $6,210.00; for street main drips $1,113.00; for street main valves $328.00; for district governors $225.00; for railway crossings $2,800.00; and for gas appliances loaned $3,250.00, making a total of $352,192.00 as the net construction cost of the Distribution system. The difference between the total cost as fixed by me and the total cost according to Mr. Lea ($529,736.00) consists for the most part in the elimination from Lea's figures of three items, namely:

(1) 3½ per cent excess overhead;
(2) The cost of paving over mains and services; and
(3) The cost of service pipes paid for by patrons of the company.

Adding the 12½ per cent overhead charge to the net construction cost of $352,192.00 given $396,216.00 as the total reproduction cost of the distribution system; and its depreciated value or present worth I find to be $351,624.00.

That no allowance can be made in a rate case for the reproduction cost of paving over mains and service pipes seems now to be established by the clear weight of judical and administrative authority.

Cedar Rapids Gas Light Co. vs. Cedar Rapids, 134 Iowa, 426.
Des Moines Gas Co. vs. City of Des Moines, 199 Fed. 204.
People vs. Wilcox, 104 N. E. (N. Y.), 911.
76 Whitten on Valuation of Public Service Corporation, Chapter VII.

The better reason too seems to be against such allowance. To permit a public service corporation to justify a rate claimed to be excessive by pointing to a costly street improvement made by the public at its own expense hardly accords with good sense. The public would be reluctant to make such improvements if they result not only in increasing taxation, but in an increase of gas and water rates as well.

Whether the reason for excluding the cost of pavement over mains from the valuation requires also the exclusion of the cost of service pipes paid for by the gas consumers has not, to my knowledge, been adjudicated; but the governing principle is, it seems to me, as applicable in one case as in the other. As was said in Smyth vs. Ames, 169 U. S. 466:

"What the company is entitled to ask is a fair return upon the value of that which it employes for the public convenience. On the other hand, what the public is entitled to demand is that no more be exacted from it than the services rendered are reasonably worth."

Of course, in valuing a utility, no distinction can be made between property acquired by purchase and property acquired by gift or otherwise. The value of whatever the company owns and devotes to the public service regardless of the means or method of acquisition is a just and proper standard by which to measure reasonable rates. But it cannot, I think, be said looking at the matter broadly that the company is the owner either technically or equitably of the service pipes. It bought and put them in, it is true, but when it was reimbursed by its patrons for the cost, can it be supposed that it
77 still intended to retain title and the right to remove them at pleasure? A more reasonable inference is that in every case both parties to the transaction regarded the pipes when paid for as belonging to the owner of the tenement with the right on his part to use them if so inclined in connection with a service furnished by a rival company or for any other purpose, even though entirely unrelated to the gas business. They cannot, it seems to me, consistently with the principle above stated by Justice Harlan, constitute in part the basis for a rate that can be regarded as entirely fair to the public. The gas consumers have paid $30,484.00 of the amount claimed by the company for putting in service pipes, and this item I have eliminated from the valuation.

## Depreciation.

In computing depreciation, I have, so far as reliance has been placed upon arbitrary hypothesis, used what is known as the straight line method, as being most appropriate to the actual situation and condition with which we have to deal, and the one best calculated to bring about a right result. It has been said in Hayes on Public Utilities (Section 139):

"When the property of a public utility consists of plant alone, the loss in value must be determined by the str-ight line method, and when the property consists of plant and depreciation reserves, the loss in value must be ascertained by means of what has been called the sinking fund method."

And in Section 162, the author further says:

"If there is plant alone as representative of the property of the undertaking, the straight line method when age and life have been determined with accuracy, will show the absolute loss in value and consequently this loss in value gives the true depreciation of the property. If the property of the undertaking consists of plant and reserves, the sinking fund method will likewise show the loss in value if properly applied. But the equity of this method has been the subject of much doubt."

78 Foster, in his work entitled "Engineering Valuation of Public Utilities and Factories," says:

"By far the most commonly used method of depreciating machinery and plant is that known as the straight line. By this method a length of life of the particular apparatus under consideration is estimated and determined by the best experience and good judgment available, then this length of life divided into 100 will give the rate

at which the depreciation is to be computed. If the life of an engine is assumed to be twenty years, then its cost new will be depreciated one twentieth of such cost each year, or at the rate of five per cent per annum on the original cost new.

"While this method is in itself an assumption, yet it does away with all side assumptions or guesses as to how much the machine is depreciating each individual year. It is the method used by many public utility commissions, by the courts, most generally by public accountants, and by far the greater majority of engineers."

Here the property does consist of plant alone. There are no depreciation reserves invested in interest-bearing securities; there never have been. The company has, from year to year, put into the property so much of its earnings as seemed necessary to keep it in good order and operating efficiently. It has not adopted the practice to which the sinking fund method is thought to be peculiarly applicable. Indeed, it does not seem, upon the facts of this case, that any method of theoretical depreciation ought to be given controlling weight. Upon this question as well as all others relating to valuation, it should be remembered that arbitrary rules do not lead unerringly to the truth; they are only finger posts that indicate the general way. "It is not," as said in the Minnesota rate case (Simpson vs. Shepherd, 230 U. S. 352) "a matter of formulas, but there must be a reasonable judgment having its basis in a proper consideration of all the relevant facts." The life, age, present condition, fitness and scrap
79 value of the various protions of the plant as shown by the evidence should be taken into account, and given due consideration; and as far as practicable that is what has been done in this case. In the celebrated English case—The National Telephone Company, Limited, vs. His Majesty's Post Master General—decided last year, the court approved the straight line method, and with respect to the sinking fund method said:

"It may no doubt be right as applied to the case of an annuity or the valuation of a leasehold interest, but to apply a sinking fund to depreciate plant in a commercial undertaking involves too great an element of speculation and would operate, if a miscalculation were made as to the length of life, very unjustly in practice."

## Working Capital.

It is conceded by counsel for the City that items rightly included in this caption should be taken into account as part of the property upon which the company is entitled to a fair annual return. Mr. Adams' estimate of the total amount of such items is $20,000.00; Mr. Lea's is, in round numbers, $72,000.00, and the amount allowed by the court at the former trial was $50,000.00. Mr. Adams excludes from his estimate gas appliances kept for sale by the company with the view of thereby creating and stimulating a demand for gas. He also, while including supplies used in the manufacture of gas, excludes certain supplies used in its distribution on the ground that the latter are covered by the percentage already added to the net construction cost of the physical plant. Upon both these points, I think

Mr. Adams is wrong. The company was, in keeping and selling gas appliances, employing what seems to be a well recognized
80 and perfectly proper means of getting business. Increase of business is, or ought to be, beneficial to the public as well as to the company. It should, of course, result in reducing the cost of manufacture and distribution and eventually bring about a condition justifying a voluntary or compulsory reduction of rates. The fact that those appliances were perhaps handled at a loss is not at all decisive. In all lines of business, it is commonly regarded as sound policy to incur a present inconsiderable loss with the view of securing thereby a larger future gain.

With respect to the exclusion of distribution supplies, it is enough to say that such supplies cannot possibly be embraced in the percentage added to the physical plant until they have become actually incorporated therein. While they may be properly described as supplies, the money invested in them is unquestionably working capital. The evidence upon this branch of the case is far more complete than at the former trial, and relates to a different date, but it does not seem to require a very much larger allowance than was then made by the court. I fix the amount of such allowance at $60,000.00.

## Going Value.

The term "going value", as here used, is intended, while excluding franchise and good will, to include another intangible element which should, I think, be taken into account in the valuation of the property used by the company in the public service, and upon which it is entitled to claim a fair return. It is argued by counsel for
81 the City that whatever the rule may be in condemnation cases and other cases where utilities are taken over by public authorities under legislation providing therefor, there can, in the nature of things, be no allowance for going value in rate cases where value depends upon rates and rates upon value. This argument suggests a difficulty that is serious, but not insuperable. In Smyth vs. Ames, supra, and all the cases that have followed it, including Simpson vs Shepherd, supra, it is said that the public is entitled to be served at reasonable rates, and that the company rendering the service is entitled to a fair return on the value of the property used by it in the service. This statement has become, by judicial iteration, an axiom in the law of rate making, and the demand of the company to have applied in this case is not answered by pointing out difficulties besetting its application. Constitutional guarantees for the protection of private property are not to be set aside because precision and exactitude in making valuation are not practically attainable. The physical property, with all its parts articulated and ready to engage in the business for which it was created, is, of course, a valuable structure, but is obviously far more valuable when commercially quickened by the outflow of gas and the inflow of revenue. This added value, though hard to estimate, is obvious enough, and cannot, in justice and equity be disregarded for whatever purpose the valuation is made. It cost the company through the year a good deal of

money to get the consumers that it has; and even now, with the wide knowledge possessed by the public, of the convenience and economy of gas for light and fuel, it would require much time and expense for a new plant in exclusive possession of the field to build up
82 a like business. The expert witnesses who testified in this case are not in agreement as to the method by which going value should be ascertained. The essence of the process suggested by one of the witnesses is to consider the length of time it would take a person who wanted the business to acquire its equivalent, and then determine the price such person would be willing to pay. Another witness proposed, as a fair method, the assumed existence of two plants of equal efficiency, and like environment, one the actual plant of the company with its established business, the other a hypothetical plant without any business. He then, projecting both plants into the future, made an elaborate calculation as to the length of time and expense necessary to bring the business and earnings of the ideal plant up to those of the real plant. This method seems to me highly artificial, and is, at best, only moderately persuasive. Another suggestion was that the losses incurred by the company in the early years of its existence should be capitalized; and still another than an arbitrary amount should be allowed for each meter. The evidence does not, as I understand it, give any adequate basis for the ascertainment of going value by capitalization of losses, if that method were permissible under the doctrine of Knoxville Water Co. vs. Knoxville. 212 U. S. 1, where it is said:

"The company is not bound to see its property gradually waste without making provision out of earnings for its replacement. It is entitled to see that from earnings, the value of the property invested is kept unimpaired so that at the end of any given term of years, the original investment remains as it was at the beginning. It is not only the right of the company to make such provision, but it is its duty to its bond and stock holders, and in the case of a public service corporation at least its plain duty to the public * * * If, however, a company fails to perform this plain duty, and to exact sufficient returns to keep the investment unimpaired, whether this is the result of unwarranted dividends upon overissues of securities
83 or of omission to exact proper prices for the output, the fault is its own. When, therefore, the public regulation of its prices comes under question, the true value of the property then employed for the purpose of earning a return cannot be enhanced by a consideration of the errors in management which have been committed in the past."

Whether this element of plant value was purchased entirely by earnings below or above a fair return on capital invested is not, as to a portion of the time at least, disclosed by the company's records. In other words, it does not satisfactorily appear to just what extent the company's business was acquired at its own expense, and to what extent it was acquired at the expense of the public. The company was, at all times, entitled to a fair return upon its investment, and whatever was received by it in excess of a fair return should go, in some form, to the credit of the public. If employed in the promo-

tion of new business, the value of such business has manifestly no place in the valuation made as a basis for fixing reasonable rates. The record shows that between 1906 and 1913, the company paid out of its earnings and charged to operating expenses about One Hundred Thousand Dollars ($100,000.00) for the promotion of new business. In view of this fact, I conclude that an allowance of $40,000.00 for going value is sufficient.

Operating Expenses, 1912.

The total quantity of gas sold in Lincoln in 1912 is not in dispute. Neither is the amount of gross receipts. As shown by the company's records, there was sold in Lincoln alone 227,297, M. Cubic feet; and the revenue derived therefrom was $273,175.93. The total operating expenses on account of gas sold in Lincoln alone is shown by the company's records to be $173,689.87,
84 but according to the Company's records corrected by Mr. Lea—as to excessive residual credits, $2,722.23 and depreciation reserve $20,865.03—the total expenses not including occupation tax amounted $197,277.13. There is no question about the propriety of the correction made on account of residuals; and it is conceded that the records do not show that any amount was set apart to cover plant depreciation. Mr. Adams' estimate of the total operating expenses for Lincoln alone is $136,145.00. This makes a difference in net earnings between the amount fixed by Lea and the amount fixed by Adams of $61,132.12. The evidence shows quite clearly that the money claimed to have been paid out by the company for operating expenses was, in fact, so paid. The controversy then upon this branch of the case is reduced to two principal questions, namely:

(1.) To what extent, if at all, were the disbursements made by the company for operating expenses so recklessly or improvidently made that they ought not, in justice and fairness to the public be allowed and considered as legitimate factors in determining what constitutes a reasonable rate for gas in the City of Lincoln; and

(2.) What amount, in addition to the disbursements for the renewals and repairs shown in the record should be allowed as a depreciation reserve.

That there should be an additional allowance is admitted by Mr. Adams. The company's disbursements for salaries, office and general expenses are, according to the testimony of Adams,— based partly upon the records of gas plants in Massachusetts—$44,818.00 in excess of what they ought to be; but with one exception—
85 the cost of promoting new business, $19,692.00—he does not criticise any specific item. He proposes a reduction of the mass—a horizontal cut—rather than a reduction or elimination of particular items. There was, as above stated, sold in Lincoln in 1912, 227,297 M. cubic feet of gas, producing a gross revenue of $273,175.00. The operating expenses including $19,692.00 for promoting new business were, according to Lea, $197,277.00, and the net income $75,898.00. In 1911, the sales were 222,228 M.

cubic feet, the gross revenue $268,021.00, the operating expenses $180,232.00 and the net income $87,789.00. In 1910, the sales were 208,023 M. cubic feet, the gross revenue $248,957.00, the operating expenses $162,214.00, and the net income $88,742.00. In 1909, the sales were 203,243 M. cubic feet, the gross revenue $243,875.00, the operating expenses $152,167.00, and the net income $91,708.00. In 1908, the sales were 194,096 M. cubic feet, the gross revenue $232,792.00, the operating expenses $152,114.00, and the net income $80,678.00.

These figures without much scrutiny show the extent to which the validity of a rate ordinance depends upon individual will, if the right to determine what amount shall be expended in a campaign for new business or for any other purpose in a particular year is committed to the unrestrained discretion of the owner of the utility affected by the ordinance. That full discretionary power to transfer earnings into operating expenses cannot exist consistently with the right to regular rates seems self-evident. Reasonable expenditures to stimulate business are usual and proper, but an expenditure of between $19,000 and $20,000 in one year, which brings in, as increased revenue, less than $5,000.00 would seem to
86 be, under normal conditions, excessive, and when it may perhaps become a decisive factor in determining the constitutionality of rate legislation is, so extraordinary as to arrest attention and excite inquiry at once. The present litigation was pending; the demand for rate reduction was insistent; the controversy between the public and the company had become acute; the company was about to have its property inventoried and appraised for the purpose of showing that there was an unjust disproportion between its value and its net earnings. In this state of affairs unusual caution and conservative action was, it seems to me, the company's obvious and paramount duty; and yet I cannot discover, either in this particular expenditure or in any other evidence of a disposition on its part, by judicious retrenchment of expenses or wise economy of any kind to adjust itself to the conditions created by the ordinance reducing rates. It may be the company thought such adjustment was not possible, but whatever reason controlled its conduct, I cannot regard the expenditure for new business as having been reasonably or prudently made or one that ought, in its entirety, to be allowed or taken into account in testing the enforcibility of the ordinance for 1912. In the exercise of ordinary business prudence and giving due consideration to the rights and interests of the gas consuming public, I think the company should not have expended in its campaign for new business more than $12,000.00, and that is what I have, for the purposes of this litigation, decided to allow. Reasonable limitations upon expenditures must, in cases of this kind, be imposed by the courts or else the power to invalidate legislation regulating rates
87 will pass inevitably from the public authorities into the hands of the owners of public utilities. What is reasonable in a particular case is a judicial question upon which a court, however

lacking in business experience or technical knowledge, may not surrender its own judgment; it must, upon a full and fair consideration of all the relevant facts and circumstances, decided as best it can. My conclusion upon the point here considered is one in which I do not feel any high degree of confidence, but it is the one that seems, so far as it may exert an influence on the final decision, best calculated to bring about a just result.

Depreciation is, of course, an operating expense, and should be considered and dealt with as such. The annual deterioration of a plant by wear and tear represents always some fractional part of the money which it cost the owner to serve the public for a year. And this cost must be provided for out of earnings as well as the cost of current repairs. In order to keep a utility in good order and operating efficiently, the work of making repairs or renewals must be going on almost constantly. There is not always a clear division line between what constitutes renewals and what constitutes repairs. The distinction is largely theoretical; the line of division more or less arbitrary. Sometimes the question is determined by the size of the plant unit, sometimes by its cost, sometimes by the frequency with which it has to be replaced, and sometimes by other considerations. And it happens, too, where accounts are not accurately kept that the labor cost of making a renewal—an item often of considerable magnitude—is charged up to labor account. There seems to be in these matters no
88 uniformity of practice, and there is consequently in many cases no means of determining whether a particular plant item of doubtful classification—and even where there is no doubt—has been charged up in operating expenses wholly or in part as an item of repair or labor. Mr. Adams is of opinion that 9 cents per M. Cubic feet of gas sold is sufficient to take care of annual repairs, renewals and depreciation; and his estimate of what would be a *fiar* allowance for general depreciation and renewals is $10,914.26. There is, so far as I can see, no close or constant relation between plant depreciation and plant product, and any estimate based on the assumption that there is, would in my judgment be more or less arbitrary. My conclusion is that an allowance of $12,000.00 in addition to what appears upon the company's records as operating expenses ought to be made. It is a figure which I believe, after giving due consideration to the theories propounded by counsel and to actual conditions as well, gives a fairly good approximation of what is here required to cover wear and tear and keep plant value undiminished.

The executive salaries, in comparison with those paid by other utilities producing and selling about the same amount of gas, are apparently excessive. I cannot believe the total expenditures for this purpose would have been, under the circumstances disclosed by the record, considered reasonably necessary had the business been prudently conducted with a view to making the cost of gas to consumers as low as good service and fair return upon the capital invested would justify. The operation of a public utility is a busi-

ness within the scope of government. The company's plant
89 is affected by a public use; the company has, in a qualified sense, taken upon itself, a governmental function, and is, therefore, bound in the conduct of its business to scrupulously regard the rights of the public equally with its own. A majority of the stock of the Lincoln Gas & Electric Light Company is owned and controlled by Henry L. Doughtery & Company of New York, a co-partnership engaged in banking and manufacturing and controlling, through stock ownership, over one hundred utilities—gas, water, electric and transportation—which it operates in practically the same manner as it does the Lincoln plant. Frank Fruehauff became President of the Lincoln company in 1911 at a salary of $2,400.00 a year, and at the same time—at a time when an increase of operating expenses might be doubly advantageous to him—Henry L. Dougherty became President of the Board of Directors at a salary—newly created—of $3,000,00 a year. Prior to 1911, Mr. Daugherty was President of the company and Mr. Fruehauff, as Vice President, performed, without compensation, the same services for which he now receives $2,400.00. Mr. Fruehauff visits Lincoln six or eight times a year; Mr. Daugherty, so far as the record discloses, does not come at all. Mr. B. C. Adams, an exceptionally efficient and capable man having a thorough technical and general knowledge of the gas business, is local manager at a salary of $3,600.00 a year. Of the hundred and eight properties under the supervision of Henry L. Daugherty & Co., only three or four in addition to the Lincoln plant pay Mr. Fruehauff a salary. Whether Mr. Daugherty receives a salary from any of them does not appear. Conceding that the Lincoln company may receive prestige as well as financial, educational and other advantages from its con-
90 nection with Henry L. Daugherty & Co., I nevertheless think that the items of $3,000.00 for salary to the President of the Board of Directors should, for the purposes of this case, be disallowed.

Mr. C. A. Fruehauff, a brother of the President, engaged in the practice of law in New York City, receives from the Lincoln company an annual salary of $600.00, which is charged up as part of the operating expenses. I think this expenditure, on the evidence given with respect to it, ought not to be allowed or taken into account in the decision of this case. In view of the fact that the company has, in its employ at Lincoln, a lawyer—one of the most capable and eminent in the profession—at a salary of $3,000.00 a year, it can hardly be reckoned reasonably necessary or prudent and provident management to incur this extra legal expense, especially at a time when it was claimed that compensatory earnings, measured by the dollar rate, were not coming in.

## Apportionment of Operating Expenses.

In his division of operating expenses, Mr. Lea assumes that eighty per cent should be apportioned to the gas department and twenty per cent to the electric department. This assumption is, I think,

erroneous. The expenses common to both departments ought to be divided according to the relative number of customers in each department. This seems to be an entirely fair method of division and no other method has been suggested. In 1912, 73 per cent of all plaintiff's customers were in the gas department, and 27 per cent in the electric department. The division of expenses made on this basis requires a deduction of $3,300.00 from Mr.
91 Lea's estimate of the amount chargeable to the gas department.

## Revision.

Recasting now Mr. Lea's figures to conform to the views here expressed, and taking into account an item of $8,195.00 representing occupation tax not heretofore considered, I find the gross earnings for 1912 to be $273,175.93, the legitimate operating expenses $182,015.00 and the net income with gas at $1.20 per M. cubic feet, $91,161.00. With gas at $1.00 the gross earnings would be $227,297.00, the operating expenses including occupation tax $180,639.00, and the net income $46,658.00 or 6.9 per cent on $676,565.00, the total value of the company's property used or useful in the gas business in the City of Lincoln January 1, 1913. The items aggregating such value are:

| | |
|---|---|
| Real Estate | $16,250.00 |
| Buildings | 29,381.00 |
| Works Equipment | 179,310.00 |
| Distribution system | 351,624.00 |
| Working capital | 60,000.00 |
| Going value | 40,000.00 |

## Valuation, Operating Expenses and Net Income for 1907.

If the value of plaintiff's property, tangible and intangible, on January 1, 1913, was $676,565.00, as I have found it to be, its value January 1, 1907, may be readily ascertained by eliminating all values added to the plant between these dates. The construction account shows the original cost of all such additions to the
92 physical property to be $210,437.00. An estimate given by Mr. Lea increases this amount to $371,294.00; and by an addition of $108,664.00 for going value, working capital, organization and legal expenses, he further increases it to $479,958.00. According to Mr. Adams estimate, the tangible property was worth $135,830.00 less January 1, 1907, than on January 1, 1913. Just what the actual increase of structural cost was is not entirely clear, but from a full consideration of the evidence, I find that all values tangible and intangible added to the plant between January 1, 1907, and January 1, 1913, were worth, at the latter date $240,000.00. Deducting this amount from $676,565.00, the value of January 1, 1913, leaves $436,656.00 representing the investment

upon which the company was entitled on January 1, 1907, to receive a fair return.

There is no controversy with respect to the gross earnings for 1907. They were, according to both Lea and Adams, $214,888.20. The operating expenses as shown by the company's record were $141,621.49; and according to the company's records corrected by Lea $156,766.49. It appears from the company's records that there was charged to Repairs and Renewals $12,920.00; how much to each does not appear. Nothing was charged to depreciation under that specific designation. The correction made by Mr. Lea in the company's account of operating expenses consisted in adding thereto $14,955.00 for depreciation. That some amount should be added is undeniable, but I am of opinion that the amount added by Mr. Lea is too large. The property has been depreciated on the assumption—warranted I think by the proof—that it has been kept in good order and efficient, not only by current repairs, but by renewals as well. It would, therefore, be peculiarly unjust
93 to the public to determine wholly by theoretical depreciation the sum required to cover all dim-ution of plant value not taken care of as part of the regular operating expenses. I thing $10,000.00 is a sufficient allowance. Either it is enough or the property has not been sufficiently depreciated in fixing its present worth. Deducting from $156,766.49, the total operating expenses as determined by Lea, the sum of $4,955.00/ excess depreciation reserve, leaves $151,811.49 as the operating expenses for 1907 exclusive of the occupation tax of 2½ per cent; and including the occupation tax ($5,372.00) leave $157,183.00 as the total cost of conducting the business. This gives a net revenue of $57,705.00 with gas at $1.20. With gas at $1.00, the gross income would be $178,626.00, the operating expenses, including the occupation tax ($4,466.00) would be $156,277.00, and the net income $22,349.00 at [redacted] per cent on $436,565.00, the value of plaintiff's investment in 1907.

5.12

Net Earnings Between 1907 and 1912.

I do not go into the accounts for the years between 1907 and 1912 as the calculations made by Mr. Lea show beyond question that the net income was for each of these years from 50 per cent to 100 per cent greater than in 1907. In these intervening years, there are various expenditures growing out of the present litigation which should, if necessary to sustain the ordinance, be deducted from operating expenses. There are also many items of incidental expense that should be similarly dealt with. These later items are not large in the aggregate and there is small likelihood that they would affect the result in any possible revision of
94 these findings. I, therefore, do not consider them in detail.

It may not be out of place, however, to remark that in my judgment a utility corporation engaged as it is in carrying on a public business is bound to be prudent and circumspect in the use of its revenues. It seems hardly consistent with sound principles

for such a corporation to maintain a free-list or to make expenditures for social or fratneral purposes or even for the advancement of education, morality, charity or religion and then lay the burden of its munificence upon non-consenting rate payers. The practice of any cardinal virtue is, of course, wholesome and worthy of all commendation, but when indulged in by corporations, it ought in reason to be, as in the case of individuals, at their own cost.

### The Occupation Tax Ordinance.

The ground upon which it is thought the occupation tax ordinance is unconstitutional is that it discriminates against plaintiff by imposing upon it a burden from which competitors engaged in the business of furnishing light by electrical current in Lincoln are exempt. I think the ordinance is valid. There is an obvious and substantial difference between a company manufacturing and selling gas for light and fuel and one generating and selling electrical current for light only. A classification that includes one and excludes the other is not arbitrary, but rests upon a real and material distinction between the two. The objection to the ordinance would have equal force, it seems to me, if based on the exemption from its burdens of dealers in coal, wood, gasoline, coal oil or any other product used extensively as a fuel or illuminant.

95

### Valuation of Franchise.

The company's franchise is not taken into account as part of the property devoted to the public service upon which it is entitled to a reasonable return. Whether it be a perpetual or temporary franchise is not, in my opinion, material for the purposes of this case. However valuable a franchise may be, it cannot, under the authorities as I understand them, affect in any way the rate which a public service corporation may charge its customers.

### Dividends.

The company has never paid any dividends upon its stock. Its bonded debts far exceeds the value of its assets; and its income beyond operating expenses has been, from year to year, applied upon bond interest. In estimating the value of the entire property, the stock and bonds have received due consideration in accordance with the established rule, but I cannot say that they have been influential factors.

### Return upon Invested Capital in Lincoln.

A considerable number of witnesses testified with respect to the return upon capital invested in banking, merchandising and other businesses in the City of Lincoln, and from their testimony, I find that 8 per cent is the lowest rate sought and generally obtained in such businesses. There is, however, in all these lines free competi-

tion and hazards from which a utility corporation is exempt. Banks fail; merchants go to the wall, but if any honestly capitalized
96 and conducted gas, water or electric company having a monopoly of the business in the community which it serves has become bankrupt, the fact has escaped my notice. The profits of such corporation may not be large, but they are virtually guaranteed profits, and I cannot believe that a rate not lower than 6 per cent upon their invested capital could be regarded as confiscatory. There is evidence in the record indicating that plaintiff regards investments in the stock of these corporations as especially desirable.

Probable Future Earnings at Reduced Rate.

All human experience has shown that increased consumption follows quickly a reduction in the price of commodities, and the evidence in this case satisfactorily shows that gas is no exception to the rule. I find that with gas selling at $1.00 per M cubic feet, plaintiff would have received since December 1, 1907, when the rate ordinance was to be effective, not less than 6 per cent per annum upon the value of the property employed by it in serving the people of Lincoln.

Conclusion.

My conclusion is that the ordinance reducing the price of gas from $1.20 to $1.00 has been, at all times enforceable according to its terms, and that the injunction heretofore granted restraining its enforcement should be vacated and the bill dismissed.

Respectfully submitted,

JOHN J. SULLIVAN,
*Special Master.*

97 *Supplemental Report of Special Master.*

Filed in United States District Court, District of Nebraska, Lincoln Division, September 17, 1914.

To the Court:

The evidence taken by me in this case has been returned to the office of the Clerk of this court. It consists of the original printed record containing the evidence taken at the first trial, together with seven volumes of additional evidence taken at the second trial. These volumes are identified by the following certificate pasted in or upon each, to-wit:

"This is one of seven volumes of evidence taken before me at the trial of the case of Lincoln Gas and Electric Light Company vs. City of Lincoln, et al., pending in the United States District Court, for the District of Nebraska, Lincoln Division. These volumes, together with the original printed record containing the evidence given on the first trial and certified to the Supreme Court of the

United States, constitute the whole of the evidence submitted to me, and upon which my report heretofore filed in this case is based.

JOHN J. SULLIVAN,
*Special Master.*

Respectfully submitted,

JOHN J. SULLIVAN,
*Special Master.*

98 *Defendant's Exceptions to Report of Special Master.*

Filed in United States District Court, District of Nebraska, Lincoln Division, September 26, 1914.

And now comes the city of Lincoln, defendant in the above entitled cause and excepts to the Report of Hon. John J. Sullivan, Special Master, filed herein on the 8th day of September, 1914, and for cause of exception showes:

First. The Master has in said report found and certified that an allowance should be made of twelve and one-half (12½) per cent on the total net construction cost of the physical property (excepting real estate and working capital) as "overhead expense" and added to such construction costs in arriving at the reproduction cost of plaintiff's property, whereas the Master ought to have found that an allowance of seven per cent was sufficient and proper for such purpose.

Second. The Master has, in said Report, stated and certified that all of the real estate included in plaintiff's inventory and valued by the Company's gas expert, Henry D. Lea, is sufficiently used and useful to entitle the Company to a reasonable return thereon, whereas he should have found that lots One (1) to twelve (12), inclusive, in block Seventy-nine (79), in the City of Lincoln, whereon the Company's manufacturing plant is located, are the only real estate of the Company used and useful to the Lincoln service, and the only real property upon which plaintiff is entitled to a return.

Third. That the Master has, in said Report, stated and certified that the value of the plaintiff's real estate, used and useful in the Lincoln service is $16,250.00, whereas he should have found and reported that the value of the real estate of the Company,
99 used and useful in the Lincoln service is but $2,625.00.

Fourth. The Master has, in said Report, found and certified that the reproduction cost of complainant's buildings as of January 1, 1913, was $36,767, and their present value, as of said date, $29,381, whereas he should have found such reproduction cost to be $28,135, and the present value as of said date, $19,903.

Fifth. The Master has, in said Report, found and certified that reproduction of the Complainant's property classified in the Company's inventory, and designated in the record as "Works Equipment," is $198,868, and the paresent value as $179,310, whereas he should

have found and certified such reproduction cost to be $171,273, and should have found the present value to be $130,544.

Sixth. The Master has in said report found and certified that the reconstruction cost of the complainant's distribution system, as of January 1, 1913, was $396,216, and its present value $351,624, whereas he should have found the reproduction cost to be $347,190, and its present value $223,256.

Seventh. The Master has in said report found and certified that complainant should be allowed $60,000 for working capital and has included that sum in his valuation of *Complainant should be allowed $60,000, for working capital, and has included that sum in his valuation, of* complainant's property, whereas he should have found that $20,000, was a sufficient allowance and not more than that sum should have been included in the valuation to cover this item.

Eighth. The Master has, in said report, stated and certified that the intangible item denominated "Going Value" was one proper to be included as a part of plaintiff's property upon which
100 it is entitled to a return in this case, and fixed the amount to be allowed for said item of $40,000, whereas he should have found and reported that said item was not proper to be included at all in this case, and should have excluded it.

Ninth. The Master has, in said report, found and certified that the complainant should be allowed $12,000, in its operating expenses for 1912, to cover the cost of promoting new business whereas he should have allowed no sum for said item but should have excluded it.

Tenth. The Master has in said report, found and certified that the total value of Complainant's property in 1907 was $436,565, whereas he should have found such total value to be not to exceed $268,400.

Eleventh. The Master, has, in said report, found and certified that the total value of Complainant's property January 1st, 1913, to be $676,565, whereas he should have found it to be not to exceed $374,447.

Twelfth. The Master has found and certified in said report that $5,372 should be included in the Company's operating expense for 1907, on account of an occupation tax imposed on the Company by an Ordinance then in force, in the City of Lincoln, whereas this item should have been excluded since the Company has never paid said occupation tax, and is now contesting its validity in the Courts.

Thirteenth. The Master has, in said report, found and certified that plaintiff was entitled to include in its operating expenses of 1912, the sum of $8,195, to cover occupation taxes due from said plaintiff, to the City of Lincoln, whereas said item should have been excluded since said occupation tax was not paid but is now being contested by plaintiff in the Courts.

101 Fourteenth. The Master has, in said report, failed to require the plaintiff to charge to the suburban service, wherein it furnishes from its Lincoln plant, gas to the State Farm, University place and Havelock, all outside of the city limits, of the City of Lin-

coln, a reasonable sum as a capital charge for the use of the plant and property in the City of Lincoln, as compensation for the use of the Lincoln plant, and mains, in manufacturing the gas and conveying it to the city limits, and in furnishing suitable pressure for such outside service, and has not required the plaintiff to charge to such outside service, its reasonable share of the general operating expenses, whereas he should have required such outside service to bear its just proportion of the capital investment and of the general operating expenses.

Fifteenth. The Master has, in sa-d report, found and certified that the net return earned by the complainant with gas at $1.00 per thousand cubic feet, was for the year 1907 5.12 per cent and for the year 1912, 6.9 per cent, whereas he should have found the net return for 1907 to be seventeen per cent, and for the year 1912, 23.2 per cent.

WM. M. MORNING AND
FRED L. FOSTER,
*Attorneys for Defendants.*

102 *Plaintiff's Exception to the Report of the Special Master.*

Filed in the United States District Court, District of Nebraska, Lincoln Division, September 26, 1914.

Comes now the Lincoln Gas & Electric Light Company in the above entitled cause and excepts to the report of the Honorable John J. Sullivan, Special Master, filed in the court this 8th day of September 1914, and for cause of exception shows: First, that the Master in said report stated and certified that the value of real estate in controversy is the sum of $16,250.00, whereas the Master ought to have found, stated and certified the value of said real estate not less than $18,520.00.

2. That the Master in said report stated and certified that the value of the Purifying House in controversy is the sum of $13,200.00, whereas the Master ought to have found, stated and certified the value of said Purifying House not less than $14,074.00.

3. That the Master in said report stated and certified that the value of the Generator House in controversy is the sum of $3,800.00, whereas the Master ought to have found, stated and certified the value of said Generator House not less than $4,120.00.

4. That the Master in said report stated and certified that the value of the Retort House in controversy is the sum of $6,375.00, whereas the Master ought to have found, stated and certified the value of said Retort House not less than $6,511.00.

103 5. That the Master in said report stated and certified that the value of the Meter Shop and Booster House in controversy is the sum of $2,660.00, whereas the Master ought to have found, stated and certified the value of said Meter Shop and Booster House not less than $2,883.00.

6. That the Master in said report stated and certified that the value of the Dist. Holder Booster House in controversy is the sum of

$770.00, whereas the Master ought to have found, stated and certified the value of said Dist. Holder Booster House not less than $803.00.

7. That the Master in said report stated and certified the reproduction cost of works equipments in controversy is the sum of $198,868.00, whereas the Master ought to have found, stated and certified the reproduction cost of said Works equipments not less than $253,298.

8. That the Master in said report stated and certified that the value of the Works equipments in controversy is the sum of $179,310.00, whereas the Master ought to have found, stated and certified the value of said Works equipment not less than $196,759.

9. That the Master in said report stated and certified that the value of Item No. 1 of Works equipment is the sum of $8,030.00, whereas the Master ought to have found, stated and certified the value of said item No. 1 of Works equipment not less than $9,636.

10. That the Master in said report stated and certified that the value of item No. 2 of Works equipment is the sum of $7,710.00, whereas the Master ought to have found, stated and certified the value of said item No. 2 of Works equipment not less than $9,341.00.

104 11. That the Master in said report stated and certified that the value of item No. 3 of Works equipment is the sum of $1,215.00, whereas the Master ought to have found, stated and certified the value of said item No. 3 of Works equipment not less than $1,343.

12. That the Master in said report stated and certified that the value of item No. 4 of Works equipment is the sum of $1,810.00, whereas the Master ought to have found, stated and certified the value of said item No. 4 of Works equipment not less than $2,332.00.

13. That the Master in said report stated and certified that the value of item No. 5 of Works equipment is the sum of $5,850.00, whereas the Master ought to have found, stated and certified the value of said item No. 5 of Works equipment not less than $6,648.00.

14. That the Master in said report stated and certified that the value of item No. 6 of Works equipment is the sum of $1,625.00 whereas the Master ought to have found, stated and certified the value of said item No. 6 of Works Equipment not less than $2,200.

15. That the Master in said report stated and certified that the value of item No. 7 of Works equipment is the sum of $1,380.00, whereas the Master ought to have found, stated and certified the value of said item No. 7 of Works equipment not less than $1,584.

16. That the Master in said report stated and certified that the value of item No. 8 of Works equipment is the sum of $260.00, whereas the Master ought to have found, stated and certified the value of said item No. 8 of Works equipment not less than $275.

105 17. That the Master in said report stated and certified that the value of item No. 9 of Works equipment is the sum of $275.00, whereas the Master ought to have found, stated and certified the value of said item No. 9 of Works equipment not less than $288.

18. That the Master in said report stated and certified that the value of item No. 10 of Works equipment is the sum of $150.00,

whereas the Master ought to have found, stated and certified the value of said item No. 10 of Works equipment not less than $200.

19. That the Master in said report stated and certified that the value of item No. 11 of Works equipment is the sum of $1,330.00, whereas the Master ought to have found, stated and certified the value of said item No. 11 of Works equipment not less than $1,438.00.

20. That the Master in said report stated and certified that the value of item No. 18 of Works equipment is the sum of $353.00, whereas the Master ought to have found, stated and certified the value of said item No. 18 of Works equipment not less than $366.

21. That the Master in said report stated and certified that the value of item No. 19 of Works equipment is the sum of $430.00, whereas the Master ought to have found, stated and certified the value of said item No. 19 of Works equipment not less than $570.

22. That the Master in said report stated and certified that the value of item No. 22 of Works equipment is the sum of $14,950.00, whereas the Master ought to have found, stated and certified the value of said item No. 22 of Works equipment not less than $16,-280.00.

106 23. That the Master in said report stated and certified that the value of item No. 23 of Works equipment is the sum of $1,730.00, whereas the Master ought to have found, stated and certified the value of said item No. 23 of Works equipment not less than $2,349.

24. That the Master in said report stated and certified that the value of item No. 24 of Works equipment is the sum of $327.00, whereas the Master ought to have found, stated and certified the value of said item No. 24 of Works equipment not less than $336.

25. That the Master in said report stated and certified that the value of item No. 25 of Works equipment is the sum of $160.00, whereas the Master ought to have found, stated and certified the value of said item No. 25 of Works equipment not less than $181.

26. That the Master in said report stated and certified that the value of item No. 26 of Works equipment is the sum of $858.00, whereas the Master ought to have found, stated and certified the value of said item No. 25 of Works equipment not less than $935.

27. That the Master in said report stated and certified that the value of item No. 27 of Works equipment is the sum of $9,950.00, whereas the Master ought to have found, stated and certified the value of said item No. 27 of Works equipment not less than $11,235.

28. That the Master in said report stated and certified that the value of item No. 28 of Works equipment is the sum of $3,440.00, whereas the Master ought to have found, stated and certified the value of said item No. 28 of Works equipment not less than $3,756.

29. That the Master in said report stated and certified that the value of item No. 29 of Works equipment is the sum of

107 $400.00, whereas the Master ought to have found, stated and certified the value of said item No. 29 of Works equipment not less than $441.

30. That the Master in said report stated and certified that the value of item No. 30 of Works equipment is the sum of $45,925.00,

whereas the Master ought to have found, stated and certified the value of said item No. 30 of Works equipment not less than $47,451.

31. That the Master in said report stated and certified that the value of item No. 31 of Works equipment is the sum of $14,920.00, whereas the Master ought to have found, stated and certified the value of said item No. 31 of Works equipment not less than $16,026.

32. That the Master in said report stated and certified that the value of item No. 33 of Works equipment is the sum of $404.00, whereas the Master ought to have found, stated and certified the value of said item No. 33 of Works equipment not less than $721.00.

33. That the Master in said report stated and certified that the value of item No. 34 of Works equipment is the sum of $415.00, whereas the Master ought to have found, stated and certified the value of said item No. 34 of Works equipment not less than $443.

34. That the Master in said report stated and certified that the value of item No. 36 of Works equipment is the sum of $40.00, whereas the Master ought to have found, stated and certified the value of said item No. 36 of Works equipment not less than $47.

35. That the Master in said report stated and certified that the value of item No. 41 of Works equipment is the sum of $86.00, whereas the Master ought to have found, stated and certified
108 the value of said item No. 41 of Works equipment not less than $96.

36. That the Master in said report stated and certified that the value of item No. 44 of Works equipment is the sum of $960.00, whereas the Master ought to have found, stated and certified the value of said item No. 44 of Works equipment not less than $1,058.

37. That the Master in said report stated and certified that the value of item No. 46 of Works equipment is the sum of $160.00, whereas the Master ought to have found, stated and certified the value of said item No. 46 of Works equipment not less than $183.00.

38. That the Master in said report stated and certified that the value of item No. 47 of Works equipment is the sum of $78.00, whereas the Master ought to have found, stated and certified the value of said item No. 47 of Works equipment not less than $178.

39. That the Master in said report stated and certified that the value of item No. 48 of Works equipment is the sum of $32.00, whereas the Master ought to have found, stated and certified the value of said item No. 48 of Works and equipment not less than $37.

40. That the Master in said report stated and certified that the value of item No. 50 of Works equipment is the sum of $410.00, whereas the Master ought to have found, stated and certified the value of said item No. 50 of Works equipment not less than $775.

41. That the Master in said report stated and certified that the value of item No. 51 of Works equipment is the sum of $158.00, whereas the Master ought to have found, stated and certified the value of said item No. 51 of Works equipment not less than $183.

42. That the Master in said report stated and certified that the value of item No. 53 of Works equipment is the sum of
109 $390.00, whereas the Master ought to have found, stated and certified the value of said item No. 53 of Works equipment not less than $411.

43. That the Master in said report stated and certified that the value of item No. 54 of Works equipment is the sum of $1,575.00, whereas the Master ought to have found, stated and certified the value of said item No. 54 of Works equipment not less than $1,657.

44. That the Master in said report stated and certified that the value of item No. 55 of Works equipment is the sum of $1,620.00, whereas the Master ought to have found, stated and certified the value of said item No. 55 of Works equipment not less than $1,829.

45. That the Master in said report stated and certified that the value of item No. 56 of Works equipment is the sum of $790.00, whereas the Master ought to have found, stated and certified the value of said item No. 56 of Works equipment not less than $1,090.

46. That the Master in said report stated and certified that the value of item No. 57 of Works equipment is the sum of $193.00, whereas the Master ought to have found, stated and certified the value of said item No. 57 of Works and equipment not less than $198.

47. That the Master in said report stated and certified that the value of item No. 58 of Works equipment is the sum of $1,395.00, whereas the Master ought to have found, stated and certified the value of said item No. 58 of Works equipment not less than $1,503.

48. That the Master in said report stated and certified that the value of item No. 59 of Works equipment is the sum of $549.00, whereas the Master ought to have found, stated and certified the value of said item No. 59 of Works equipment not less than $638.

110 49. That the Master in said report stated and certified that the value of item No. 60 of Works equipment is the sum of $368.00, whereas the Master ought to have found, stated and certified the value of said item No. 60 of Works equipment not less than $406.

50. That the Master in said report stated and certified that the value of item No. 61 of Works equipment is the sum of $5,110.00, whereas the Master ought to have found, stated and certified the value of said item No. 61 of Works equipment not less than $6,342.

51. That the Master in said report stated and certified that the value of item No. 62 of Works equipment is the sum of $2,075.00, whereas the Master ought to have found, stated and certified the value of said item No. 62 of Works equipment not less than $2,188.

52. That the Master in said report stated and certified that the value of item No. 64 of Works equipment is the sum of $395.00, whereas the Master ought to have found, stated and certified the value of said item No. 64 of Works equipment not less than $509.

53. That the Master in said report stated and certified that the value of item No. 65 of Works equipment is the sum of $7,400.00, whereas the Master ought to have found, stated and certified the value of said item No. 65 of Works equipment not less than $8,985.

54. That the Master in said report stated and certified that the value of item No. 66 of Works equipment is the sum of $20,225.00, whereas the Master ought to have found, stated and certified the

value of said item No. 66 of Works equipment not less than $20,808.

111 55. That the Master in said report stated and certified that the value of item No. 67 of Works equipment is the sum of $175.00, whereas the Master ought to have found, stated and certified the value of said item No. 67 of Works equipment not less than $185.

56. That the Master in said report stated and certified that the value of item No. 68 of Works equipment is the sum of -475.00, whereas the Master ought to have found, stated and certified the value of said item No. 68 of Works equipment not less than $516.

57. That the Master in said report stated and certified that the value of item No. 69 of Works equipment is the sum of $1,650.00, whereas the Master ought to have found, stated and certified the value of said item No. 69 of Works equipment not less than $1,707.

58. That the Master in said report stated and certified that the value of item No. 70 of Works equipment is the sum of $420.00, whereas the Master ought to have found, stated and certified the value of said item No. 70 of Works equipment not less than $442.

59. That the Master in said report stated and certified that the value of item No. 71 of Works equipment is the sum of $155.00, whereas the Master ought to have found, stated and certified the value of said item No. 71 of Works equipment not less than $167.

60. That the Master in said report stated and certified that the value of item No. 72 of Works equipment is the sum of $183.00, whereas the Master ought to have found, stated and certified the value of said item No. 27 of Works equipment not less than $196.

112 61. That the Master in said report stated and certified that the value of item No. 73 of Works equipment is the sum of $206.00, whereas the Master ought to have found, stated and certified the value of said item No. 73 of Works equipment is not less than $229.

62. That the Master in said report stated and certified that the net construction cost of the mains in controversy, laid in unpaved streets is the sum of $173,700.00, whereas the Master ought to have found, stated and certified the net construction cost of said mains to be not less than $179,814.00.

63. That the Master in said report stated and certified that the net construction cost of the services is the sum of $76,116.00, whereas the Master ought to have found, stated and certified the value of said services is not less than $111,689.00.

64. That the Master in said report stated and certified that the net construction cost of the Service Boxes and Cocks is the sum of $9,000.00, whereas the Master ought to have found, stated and certified the net construction cost of the Service Boxes and Cocks is not less than $11,068.

65. That the Master in said report stated and certified that the net construction cost of Service Governors is the sum of $18,950.00, whereas the Master ought to have found, stated and certified the net construction cost of Service Governors is not less than $19,902.

66. That the Master in said report stated and certified that the net construction cost of Meters is the sum of $60,500.00, whereas the

Master ought to have found, stated and certified the net construction cost of Meters is not less than $63,444.

67. That the Master in said report stated and certified that
113 the net construction cost of Railway Crossings is the sum of $2,800.00, whereas the Master ought to have found, stated and certified the net construction cost of Railway Crossings is not less than $6,220.

68. That the Master in said report stated and certified that the net construction cost of Appliances loaned is the sum of $3,250.00, whereas the Master ought to have found, stated and *and* certified the net construction cost of Appliances Loaned is not less than $3,791.

69. That the Master in said report stated and certified that he made no allowance for reproduction cost of paving over mains and services, whereas the Master ought to have found, stated and certified and made an allowance for present value of paving over mains and services in the sum of not less than $142,291.00.

70. That the Master in said report stated and certified that the Net Construction Cost of the Distribution System is the sum of $352,192.00, whereas the Master ought to have found, stated and certified the Net Construction Cost of the Distribution System is not less than $529,736.00.

71. That the Master in said report stated and certified that the Reproduction Cost of the Distribution System is the sum of $396,-216.00, whereas the Master ought to have found, stated and certified the Reproduction Cost of the Distribution System is not less than $614,493.00.

72. That the Master in said report stated and certified that the Depreciated Value or Present Worth of Distribution System is the sum of $351,624.00, whereas the Master ought to have found, stated and certified the Depreciated Value or Present Worth of the Distribution System is not less than $513,829.00.

73. That the Master in said report stated and certified that
114 the Working Capital is the sum of $60,000.00, whereas the Master ought to have found, stated and certified the Working Capital is not less than $72,037.63.

74. That the Master in said report stated and certified that the Going Value is the sum of $140,000.00, whereas the Master ought to have found, stated and certified the Going Value is not less than $225,000.00.

75. That the Master in said report stated and certified that the record shows that between 1906 and 1913, the company paid out of its earnings and charged to operating expenses about $100,000.00 for the promotion of new business, whereas the Master ought to have found, stated and certified that the amounts so expended were not in excess of $94,879.27, as shown by the record.

76. That the Master in said report stated and certified that the company should not have expended for the promotion of new business in the year 1912 more than $12,000.00, whereas the Master ought to have stated, found and certified that the company as shown by the record did expend $19,692.00 and that said expenditure was fully justified and a proper charge to operating expenses.

77. That the Master in said report stated and certified that an allowance of $12,000.00 ought to be made for depreciation in addition to what appears on the company's records as operating expenses, whereas the Master ought to have found, stated and certified that such allowance ought to be made in a sum not less than $20,865.00.

78. That the Master in said report stated and certified that the salary of $3,000.00 paid to the President of the Board of Directors should be disallowed and deducted from the operating ex-
115 penses of the company, whereas the Master ought to have found, stated and certified that the amount of said salary charged to the operating expenses in controversy was $2,400.00 and that such salary was justified and reasonable as shown by the record and a proper charge to the operating expenses of the company.

79. That the Master in said report stated and certified that the salary of $600.00 paid to the company's legal representative in New York was not a necessary or prudent expenditure and ought not to be allowed, whereas the Master ought to have found, stated and certified that the amount of said salary charged to the operating expenses, in controversy, as shown by the record was in fact $480.00; that it was a necessary and reasonable expenditure and a proper charge against the operating expenses of the company.

80. That the Master in said report stated and certified that in 1912, 73% of all plaintiff's customers were in the gas department and 27% in the electric department, whereas the Master ought to have found, stated and certified that as shown by the record, 1902 to 1912 inclusive, the average of all customers was 79% in the gas department and 21% in the electric department.

81. That the Master in said report stated and certified that a division of common expenses for the year 1912 on the basis of 73% and 27%, requires a deduction from the operating expenses chargeable to the gas department of $3,300.00, whereas the Master ought to have found, stated and certified that such readjustment, if it ought to be made, would require a deduction of not more than $460.71.

82. That the Master in said report stated and certified that the legitimate operating expenses for the year 1912, taking into account $8,195.00 occupation tax, were $182,015.00, whereas the Master ought to have found and stated and certified that the legiti-
116 mate operating expenses, including the assumed occupation tax would in fact be $205,472.13, as shown by the record.

83. That the Master in said report stated and certified that the net income for 1912 with gas at $1.20 per M cubic feet to be $91,-161.00, whereas the Master ought to have found, stated and certified the net income, considering assumed occupation tax, to be $67,-703.80 as shown by the record.

84. That the Master in said report stated and certified that the expenses for 1912 with gas at $1.00 per M cubic feet, and including occupation tax, would have been $180,639.00, and the net income $46,658.00, whereas the Master ought to have found, stated and certified that with gas at $1.00 per thousand cubic feet and includ-

ing occupation tax as shown by the record, the operating expenses would have been $204,078.97 and the net income $23,637.56.

85. That the Master in said report stated and certified that the net income with gas at $1.00 per M cubic feet would be 6.9% on $676,565.00, whereas the Master ought to have found, stated and certified that the net income for the year 1912 would be 3.5% on $676,565.00 and only 2.17% on the actual value of the company's property used or useful in the gas business in the city of Lincoln, January 1, 1913.

86. That the Master in said report stated and certified the total value of the company's property used or useful in the gas business in the city of Lincoln, January 1, 1913, to be $676,565.00 whereas the Master ought to have found, stated and certified such value to be not less than $1,090,913.00, as shown by the record.

87. That the Master in said report stated and certified that the estimates of values given by Mr. Lea showed an increase of
117 value from 1907 to 1912 in the sum of $479,958.00, whereas the Master ought to have found, stated and certified that Mr. Lea's present value 1912 was $1,090,913.00, and for 1907, $784,-682.00 as shown by the record, and that the increase in present values between 1907 and 1912, as stated by Mr. Lea, is not more than $306,231.00.

88. That the Master in said report stated and certified that $10,-000.00 is a sufficient allowance for depreciation for the year 1907, whereas the Master ought to have found, stated and certified that $14,955.00 was the necessary and reasonable allowance to charge for depreciation as shown by the records.

89. That the Master in said report stated and certified that on the basis of gas at $1.20 the net revenue for 1907, including occupation tax $5,372.00 was, $57,705.00, whereas the Master ought to have found, stated and certified that the net income under those conditions stated would have been $52,749.71 as shown by the record.

90. That the Master in said report stated and certified that with gas at $1.00 for the year 1907, the net income would have been $22,349, whereas the Master ought to have found, stated and certified that under the conditions named the net income for the year 1907 would have been $18,129.24.

91. The Master in said report stated and certified that on his assumption of net income and on his erroneous assumption of value for the year 1907 the net income was 5.12% of the value of the plaintiff's investment in 1907, whereas the Master ought to have found, stated and certified that the net income for the year 1907 was in fact as shown by the records only 2.31% of the value of the plaintiff's investment in 1907.

92. That the Master in said report stated and certified that he does not go into the accounts for the years between 1907 and
118 1912, as the calculations stated by Mr. Lea show beyond question that the net income was for each of these years from 50% to 100% greater than in 1907, whereas the Master ought to have found, stated and certified that as shown by the records the net income for the years succeeding 1907 were only from 8.9 per

cent to 57.7% higher than in the year 1907 and that for the year 1913 the net income was only 8.9% higher than the net income for the year 1907, as shown by the records.

93. The Master in the said report stated and certified that in the intervening years between 1907 and 1912 there are various expenditures growing out of the present litigation and many items of incidental expenses which should, if necessary to sustain the ordinance, be deducted from operating expenses, whereas the Master ought to have found, stated and certified that no expenditures had been made by the company during these intervening years which were not fully justified and necessary and that all expenditures were proper operating charges against the operating expenses of the company.

94. That the Master in said report stated and certified that the occupation tax ordinance is valid, whereas the Master ought to have found, stated and certified that said ordinance if enforced would operate to confiscate the plaintiff's property, as shown by the records, and should therefore and for other reasons be declared invalid, and discrimnatory.

95. That the Master in said report stated and certified that the question of whether the franchise is perpetual or temporary is not material in this case and that the said franchise, however valuable it might be, could in no way affect the rate, which the public service corporations may charge its customers, whereas the Master ought to have found, stated and certified that the question did materially affect the case and the rate of return, as well as its value and the rates, which the corporation might charge, as shown by the record.

119 96. That the Master in said report stated and certified that the bonded debt of the company far exceeds the value of its assets, whereas the Master ought to have found, stated and certified that the value of the company's assets is much greater than its bonded indebtedness.

97. That the Master in said report stated and certified that the company is free from competition and hazards, which attend other lines of business in the city of Lincoln, whereas the Master ought to have found, stated and certified that the company has many hazards as clearly shown by the record and also much competition, which necessarily affects the rate of return to which it should be entitled, as shown by the records.

98. That the Master in said report stated and certified that if any honestly capitalized gas, water or electric companies, having a monopoly of the business in the community in which it serves, has become bankrupt, the fact has escaped his notice, whereas the Master ought to have found, stated and certified that many such companies have failed and become bankrupt and that they are not exempt from the hazards of ordinary business.

99. That the Master in said report stated and certified that the profits of such a corporation are virtually guaranteed profits, whereas the Master ought to have found, stated and certified that such corporations are not guaranteed against losses nor do they have a guarantee of any specific amount of profits or rate of return, but on the

contrary, where regulation is had, the only guarantee that is given to such corporations is that they shall not earn in excess of certain specific rates.

100. That the Master in said report states and certified that he cannot believe that a rate not lower than 6% upon their invested capital could be regarded as confiscatory, whereas the Master ought to have found, stated and certified that any rate under 8% was less than usually expected in business of this character in this locality, that any rate less than 8% is considered as being non-compensatory, and therefore to the extent that it is short of said 8% proper return, it is confiscatory.

101. That the Master in said report stated and certified that there is evidence in the record indicating that plaintiff regards investments in the stock of these corporations as especially desirable, whereas the Master should have found, stated and certified that the record shows that the plaintiff company on the contrary regards its investment in this locality as being an extremely hazardous one under the existing conditions and that its stock is considered of little value in the market.

102. That the Master in said report stated and certified that all human experience has shown that increased consumption follows quickly a reduction in the price of commodities, whereas the Master ought to have found, stated and certified, as shown by the record, that because of strenuous competition of electric and other companies the demand for gas is gradually decreasing and it has only been possible for the company to make increases in the sales of gas by the expenditure of extraordinary efforts in the establishment of a new business department at large expense during the last twelve years, and that notwithstanding these extraordinary efforts the company's output for the year 1913 shows an appreciable decrease, as compared to the year 1912.

103. That the Master in said report stated and certified that with gas selling at $1.00 per M cubic feet, the plaintiff would have received since December 1, 1907, not less than 6% per annum upon the value of the property employed by it in serving the people of Lincoln, whereas the Master ought to have found, stated and certified that with gas selling at $1.00 per M cubic feet and with the tax ordinance enforced, the company would have received on the value of its property employed in serving the people of Lincoln for the year 1907 only 2.31%; for the year 1908 only 4.44%; for the year 1909, only 4.96%; for the year 1910, only 3.95%; for the year 1911 only 3.51% for the year 1912, not more than 2.17%; and for the year 1913, not more than 1.04%.

104. That the Master failed to certify and find the reproduction cost of each of the 73 items of Works equipment.

105. That the Master failed to find and certify the assumed life and age of each of the 73 items of Works equipment.

106. That the Master failed to find and certify the amount of depreciation and the rate of depreciation on each of the 73 items of Works equipment.

107. That the Master failed to find and certify the present value of each group of items of the Distribution System.

108. That the Master failed to find and certify the age and assumed life of each group of items of the Distribution System.

109. That the Master failed to find and certify the amount and rate of depreciation for each group of items of the Distribution System.

110. That the Master failed to find and certify the operating expenses, revenues and net incomes for the year 1913.

111. That the Master failed to find and certify the reproduction cost and present value of the property of the company for 1913.

112. That the Master failed to find and certify the reproduction cost and present value of the property of the company for the years 1908, 1909, 1910 and 1911, each separately.

113. That the Master failed to find and certify the amount and rate of depreciation for each of the years 1908, 1909, 1910, 1911 and 1913.

114. That the Master failed to find and certify the amount of organization and legal expense and other costs preliminary to
122 construction shown in the evidence in the amount of $33,-000.00.

115. That the Master failed to find and certify the reproduction cost and present value of paving over mains and services.

116. That the Master failed to find and certify a summary of the evidence on the values of the company's property, its operating expenses, net income and rate of return.

117. That the Master failed to find and certify the incompetency of the testimony of A. D. Adams offered on behalf of the city on questions of value of the company's property and on operating expenses and results.

118. That the Master failed to find and certify as to the franchise rights of the company involved in the issues necessary to be determined in valuing the company's property and in determining the operating expenses of the company and in determining the amount of depreciation, and failed to find and certify that the company had a perpetual franchise.

119. That the Master in said report stated and certified that he had reached the conclusion that the ordinance in controversy has been at all times enforceable according to its terms and that the injunction heretofore granted restraining its enforcement should be vacated and complainant's bill dismissed, whereas the Master ought to have found, stated and certified that said ordinance was not enforceable and its enforcement would have denied to the company just compensation and would have resulted in confiscation of the property of the company if enforced for the year- 1907, 1908, 1909, 1910, 1911, 1912 and 1913, and for each of said years, and that the injunction heretofore granted restraining the enforcement of said ordinance should be continued in force and made permanent.

LINCOLN GAS & ELECTRIC LIGHT COMPANY,
By HALLECK F. ROSE AND
E. C. STRODE, *Its Attorneys.*

123 *Additional Exceptions to the Report of Special Master.*

Filed in United States District Court, District of Nebraska, Lincoln Division, September 28, 1914.

Comes now the Lincoln Gas & Electric Light Company complainant in the above entitled cause and excepts to the report of the Honorable John J. Sullivan, Special Master, filed in this court on the 8th day of September 1914, and for cause the exception shows:

1. That the Master failed to find and certify to the extent of the application of the revenue of the years 1907-8-9-10-11-12 and 13, each separately to reconstruction or replacement as distinguished from current repairs and operating expenses, and that the Master failed to find and certify the amount of past expenditure for reconstruction or replacement and past operating expenses including current repairs for each of the years 1907-8-9-10-11-12 and 13, and failed to find and certify how the gross receipts for the Company for 1907-1913, inclusive, for each of the said years have been expended, and failed to find and certify the amount to be set aside for the year 1913 and thereafter for depreciation, and failed to find and certify the character and probable life of the property of the company and the methods adopted in the past to preserve the properties, and failed to find and certify on questions of value operating expense, net returns, rate of return, depreciation and franchise rights of the company, being questions raised by the complainant, supported by proofs all of which the Master was directed by the Supreme Court of the United States to fully report upon by order of the said court in the case.

124 2. The Master failed to find and certify the construction cost to the company of the property involved; and that the Master failed to find and certify the investment cost to the company of the property involved, and failed to find and certify the market value of the bonds of the company outstanding and obligations of the company issued and outstanding under the directions orders and authority of the Nebraska State Railway Commission and the rate of interest on such obligations.

3. The complainant excepts to the language employed by the Master in reference to the alleged Stone report being unsupported by any evidence, and unwarranted by any deductions to be drawn therefrom.

4. The complainant excepts to the conclusions of the master that deductions should be made from the value of the services in the distribution system, on account of advancement made by consumers, and excepts to the failure of the master to find and certify the Reproduction cost and present value of the paving over mains and services for each of the years 1907 and 1913 inclusive.

5. That the master failed to find and certify as to the competency, materiality and relevancy of the testimony offered as to the Massachusetts and other companies offered on behalf of the City of Lincoln and objected to on behalf of the complainant and failed to indi-

cate whether such testimony bearing on the results of such companies was taken into account and given consideration on part of the master in reaching the conclusions submitted; and failed to find and certify whether the increased cost and amount thereof in the manufacture of gas by complainant, on account of the pressure ordinance
125 and quality ordinance was taken into account and given consideration on the part of the Master in reaching conclusions submitted.

6. Complainant excepts to the conclusions submitted without a summary of the evidence being submitted therewith, and excepts to the final conclusions submitted by the master, in view of the finding of the master to the effect that "A summarization of this evidence is quite impossible and would so far as I can see aid neither court nor counsel in testing the correctness of the conclusion I have reached." and as a result thereof the complainant is denied the benefit of the testimony offered and means of testing the correctness of the master's conclusions by the evidence considered by the master.

THE LINCOLN GAS & ELECTRIC LIGHT CO.,
By HALLECK F. ROSE,
E. C. STRODE,
*Its Attorneys.*

126 *Motion of Plaintiff to Recommit the Case to the Special Master for Additional Findings.*

Filed in United States District Court, District of Nebraska, Lincoln Division, October 8, 1914.

Comes now the Lincoln Gas & Electric Light Company in the above cause and moves the Court to require and direct the Special Master herein to make, report and certify additional findings on each of the matters hereinafter specified, all of which are fully covered by the proofs and involved in the determination of the issues, and are necessary for a review of the findings and conclusions of the Master reported and filed herein, and for a full and fair consideration of the findings under the proofs presented; and moves the Court to recommit or refer the case back to the Special Master for such additional findings. This motion is presented for each request separately for additional findings:

1. That the Master be required and directed to find and certify the facts, disclosed by the evidence and his conclusions thereon, with respect to the franchise rights of the company, a material issue in the case.

2. That the Master be required and directed to find and certify a summary of the evidence on the values of the company's property, the operating expenses, the net income and the rate for each of the years, 1907-1913, inclusive, necessary for the court in reviewing and considering the findings of the Special Master and his conclusions thereon as reported herein.

3. That the Master be required and directed to find and certify the basis of valuation employed in determining the value of the Company's property, whether reproduction cost, original or in-
127 vestment cost, commercial or market value and upon what basis of value the several items of property had been valued by the Special Master in his findings and conclusions herein.

4. That the Special Master be directed and required to find and certify the reproduction cost and present value of the mains, including the paving over the same, as of January 1, 1907 and as of January 1, 1913.

5. That the Special Master be directed and required to find and certify the reproduction cost and the present value of the services, including the paving over the same, as of January 1, 1907, and as of January 1, 1913, and for each of the years intervening.

6. That the Master be directed and required to find and certify the present value of the house services, paid for in part by consumers, referred to in the Special Master's report, as fully shown in the evidence, as of January 1, 1907, and as of January 1, 1913, and for each of the years intervening.

7. That the Master be directed and required to find and certify the amount of organization and legal expense preliminary to construction, as fully shown in the evidence.

8. That the Master be directed and required to find and certify the amount and rate of depreciation for each of the years, 1907, 1908, 1909, 1910, 1911, 1912, and 1913.

9. That the Master be directed and required to find and certify the reproduction cost and present value of the property of the company involved herein for each of the years, 1908, 1909, 1910, 1911 and 1913.

10. That the Master be directed and required to find and certify the operating expenses, revenue and net income of the company from its gas department for the year 1913.

128 11. That the Master be directed and required to find and certify the amount and rate of depreciation for each group of items of property in the Distribution System of the Company involved herein, for each of the years, 1907-1913, inclusive.

12. That the Master be directed and required to find and certify the age and assumed life of each group of property of the company involved herein in the Distribution System for each of the years 1907-1913, inclusive.

13. That the Master be directed and required to find and certify the present value of each group of items of the company's property involved herein the Distributive System, for the year 1907, and for each of the years 1908, 1909, 1910, 1911, 1912 and 1913.

14. That the Master be directed and required to find and certify the amount of depreciation and rate of depreciation on each of the seventy-three items of works equipment referred to in the report of the Master herein for the year 1907, and for each of the years 1907, 1908, 1909, 1910, 1911, 1912 and 1913.

15. That the Master be directed and required to find and certify

the assumed age and life of each of the seventy-three items of works equipment in said report.

16. That the Master be directed and required to find and certify the reproduction cost of each of the seventy-three items of works equipment referred to in said report.

17. That the Master be directed and required to find and certify the extent of the application of the revenue for the year 1907, and for each of the years 1907, 1908, 1909, 1910, 1911, 1912 and 1913, and for each separately, for reconstruction or replacement, as distinguished from current reports and operating expenses; that the Master be required to find and certify the amount of past ex-
129 penditures and operating expenses and for past reconstruction and past replacement for each of the years 1907, 1908, 1909, 1910, 1911, 1912, and 1913; and how the gross receipts of the company for the years 1907-1913, inclusive, and for each of said years were expended; and the amount to be set aside for the year 1913 and thereafter for depreciation; and the character and probable life of the property of the company and the methods adopted in the past to preserve the property, as directed and required under the opinion and mandate in the Supreme Court of the United States in this case.

18. That the Master be directed and required to find and certify the original cost and investment cost of the property involved herein and the rate and amount of depreciation to be deducted therefrom in determining the present value for the year 1907 and each of the years 1908, 1909, 1910, 1911, 1912, and 1913, and the market value of the bonds of the company outstanding and rate of interest on such obligations should be under the direction and orders of the Nebraska Railway Commission.

19. That the Master be directed and required to find and certify the basis of valuation for each of the buildings employed by the Master, and a summary of the evidence submitted on the valuation of such buildings.

20. That the Master be directed and required to find and certify the basis of valuation for the works equipment employed by the Master, and a summary of the evidence upon the value of such works equipment submitted.

21. That the Master be directed and required to find and certify the basis of valuation for the distribution system employed by the Master and a summary of the evidence on the valuation of such distribution system submitted.

130 22. That the Master be directed and required to find and certify the basis of valuation for going value employed by the Master and a summary of the evidence of the valuation of such going value submitted.

23. That the Master be directed and required to find and certify a summary of the evidence on overhead charges and the basis employed by the Master in determining the amount to be allowed thereof.

24. That the Master be directed and required to find and certify a summary of the evidence on the item of executive salaries, re-

ferred to in the report of the Master herein, and the basis of valuation employed by the Master in determining the amount thereof.

25. That the Master be directed and required to find and certify the specific amount of any further additional items, if any, in the opinion and judgment of the Master, which should be excluded from the operating expenses of the company for the year 1907, and for each of the years 1908, 1909, 1910, 1911, 1912, and 1913, referred to in the Master's report herein.

26. That the Master be directed and required to find and certify as to the competency of the testimony of Alton D. Adams offered on behalf of the City on the value of the company's property and on the operating expenses and operating results of the company and on certain operating expenses and operating results of certain Massachusetts and other gas companies.

LINCOLN GAS & ELECTRIC LIGHT CO.,
By HALLECK F. ROSE,
E. C. STRODE,
*Its Att'ys.*

131 *Order of the Court upon Plaintiff's Application to Recommit the Report of the Special Master.*

Filed in United States District Court, District of Nebraska, Lincoln Division, December 10, 1914.

This cause having been heard upon the motion of the complainant to re-commit the report of the special master herein, to the special master for further findings of fact, and submitted to the court on the 7th day of November 1914, it is

Considered, and Adjudged that said motion be overruled, and it is Ordered that said motion be and it is hereby overruled.

PAGE MORRIS, *Judge.*

Clerk:

Enter this order.

PAGE MORRIS, *Judge.*

*Memorandum.*

I do not think the report of the Special Master should be recommitted now. It may be that the case will have to be sent back for further investigation and findings. But, after the Court has considered the present report, and the exceptions thereto, I think it will be very much the better able to say whether any, and if so what, additional investigation and findings are necessary.

MORRIS, *Judge.*

132 *Application of Plaintiff for an Order Permitting Taking of Further Testimony.*

Filed in United States District Court, District of Nebraska, Lincoln Division, June 14, 1915.

The Lincoln Gas & Electric Light Company moves the court for an order authorizing and permitting the taking of further testimony in the above entitled case with respect to the services of Sloan, Huddel etc., Company, the scope of the employment and services rendered, and report, if any, submitted by said Sloan, Huddle etc., Company of Madison, Wisconsin, referred to in the Special Master's report herein, and submit in support of this motion and application copy of letter written by Halleck F. Rose under date of August 7, 1914, to Mr. Huddle of the above named firm and the answer thereto from Mr. Huddle of the above firm; the testimony in view of the Master's finding is material and could not have been anticipated by complainant from the state of the record.

LINCOLN GAS & ELECTRIC
LIGHT COMPANY,
By E. C. STRODE,
HALLECK F. ROSE,
*Its Attorneys.*

Copy.

August 7, 1914.

Mr. Huddle, c/o Engineering Department Wisconsin Railway Commission, Madison, Wis.

DEAR SIR: You will recall that I met you at Lincoln in the Gas Company's office in connection with the Lincoln Gas & Elec-
133 tric Light Company's preparation for its gas rate suit. In considering with you propriety of calling you as a witness in this rate suit, the question arose as to the embarrassment and disadvantage to which you would be subjected as an expert witness in handling such matters as the cost of developing business, or "going value," overhead allowances, annual depreciation apart from general repairs, and maintenance and the like, upon which the Wisconsin Commission, in whose service you are, had made numerous rulings. You were frank to say that in these matters it would be quite embarrassing to yourself and possibly to the commission which you served, to express an independent judgment in an important court proceeding that should be variant from the conclusions reached by your commission. In these circumstances we concluded that the proprieties were against calling you at all, although your inventory valuations of the physical properties of the company were understood to be not only just and fair, but altogether satisfactory to the Lincoln Company. The Company called Mr. H. I. Lea as a witness on value and has submitted its case. I have never had access to any report of detailed valuations of the company's physical properties

made by you, and in the trial no consideration was given to your valuations because they were not qualified by your personal testimony.

At the argument it was insinuated by the City's attorney that your valuations, in so far as you made any, were unfavorable to the position of the Company and favorable to the City, and the fact that the Company failed to produce any report from you, should count against it. As Counsel for the Lincoln Company, I would greatly appreciate it if — your data acquired in your Lincoln examination you will state to me, in a letter, the aggregate sum which you found to be the reproductive value of the Lincoln Gas & Electric Light Company's physical properties in use in its gas department, and also what you found to be the present depreciated value of the same properties, stating at the same time that these valuations excluded any allowance for "going value" or cost of a perpetual franchise.

134

It is my impression that there was no radical difference between you and Mr. Lea on the valuations of the Company's physical properties, and if we conclude it is proper to do so, we would like leave to hand your letter in reply to this, to the Special Master, in order to prevent any suspicion on his part that your failure to testify in the case was due to law valuation of the Company's properties, as insinuated, without foundation, by the City's attorney.

I should appreciate your prompt reply very greatly.

Very respectfully,

(Signed) HALLECK F. ROSE.

MADISON, August 14, 1914.

Messrs. Stout, Rose & Wells, 524 National Bank Building, Omaha, Nebraska.

GENTLEMEN: In accordance with your request we hand you herewith figures showing the cost new and cost less depreciation which we found for the value of the gas property of the Lincoln Gas & Electric Light Company in our appraisal of January 1913.

135

| | Cost new. | Depreciated value. |
|---|---|---|
| 1. Land | 14,360 | 14,360 |
| 2. Buildings | 32,856 | 25,164 |
| 3. Plant Equipment | 90,239 | 69,779 |
| 4. Holders | 91,578 | 78,678 |
| 5. Mains | 191,648 | 165,559 |
| 6. Services | 56,224 | 39,919 |
| 7. Meters & Governors | 79,757 | 69,616 |
| 8. General Equipment | 14,858 | 12,668 |
| Total, Items 1-8 | 571,520 | 475,743 |
| 9. Engineering, Superintendence interest during construction, etc. 15% | 85,728 | 71,361 |
| Total, Items 1-9 | 657,248 | 547,104 |
| 10. Working Capital Material & Supplies | 17,645 | 16,873 |
| Other than material & supplies | 37,354 | 37,354 |
| Total, Items 1-10 | 712,248 | 601,331 |
| 11. Repaving | 159,851 | 129,171 |
| Total, Items 1-11 | 872,099 | 730,502 |
| 12. Land held but not used | 4,100 | 3,980 |
| Grand Total | $876,199 | $734,482 |

You will note that the figures above include no allowance for going value, goodwill or franchise value.

Trusting that this is the information you desire, we are,

Very truly yours,

SLOAN, HUDDLE, FEUSTEL & FREEMAN,

(Signed) Per W. F. HUDDLE.

136 *Decree.*

Filed in United States District Court, District of Nebraska, Lincoln Division, September 23, 1915.

This cause came on to be heard on the 16th day of June 1915, upon the report of Hon. John J. Sullivan, Special Master, filed herein on the 8th day of September, 1914, and the exceptions of the respective

parties to said report, and was argued by Counsel, and taken under advisement by the Court.

And now, upon consideration thereof, it is ordered, adjudged and decreed as follows, viz:

That the report of said Special Master be, and the same is, hereby confirmed;

That the Bill of Complaint herein, so far as the same relates to the ordinance of the City of Lincoln establishing a rate of charges for gas in said city be, and the same is, hereby dismissed, and the Restraining order heretofore granted against the enforcement of said ordinance is hereby dissolved:

That the sum of Thirty-five hundred dollars ($3,500.00) be, and the same is, hereby fixed and allowed as the compensation of said Special Master for his services and expenses, to be taxed as part of the cost of this action;

That the Plaintiff pay the costs of this action.

By the Court,

PAGE MORRIS, *Judge.*

(See memorandum next page.)

*Memorandum.*

I do not agree with the Special Master as to the constitutionality of the occupation tax ordinance of the City of Lincoln. On
137 that question I concur in the opinion of Judge Munger. But, inasmuch as the result reached by the Special Master would only be strengthened by a finding and decree of the Court adjudging said ordinance unconstitutional, I have not thought it necessary to pass upon it in this decree. If I agreed with the Special Master on that question I should still confirm his report.

I do not think it necessary to review the Special Master's report in detail, as the report speaks for itself.

PAGE MORRIS, *Judge.*

138 *Order to Transfer Papers to United States District Court, District of Nebraska.*

Filed in United States District Court, District of Nebraska, Lincoln Division, November 22, 1915.

An appeal in the above entitled action having this day been allowed and an appeal bond having been approved by me, one of the judges of the District Court of the United States for the District of Minnesota, sitting in this case by special appointment at Minneapolis, Minnesota, within said District.

It is hereby ordered that the papers on appeal including said bond be forwerded by the deputy clerk of the District Court of the United States for the District of Minnesota at Minneapolis, to the clerk of the District Court of the United States for the District of Nebraska, Lin-

coln Division, and to be endorsed by said last mentioned clerk as filed, as of this day, to-wit: November 22nd, 1915.

Dated November 22d, 1915.

PAGE MORRIS, *Judge.*

139 *Assignments of Error.*

Filed in United States District Court, District of Nebraska, Lincoln Division, November 22, 1915.

Now comes the plaintiff in the above entitled cause and files the following assignment of errors, upon which it will rely upon its prosecution of the appeal in the above entitled cause from the decree made by this Honorable Court on the 23rd day of September, 1915.

I.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in dismissing plaintiff's complaint in so far as it relates to the ordinance of the city of Lincoln establishing a rate of charges for gas in said city.

II.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in dissolving the restraining order theretofore granted by said court against the enforcement of the ordinance of the City of Lincoln, establishing a rate for charges for gas in such city.

III.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in approving the special master's report and overruling the plaintiff's exceptions thereto.

IV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and decreeing that the ordinance set out in plaintiff's bill, establishing the rate to be charged for gas in the city of Lincoln would be a violation of Article V of Amendments to the Constitution of the United States, in that
140 by the enforcement of said ordinance, the plaintiff would be deprived of its property without due process of law.

V.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and decreeing that the ordinance set out in the complaint establishing the rate to be

charged for gas in the City of Lincoln, to be a violation of Article V of the Amendments to the Constitution of the United States, in that by the enforcement of said ordinance, the private property of the plaintiff would be taken for public use without just compensation.

VI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and decreeing that the ordinance set out in plaintiff's bill establishing the rate to be charged for gas in the city of Lincoln, would be a violation of Section 1 of Article XIV of Amendments to the Constitution of the United States, in that by its enforcement the plaintiff would be denied the equal protection of the laws.

VII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and decring that the ordinance set out in the complaint establishing the rate to be charged for gas in the city of Lincoln to be a violation of section 1 of Article XIV of the Amendments to the Constitution of the United States in that by the enforcement of said ordinance, the plaintiff would be denied the equal protection of the laws.

VII A.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and de-
141 creasing the present value of plaintiff's property, used and useful in the manufacture and sale of gas in the city of Lincoln as of January 1, 1907 to be $784,682.00.

VII B.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the present value of the property of the plaintiff, used and useful in the manufacture and sale of gas in the city of Lincoln as of January 1, 1913, to be $1,090,913.00.

VIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in excluding the cost of reopening and replacing pavements over gas mains and services on paved streets as a necessary part of the reproduction cost of the property.

IX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in refusing to find and determine

that the plaintiff was entitled to a fair return from the actual investment, not improvidently made in the property, or to a fair return upon the reproduction cost new, less depreciation, and the court was not warranted in adopting the reproduction cost, less depreciation, in those instances only where it would secure a lower valuation than the investment cost, and use the investment cost as a basis of present value in those instances only where it could secure a lower valuation than the reproduction cost new, less depreciation.

X.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling the plaintiff's
142 exception number 7 to the report of the special master as follows:

"That the Master in said report stated and certified that the reproduction cost of Works Equipment in controversy is the sum of $198,868.00, whereas the Master ought to have found stated and certified the reproduction cost of said Works Equipment to be not less than $253,298.00."

XI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the reproduction cost of works equipment of the plaintiff, used and useful, in the manufacture and sale of gas in the city of Lincoln, as of January 1, 1913, to be the sum of $253,298.00.

XII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 8 to the master's report as follows:

"That the Master in said report stated and certified that the value of the Works Equipment in controversy is the sum of $179,310.00, whereas the Master ought to have found, stated and certified the value of said Works Equipment not less than $196,759.00."

XIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and decreeing the present value of Works Equipment of plaintiff used and useful in the manufacture and sale of gas in the city of Lincoln, as of January 1, 1913, to be $196,759.00.

XIV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception Number 62 as to the master's report as follows:

"That the Master in said report stated and certified that
143 the net construction cost of the mains in controversy, laid in unpaved streets, is the sum of $173,700, whereas the Master ought to have found, stated and certified the net construction cost of said mains to be not less than $179,814.00."

XV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the net construction cost of mains laid in unpaved streets in the city of Lincoln to be as of January 1, 1913, $179,814.00.

XVI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception Number 63 to the Master's report as follows:

"That the Master in said report stated and certified that the net construction cost of the service is the sum of $76,116.00, whereas the Master ought to have found, stated and certified the value of said services is not less than $111,689.00."

XVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the value of services used and useful, and a part of the distribution system of the plaintiff in the city of Lincoln as of January 1, 1913, to be the sum of $111,689.00.

XVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's
144 exception number 69 to the master's report, as follows:

"That the Master in said report stated and certified that he made no allowance for reproduction cost of paving over Mains and Services, whereas the Master ought to have found, stated and certified and made an allowance for present value of Paving Over Mains and Services in the sum of not less than $142,291.00."

XIX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the present value of plaintiff's property on the basis of the reproduction cost new, less depreciation, and including therein as a part thereof, the additional cost incident to and necessarily incurred in the reopening of paved streets for the purpose of laying gas mains therein.

XX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 70 to the master's report, as follows:

"That the Master in said report stated and certified that the Net Construction Cost of the Distribution System is the sum of $352,-192.00, whereas the Master ought to have found, stated and certified the Net Construction Cost of the Distribution System is not less than $529,736.00."

XXI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the net construction cost of the distribution system of the plaintiff as of January 1, 1913, to be $529,736.00.

145

XXII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 71 to the master's report as follows:

"That the Master in said report stated and certified that the Reproduction Cost of the Distribution System is the sum of $396,216.00, whereas the Master ought to have found, stated and certified the Reproduction Cost of the Distribution System is not less than $614,-493.00."

XXIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the reproduction cost of the distribution system to be as of January 1, 1913, the sum of $614,493.00.

XXIV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 72 to the master's report as follows:

"That the Master in said report stated and certified that the Depreciated Value or Present Worth of the Distribution System is the sum of $351,624.00, whereas the Master ought to have found, stated and certified that the Depreciated Value or present Worth of the Distribution System is not less than $513,829.00."

XXV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the present value of the distribution system of the plaintiff to be as of January 1, 1913, the sum of $513,829.00.

146

XXVI.

That the District court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 74 to the Master's report as follows:

"That the Master in said report stated and certified that the Going Value is the sum of $140,000.00, whereas the Master ought to have found, stated and certified the Going Value is not less than $225,000.00."

XXVII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining the going value of the property of the plaintiff as of January 1, 1913, to be the sum of $225,000.00.

XXVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 76 to the Master's report as follows:

"That the Master in said report stated and certified that the company should not have expended for the promotion of new business in the year 1912 more than $12,000.00, whereas the Master ought to have found, stated and certified that the company, as shown by the record, did expend $19,692.00, and that said expenditure was fully justified and a proper charge to operating expenses."

XXIX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 77 to the master's report, as follows:

"That the Master in said report stated and certified that an allowance of $12,000.00 ought to be made for depreciation in
147 addition to what appears on the company's records as operating expenses, whereas the Master ought to have found, stated and certified that such allowance ought to be made in a sum not less than $20,865.00."

XXX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 78 to the master's report, as follows:

"That the Master in said report stated and certified that the salary of $3,000.00 paid to the President of the Board of Directors should be dissolved and deducted from the operating expenses of the company, whereas the Master ought to have found, stated and certified that the amount of said salary charged to the operating expenses in controversy was $2,400.00 and that such salary was justified and

reasonable as shown by the record and a proper charge to the operating expenses of the company."

## XXXI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 79 to the Master's report, as follows:

"That the Master in said report stated and certified that the salary of $600.00 paid to the company's legal representative in New York was not a necessary or prudent expenditure and ought not to be allowed, whereas the Master ought to have found, stated and certified that the amount of said salary charged to the operating expenses, in controversy, as shown by the record, was in fact $480.00;

148 that it was a necessary and reasonable expenditure and a proper charge against the operating expenses of the company.

## XXXII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 80 to the master's report as follows:

"That the Master in said report stated and certified that in 1912, 73% of all plaintiff's customers were in the gas department and 27% in the electric department, whereas the Master ought to have found, stated and certified that as shown by the record, 1902 to 1912, inclusive, the average of all customers was 79% in the gas department and 21% in the electric department."

## XXXIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 81 to the master's report, as follows:

"That the Master in said report stated and certified that a division of common expenses for the year 1912 on the basis of 73% and 27%, requires a deduction from the operating expenses chargeable to the gas department of $3,300.00, whereas the Master ought to have found, stated and certified that such readjustment, if it ought to be made, would require a deduction of not more than $460.71."

## XXXIV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 82 to the master's report, as follows:

149 "That the Master in said report stated and certified that the legitimate operating expenses for the year 1912, taking into account $8,195.00 occupation tax, were $182,015.00, whereas the Master ought to have found, stated and certified that the legitimate operating expenses, including the assumed occupation tax, would in fact be $205,472.13, as shown by the record."

## XXXV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception 83, to the Master's report, as follows:

"That the Master in said report stated and certified that the net income for 1912 with gas at $1.20 per M cubic feet to be $91,161.00, whereas the Master ought to have found, stated and certified the net income, considering assumed occupation tax, to be $67,703.80, as shown by the record."

## XXXVI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 84 to the Master's report, as follows:

"That the Master in said report stated and certified that the expenses for 1912 with gas at $1.00 per M cubic feet, and including occupation tax, would have been $180,639.00, and the net income $46,658.00, whereas the Master ought to have found, stated and certified that with gas at $1.00 per thousand cubic feet and including occupation tax as shown by the record, the operating expenses would have been $204,078.97 and the net income $23,637.56."

## XXXVII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and deter-
150 mining that the net income for 1912 with gas at $1.00 M. cubic feet in the City of Lincoln would have been $23,637.56.

## XXXVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 85 to the master's report, as follows:

"That the Master in said report stated and certified that the net income with gas at $1.00 per M cubic feet would be 66.9% on $676,-565.00, whereas the Master ought to have found, stated and certified that the net income for the year 1912 would be 3.5% on $676,565.00 and only 2.17% on the actual value of the company's property used or useful in the gas business in the city of Lincoln, January 1, 1913."

## XXXIX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining and so decreeing that the net income for the year 191[illegible] with gas at $1.00 per M cubic feet in the city of Lincoln would have been 3.5% on the valuation assumed by the Special Master, and 2.17% on the

actual or present value of the plaintiff's property, used and useful in the gas business in the city of Lincoln, January 1, 1913.

XL.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 86 to the master's report, as follows:

"That the Master in said report stated and certified the total value of the company's property used or useful in the gas business in the city of Lincoln, January 1st, 1913, to be $676,565.00, whereas the Master ought to have found, stated and certified such value to be not less than $1,090,913.00 as shown by the record."

151 XLI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining that the total present value of the plaintiff's property used and useful in the gas business in the city of Lincoln, January 1st, 1913, to be the sum of $1,090,913.00.

XLII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 88 to the Master's report, as follows:

"That the Master in said report stated and certified that $10,000.00 is a sufficient allowance for depreciation for the year 1907, whereas the Master ought to have found, stated and certified that $14,955.00 was the necessary and reasonable allowance to charge for depreciation, as shown by the records."

XLIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not finding and determining that the necessary and reasonable allowance for depreciation for the year 1907 of the plaintiff's property was the sum of $14,955.00.

XLIV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 90 to the master's report, as follows:

"That the Master in said report stated and certified that with gas at $1.00 for the year 1907 the net income would have been $22,-
349.00, whereas the Master ought to have found, stated and
152 certified that under the conditions named the net income for the year 1907 — have been $18,129.24."

## XLV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 91 to the master's report, as follows:

"That the Master in said report stated and certified that on his assumption of net income and on his erroneous assumption of value for the year 1907 the net income was 5.12% on the value of the plaintiff's investment in 1907. Whereas the Master ought to have found, stated and certified that the net income for the year 1907 was in fact as shown by the records only 2.31% on the value of the plaintiff's investment in 1907."

## XLVI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 95 to the master's report, as follows:

"That the Master in said report stated and certified that the question of whether the franchise is perpetual or temporary is not material in this case and that the said franchise, however valuable it might be, could in no way affect the rate, which the public service corporations may charge its customers, whereas the Master ought to have found, stated and certified that the question did materially affect the case and the rate of return, as well as its value and the rates, which the corporation might charge, as shown by the record."

153

## XLVII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 96 to the master's report, as follows:

"That the Master in said report stated and certified that the bonded debt of the company far exceeds the value of its assets, whereas the Master ought to have found, stated and certified that the value of the company's assets is much greater than its bonded indebtedness."

## XLVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 100, to the master's report, as follows:

"That the Master in said report stated and certified that he cannot believe that a rate not lower than 6% upon their invested capital could be regarded as confiscatory, whereas the Master ought to have found, stated and certified that any rate under 8% was less than usually expected in business of this character in this locality, that any rate less than 8% is considered as being non-compensatory, and therefore to the extent that it is short of said 8% it is confiscatory."

## XLVIX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 101 to the master's report, as follows:

"That the Master in said report stated and certified that there is evidence in the record indicating that plaintiff regards investments in the stock of these corporations as especially desirable,
154 whereas the Master ought to have found, stated and certified that the record shows that the plaintiff company on the contrary regards its investment in this locality as being an extremely hazardous one under the existing conditions and that its stock is considered of little value in the market."

## L.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 102 to the master's report, as follows:

"That the Master in said report stated and certified that all human experience has shown that increased consumption follows quickly a reduction in the price of commodities, whereas the Master ought to have found, stated and certified, as shown by the record, that because of strenuous competition of electric and other companies the demand for gas is gradually decreasing and it has only been possible for the company to make increases in the sales of gas by the expenditure of extraordinary efforts in the establishment of a new business department at large expense during the last twelve years, and that notwithstanding these extraordinary efforts the company's output for the year 1913 shows an appreciable decrease, as compared for the year 1912."

## LI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 103 to the master's report, as follows:

"That the Master in said report stated and certified that with gas selling at $1.00 per M cubic feet, the plaintiff would have received since December 1, 1907, not less than 6% per annum upon the value of the property employed by it in servin*d* the people of Lincoln, whereas the Master ought to have found, stated and certified
155 that with gas selling at $1.00 per M. cubic feet and with the tax ordinance enforced, the company would have received on the value of its property employed in serving the people of Lincoln for the year 1907 only 2.31%; for the year 1908, only 4.44%; for the year 1909, only 4.96%; for the year 1910 only 3.95%; for the year 1911, only 3.51%; for the year 1912, not more than 2.17%; and for the year 1913, not more than 1.04%."

LII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exceptions 104, 105, and 106, wherein plaintiff excepted to the failure of the Special Master to find the reproduction cost, the assumed life and age, and the amount and rate of depreciation on each of the 73 items of Works Equipment.

LIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exceptions numbers 107, 108 and 109 and each thereof, wherein plaintiff excepted to the failure of the Special Master to find and certify the present value of each of the groups of items of property in the Distribution System, and find and certify the age and assumed life for each of said groups of property, and find and certify the amount and rate of depreciation on each of said groups of property.

LIV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 110 to the special master's report, wherein plaintiff excepted to the failure of the Special Master to find and certify the operating expenses, revenues and net incomes for the year 1913.

156 LV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 111 to the special master's report, wherein plaintiff excepted to the Special Master's failure to find and certify the reproduction cost and present value of the property of the company for 1913.

LVI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 112 to the Special Master's report, wherein plaintiff excepted to the failure of the Special Master to find and certify the reproduction cost and present value of the property of the Company for the years 1908, 1909, 1910 and 1911.

LVII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 113 to the Special Master's report, wherein plaintiff excepted to the failure of the Special Master to find and certify the rate and

amount of depreciation for each of the years 1908, 1909, 1910, 1911 and 1913.

LVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 114 to the special master's report as follows:

"That the Master failed to find and certify the amount of
157 organization and legal expenses and other costs preliminary to construction shown in the evidence in the amount of $33,000.00.

LIX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 115 to the Special Master's report, as follows:

"That the Master failed to find and certify the reproduction cost and present value of paving over mains and services."

LX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 116 to the Special Master's report, as follows:

"That the Master failed to find and certify a summary of the evidence on the values of the company's property, its operating expenses, net income and rate of return."

LXI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 117 to the Special Master's report, as follows:

"That the Master failed to find and certify the incompetency of the testimony of A. D. Adams offered on behalf of the city on questions of value of the company's property and on operating expenses and results."

158 LXII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 118 to the Special Master's report, as follows:

"That the Master failed to find and certify as to the franchise rights of the company involved in the issues necessary to be determined in valuing the company's property and in determining the operating expenses of the company and in determining the amount of depreciation, and failed to find and certify that the company had a perpetual franchise."

## LXIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's exception number 119 to the Master's report, as follows:

"That the Master in said report stated and certified that he had reached the conclusion that the ordinance in controversy has been at all times enforceable according to its terms and that the injunction heretofore granted restraining its enforcement should be vacated and complainant's bill dismissed, whereas the Master ought to have found, stated and certified that said ordinance was not enforceable and its enforcement would have denied to the company just compensation and would have resulted in confiscation of the property of the company if enforced in the years 1907, 1908, 1909, 1910, 1911, 1912, and 1913, and for each of said years, and that the injunction heretofore granted restraining the enforcement of said ordinance should be *contained* in force and made permanent."

159

## LXIV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's additional exception number 1 to the report of the Special Master, as follows:

"That the Master failed to find and certify to the extent of the application of the revenue of the years 1907, '8, '9, '10, '11, '12 and '13, each separately, to reconstruction or replacements as distinguished from currect repairs and operating expenses, and that the Master failed to find and certify the amount of past expenditures for reconstruction or replacement and past operating expenses, including current repairs for each of the years 1907, '8, '9, '10, '11, '12 and '13, and failed to find and certify how the gross receipts for the company for 1907-'13, inclusive, for each of the said years had been expended, and failed to find and certify the amount to be set aside for the year 1913 and thereafter for depreciation, and failed to find and certify the character and probable life of the property of the company and the methods adopted in the past to preserve the properties, and failed to find and certify on questions of value, operating expense, net returns, rate of return, depreciation and franchise rights of the company, being questions raised by the complainant, supported by proofs, all of which the Master was directed by the Supreme Court of the United States to fully report upon by order of the said Court in the case."

160

## LXV.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's additional exception number 7 to the report of the Special Master, as follows:

"The complainant excepts to the conclusions of the Master that deductions should be made from the value of the services in the

distribution system, on account of advancement made by consumers, and excepts to the failure of the Master to find and certify the reproduction cost and present value of the paving over mains and services for each of the years 1907 to 1913, inclusive."

## LXVI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's additional exception number 5 to the report of the Special Master, as follows:

"That the Master failed to find and certify as to the competency, materiality and relevancy of the testimony offered as to the Massachusetts and other companies offered on behalf of the complainant and failed to indicate whether such testimony bearing on the results of such companies was taken into account and given due
161 consideration on the part ot the Master in reaching the conclusions submitted; and failed to find and certify whether the increased cost and the amount thereof in the manufacture of gas by complainant, on account of the pressure ordinance and quality ordinance was taken into account and given consideration on the part of the Master in reaching conclusions submitted."

## LXVII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's additional exception number 6 to the report of the Special Master as follows:

"Complainant excepts to the conclusions submitted without a summary of the evidence being submitted therewith, and excepts to the final conclusions submitted by the Master, in view of the finding of the Master to the effect that "summerization of this evidence is quite impossible and would so far as I can see aid neither court nor counsel in testing the correctness of the conclusion I have reached," and as a result thereof the complainant is denied the benefit of the testimony offered and means of testing the correctness of the Master's conclusions, by the evidence considered by the Master.

## LXVIII.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling plaintiff's application to recommit the case to the Special Master for additional findings.

## LXIX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not decreeing that the ordinance set out in the complaint imposing an occupation tax on gas companies in the city of Lincoln to be a violation of Section
162 I of Article XIV of Amendments to the Constitution of the United States in that by its enforcement the plaintiff would be denied the equal protection of the laws.

## LXX.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in not permanently enjoining the enforcement of the ordinance of the City of Lincoln, imposing an occupation tax on gas companies in the City of Lincoln.

## LXXI.

That the District Court of the United States for the District of Nebraska, Lincoln Division, erred in overruling exception No. 94 to the Master's report as follows:

"That the Master in said report stated and certified that the occupation tax ordinance is valid, whereas the Master ought to have stated, found and certified that said ordinance if enforced would operate to confiscate the plaintiff's property, as shown by the records and should therefore and for other reasons be declared invalid and discriminatory."

Wherefore, the plaintiff prays that the said decree be reversed and the said District Court of the United States be instructed to grant the relief prayed for in plaintiff's complaint.

HALLECK F. ROSE,
E. C. STRODE,
*Solicitors for Plaintiff.*

163 *Petition for Appeal.*

Filed in the United States District Court, District of Nebraska, Lincoln Division, November 22, 1915.

To the Honorable Page Morris, District Judge of the United States, and to the Honorable United States District Court for the District of Nebraska, Lincoln Division:

The above named Lincoln Gas and Electric Light Company, plaintiff herein, feeling aggrieved by the decree made and entered in this cause on the 23rd day of September A. D. 1915, does hereby appeal from said decree to the Supreme Court of the United States for the reasons fully specified in the assignments of error which are filed herewith, and made a part hereof, and it prays that its appeal be allowed and that citation issue as provided by law, and that a transcript of the record, proceedings, and papers upon which said decree is based, duly authenticated, may be sent to the Supreme Court of the United States. And your petitioner further prays that the proper order touching the security to be required of it to perfect its appeal be made, and that a proper order be made continuing in force the injunction in this cause during the pendency of the appeal and fixing bond therefor.

HALLECK F. ROSE,
E. C. STRODE,
*Attorneys for Plaintiff.*

164 *Order of Court on Plaintiff's Application for Allowance of Appeal.*

Filed in United States District Court, District of Nebraska, Lincoln Division, November 22, 1915.

This cause having come on for hearing before me, one of the Judges of the District Court of the United States for the District of Minnesota sitting in this case by special assignment, at Minneapolis, Minnesota, within said district, on the plaintiff's petition for the allowance of an appeal:

It is hereby ordered that the petition of the plaintiff be granted and the appeal therein prayed be allowed and that a duly authenticated transcript of the record proceedings and papers upon which said decree is based be sent to the Supreme Court of the United States.

It is further ordered that the injunction in this cause be restored and held in effect during the pendency of this appeal upon the plaintiff filing bond duly approved in the sum of Five hundred seventy five thousand ($575,000) Dollars conditioned as required by law and that the same act as a supersedeas and also to keep said injunction in effect and as a bond for costs and damages on appeal.

PAGE MORRIS, *Judge.*

Dated November 22, 1915.

165 *Supersedeas Bond.*

Filed in United States District Court, District of Nebraska, Lincoln Division, November 22, 1915.

Know all men by these presents: That the Lincoln Gas & Electric Light Company, a corporation, under the laws of the State of Nebraska, the complainant herein as principal, and National Surety Company, a corporation, under the laws of the State of New York, as surety, are held and firmly bound unto the Clerk of the District Court of the United States, for the District of Nebraska, in the penal sum of Five hundred and seventy-five thousand dollars ($575,000) lawful money of the United States, to be paid to the said Clerk, and his successors in office, for the benefit of all gas consumers, who have been patrons of, and who have purchased gas from the said complainant, during the pendency of the above-entitled action, from the commencement thereof, and for all gas consumers, who shall purchase gas of the said complainant, or its successors hereafter, at any time before the final determination of said suit, and for the benefit of all whom it may concern, including the defendants herein, for which payment well and truly to be made the said principal and surety hereby bind themselves, their successors and assigns, jointly and severally, firmly by these presents.

Sealed with our seals and duly signed and executed by us this 19th day of November, A. D. 1915.

Whereas, by virtue of an order and decree entered herein on the 23rd day of September, 1915, the temporary injunction heretofore granted in said cause, restraining the defendants from putting into effect and enforcing an ordinance known as Ordinance Number 432 of the City of Lincoln, Nebraska, regulating the price of manufactured gas and fixing the price for all manufactured gas
166 sold within said city, at one dollar ($1.00) per one thousand cubic feet thereof, and providing that any Gas Company may add a penalty of not more than ten cents per one thousand cubic feet of gas sold, for non-payment after six days from the date such Gas Company has furnished a bill or statement to any consumer, and providing for a minimum monthly charge of twenty-five cents for a single gas service, was by said Court dissolved; and

Whereas, the above named Lincoln Gas & Electric Light Company has obtained an appeal to the Supreme Court of the United States, to reverse the judgment of said District Court, in said cause;

Now, therefore, the condition of this obligation is such that if the said Lincoln Gas & Electric Light Company shall prosecute its appeal to effect, or failing to make its appeal good, if it shall answer all costs and damages and refund for all over-charges, collected from gas consumers, above the price fixed by said Ordinance and shall pay to the Clerk of this Court, or his successor in office, for the benefit of all whom it may concern, and in particular for the benefit of all gas consumers entitled to refunds, all overcharges collected from such gas consumers since the granting of the original injunction in this suit, above the price for gas fixed by said Ordinance, together with interest thereon, when the several parties lawfully entitled thereto and the amount of the refund due each as aforesaid shall have been ascertained in this action in such manner as the Court shall direct, and when so ascertained, the determination to be binding upon all parties to this bond, then and when all the conditions of this bond shall have been complied with, this obligation shall be void, otherwise to be and remain in full force and effect.

My commission expires June 2nd, 1920.

168 The above and foregoing bond approved this 22nd day of November *of November,* 1915.

PAGE MORRIS, *Judge.*

Know all men by these presents, that the National Surety Company, a New York corporation, having its principal office in the City, County and State of New York, doth hereby make, constitute and appoint W. S. McCurdy and C. M. Bend of St. Paul of the state of Minnesota, its true and lawful Attorneys in Fact, with full power and authority to sign, execute, acknowledge and deliver in its name, place and stead, as surety bonds, undertakings and writings obligatory in the nature thereof, and when said bonds undertakings and writings obligatory are signed by either the said W. S. McCurdy or the said C. M. Bend as such Attorneys in Fact to bind the Company as fully and to the same extent as if the same were signed by the President of the Company, sealed with its common seal, and duly attested by its Secretary; and the said Company hereby

ratifies and confirms all the acts of the said Attorneys in Fact done pursuant to the power and authority herein given.

This power of attorney is made and executed in accordance with and by authority of a certain By-Law adopted by the Board of Directors of the National Surety Company at a meeting duly called and held on the Second day of February 1909, which reads as follows:

"Article XII.—Resident Officers and Attorney-in-Fact.

"Section 1. The President, First Vice-President or any other Vice-President may from time to time "appoint Resident Vice-Presidents,
Resident Assistant Secretaries, and Attorneys-in-Fact to rep-
169 resent and act for and "on behalf of the Company, and either the President, First Vice-President, or any other Vice President, the Board of Directors or the executive Committee may at any time remove any such Resident Vice-President, Resident Assistant Secretary or Attorney-in-fact and revoke the power and authority given him.

"Section 4. Attorneys-in-Fact.—Attorneys-in-fact may be given full power and authority to execute for and in the name and on behalf of the Company, any and all bonds, recognizances, contracts of indemnity and other writings obligatory in the nature of a bond, recognizance or conditional undertaking, and any such instrument executed by any such Attorney-in-Fact shall be as binding upon the Company as if signed by the President and sealed and attested by the Secretary."

And, at a meeting of the Board of Directors of the National Surety Company, duly called and held on the Seventh day of March, A. D. 1912, a quorum being present, the following additional section to the foregoing By-Laws was adopted:

"Section 6. Attorneys-in-Fact.—Attorneys-in-fact are hereby authorized to verify any affidavit required to be attached to bonds, recognizances or contracts of indemnity, policies of insurance and all other writings obligatory in the nature, thereof, and are also authorized and empowered to certify to a copy of any By-laws contained in Articles VI, XII and XIII of the By-laws of the Company."

In witness whereof the National Surety Company has caused these presents to be signed by its First Vice President and its corporate seal to be hereto affixed, duly attested by its Assistant Secretary, this 22nd day of May, A. D. 1912.

Lincoln Gas and Electric Light Company, a Corporation, Plaintiff, vs. The City of Lincoln et al., Defendants. Citation. Filed in Lincoln Division at — M., Nov. 24, 1915. R. C. Hoyt, Clerk, by J. H. McClay, Deputy. No. 290, O. B.

174 *Certified Copy of Order Extending Time to Prepare Transcript of Record.*

Filed in United States District Court, District of Nebraska, December 17, 1915.

Lincoln Gas & Electric Light Company having filed and presented its application for an extension of time in which to prepare and file a transcript of the record in the Supreme Court of the United States in the above entitled case, and it being made to appear that owing to the large amount of testimony taken upon the hearing of said case, and the large volume of the record necessary to be prepared for said appeal, the said record could not be prepared within thirty days from the day of the order allowing the appeal herein, and further it being made to appear that it would require an additional time of four months from December 21st 1915, in which to complete the transcript of the record in said case,

It is, therefore, ordered that the time within which to prepare and complete the transcript of the record in this case be extended for a period of four months from December 21st, 1915, and that said time is by order of said court allowed and granted to the Lincoln Gas & Electric Light Company pursuant to this order.

PAGE MORRIS, *Judge.*

Dated this 22nd day of November, 1915.

Endorsed: Filed in Lincoln Division, November 22, 1915. R. C. Hoyt, Clerk, By J. H. McClay, Deputy. Entered in order Book at No. 290.

175 UNITED STATES OF AMERICA,
*District of Nebraska, Lincoln Division, ss:*

I, R. C. Hoyt, Clerk of the Court of the United States for the district of Nebraska, do hereby certify the above and foregoing to be a true and correct copy of an order made and entered in the record of the proceedings of said Court in the above entitled case on the 22nd day of November, 1915; the original order having been mailed on the 17th day of December, 1915, to the clerk of the Supreme Court of the United States.

Witness my hand and the seal of said court at Lincoln, in said District this 17th day of December, A. D. 1915.

176 *Certified Copy of an Order Enlarging Time to Prepare and Complete Transcript.*

Filed in United States District Court, District of Nebraska, Lincoln Division, April 5, 1916.

Lincoln Gas & Electric Light Company having filed and presented its application for an extension of time in which to prepare and file a transcript of the record in the Supreme Court of the United States in the above entitled case, and it being made to appear that owing to the large amount of testimony taken upon the hearing of said case, and the large volume of the record necessary to be prepared for said appeal, and owing to the engagements and illness of counsel for the complainant the said record could not be prepared within the time heretofore allowed by the court, and it further being made to appear that it will require an additional time of four months from August 21st, 1[illegible] in which to complete the transcript of the record in said cause,

It is therefore ordered that the time in which to prepare and complete the transcript of the record in this case be extended for a period of four months from April 21st, 1916, and that said time is by order of said court allowed and granted to the Lincoln Gas & Electric Light Company pursuant to this order.

PAGE MORRIS, *Judge.*

Dated this 4th day of April, 1915.

(Revenue stamp.)

Original Order sent to U. S. Supreme Court, April 5, 1916.

178 *Stipulation.*

Filed in United States District Court, District of Nebraska, Lincoln Division, August 22, 1916.

It is hereby stipulated and agreed between the parties that owing to the inability of the clerk of the court to complete the transcript in the time heretofore allowed, that the time may be extended in which to prepare such transcript until October 20th, 1916, and that the order and citation heretofore issued and entered may be enlarged and extended until such time, and defendants waive further citation of service thereof, and consent that an order of the court may be entered in accordance with this stipulation.

Dated this 11th day of August 1916.

E. C. STRODE,
*Att'ys for Plaintiff.*
C. PETRUS PETERSON,
W. M. MORNING,
*Att'ys for Defendant.*

179 *Certified Copy of an Order Extending Time within which to Prepare Transcript.*

Filed in United States District Court, District of Nebraska, August 22, 1916.

It being made to appear to the court by the showings on file, and by the stipulation of the parties presented and filed, that owing to the large amount of testimony taken on the hearing of said case and the large volume of the record necessary to be prepared for the appeal, the said record cannot be prepared within the time heretofore granted in the order and citation of November 22nd, 1915, and the two enlargements thereof by which the time was extended to August 21,

1916; and it appearing further that the defendants by their counsel, waive further notice of any enlargement of the citation herein, and consent thereto and further waive any citation herein, and it further appearing that the citation herein issued by the court has not yet expired, it is therefore ordered that the citation herein be extended and enlarged for good cause shown until October 20th, 1916, and the time in which to prepare and complete the transcript of the record is likewise extended until such time and that this order of enlargement be filed with the clerk of said court.

Dated this 12th day of August, 1916.

Enter this order,

PAGE MORRIS, *Judge.*

DISTRICT OF NEBRASKA,
*Lincoln Division, ss:*

180 I, R. C. Hoyt, Clerk of said court here certify that the foregoing is a true and correct copy of an order made on the 12th day of August 1916, and entered on the 22nd day of August 1916.

In testimony whereof I have hereunto set my hand and affixed the seal of said court at the city of Lincoln, in said District this 22nd day of August, 1916.

[OFFICIAL SEAL.]

R. C. HOYT, *Clerk.*
J. H. McCLAY, *Deputy.*

Original order sent to U. S. Supreme Court, August 22, 1916.

181 *Order.*

Filed in United States District Court, District of Nebraska, Lincoln Division, August 22, 1916.

It appearing to the Court from the showing made and by stipulation and agreement of the parties hereto that it is desirable and proper that the original exhibits be used on the appeal as part of the record in place of copies thereof,

It is therefore ordered that the original exhibits included in volume- 1, 2 and 3 of the exhibits settled and allowed as a part of the record in this case are to be used on the appeal as the exhibits, so that copies need not be made thereof, and in the preparation of the printed record by the clerk of the court such exhibits are to be used in all respects the same as copies thereof, eliminating from such printed record exhibits Nos. 9, 10, 16, 19, 20, 21, 22, 66, 83, 84, 85, 102, 113 to 132 inclusive, 135 to 143 inclusive, 150, 226, 265 to 269 inclusive, 382, 383, and 442, 223, 224, 225, 227, 228 and 258, pursuant to agreement and stipulation of the parties.

Dated this 12th day of August, 1916.

PAGE MORRIS, *Judge.*

To the Clerk:

Enter this Order.

PAGE MORRIS, *Judge.*

182 *Præcipe and Plaintiff's Agreement.*

Filed in the United States District Court, District of Nebraska, Lincoln Division, October 4, 1916.

The clerk of said court is hereby requested to prepare a transcript of the record in the above entitled cause and file the same in the office of the Clerk of the Supreme Court of the United States under the order of Appeal and the Appeal heretofore perfected to said court and to include in said transcript the pleadings, orders, decrees, reports, exceptions and papers on file and of record in your office appurtaining to said cause, enumerated as following:

1. The condensed narrative statement of the evidence, including exhibits settled and allowed by the court as a part of the record in this case.
2. The complaint.
3. The Restraining Order of December 27th, 1906.
4. The Answer.
5. The Replication.
6. Motion for order substituting John M. Stewart, City Attorney, as one of the defendants, including the Council Record filed therewith and order of the court thereon under date of June 28th, 1909.
7. Memorandum of opinion of March 20th, 1909.
8. Decree filed April 6th, 1909.
9. Petition for allowance of appeal filed April 10th, 1909.
10. Assignments of error filed April 10th, 1909.
11. Order allowing appeal filed May 27th, 1909.
12. Mandate of the Supreme Court of the United States.
13. Order of the court appointing J. J. Sullivan Special Master.
14. Report of Special Master filed April 8th, 1914.

183 15. Second supplemental report of Special Master filed September 19th, 1914.

16. Motion of plaintiff to recommit the case to the Special Master for additional findings filed October 8th, 1914.
17. Order of the court upon plaintiff's application to recommit the report of the Special Master filed December 10th, 1914.
18. Plaintiff's exceptions to the report of the Special Master filed September 26th, 1914.
19. Plaintiff's additional exceptions to the report of the special master filed September 28th, 1914.
20. Defendant's exceptions to the report of the Special Master filed September 26th, 1914.
21. Plaintiff's application for an order authorizing and permitting the taking of further testimony with respect to the Sloan-Huddle report filed June 14th, 1915.
22. Decree filed May 23rd, 1915.
23. Order directing the papers on appeal including bond be forwarded by the Deputy Clerk of the District Court of the United States for the District of Minnesota at Minneapolis, to the Clerk of the Dis-

trict Court of the United States for the District of Nebraska, Lincoln Division, dated November 22nd, 1915, and filed on said date.

24. Plaintiff's assignments of error filed November 22nd, 1915.

25. Plaintiff's petition for appeal filed November 22nd, 1915.

26. Order of the court on plaintiff's application for allowance of the appeal dated November 22nd, 1915, and filed on said date.

27. Supersedeas bond filed November 22, 1915.

28. Citation issued November 22nd, 1915, and filed on November 24th, 1915.

184 29. Order extending and enlarging the time in which to prepare and file the transcript of the record in the Supreme Court of the United States dated November 22nd, 1915, and filed December 17th, 1915.

30. Order enlarging and extending the time in which to prepare and complete the transcript of the record dated April 4th, 1915, and filed April 5th, 1915.

31. Stipulation for extension and enlargement of time in which to prepare and complete record on appeal dated August 11th, 1916, and filed August 22nd, 1916.

32. Order enlarging and extending the time in which to prepare and complete the record on appeal, dated August 12th, 1916, filed August 22nd, 1916.

33. Order directing the use of original exhibits on appeal dated August 12th, 1916, filed August 22nd, 1916.

34. This præcipe with the acceptance of service and agreement of counsel endorsed thereon.

Said transcript to be prepared as required by the rules of the Supreme Court of the United States, and file the same with the clerk of the United States Supreme Court on or before October 20th, 1916.

E. C. STRODE,
*Attorney for Plaintiff.*

Receipt of a true copy of the foregoing præcipe for transcript of the record is hereby acknowledged this 11th day of August, 1916.

C. PETRUS PETERSON,
W. M. MORNING,
*Attorneys for —.*

It is agreed that the foregoing Præcipe enumerates all of the record proceedings and files necessary for the hearing of the cause in the Supreme Court of the United States.

Dated this 11th day of August, 1916.

C. PETRUS PETERSON,
W. M. MORNING,
*Attorneys for Defendants.*

185 As attorney for Intervenors I do not care to be heard on the appeal—and do not ask for the service of any papers on me.

JOHN M. STEWART.

September 20, 1916.

186 *Stipulation.*

Filed in the United States District Court, District of Nebraska, Lincoln Division, October 4, 1916.

It is hereby stipulated and agreed by and between the parties hereto that printing of the record as provided by an act of Congress entitled "An Act to Diminish the Expense of Pleadings on Appeal and Writs of Error or Certiorari" approved February 13, 1911, is waived and election made to take the record in the United States Supreme Court and there to be printed under the supervision of the Clerk of said court under the rules and practice of said court.

Dated this 11th day of August, 1916.

E. C. STRODE,
*Attorney for Plaintiff.*
C. PETRUS PETERSON,
W. M. MORNING,
*Attorneys for Defendants.*

187 United States District Court, District of Nebraska, Lincoln Division.

I, R. C. Hoyt, Clerk of said court hereby certify that in obedience to rules of the United States Supreme Court and rules of this court and in compliance with the præcipe for transcript of the record, and agreements and stipulations in regard thereto, this record is made and certified to be true and faithful transcript of the pleadings, proceedings and evidence of record and file in the office of the clerk of said court as mentioned in said præcipe for transcript, in the matter of Lincoln Gas & Electric Light Company versus the City of Lincoln, No. 10 Docket A.

It is further certified that said transcript of the record consists of two volumes, lettered A and B respectively; that Volume A contains an agreed statement of the evidence as settled and allowed by the trial judge, covering 1853 pages numbered consecutively from 1 to 1853 inclusive; that Volume B to which this certificate is attached, contains pleadings, orders and other proceeding, covering one title page, one index page and 186 pages of transcript of the record, numbered consecutively from 1 to 186 inclusive.

It is further certified that the three volumes of exhibits designated Vol. 1, Vol. 2 and Vol. 3 respectively and each bearing the authenticating certificate of Hon. John J. Sullivan, the Special Master before whom the evidence in this case was taken, Stipulation as to inclusion and exclusion in printing the record, and original order of Hon. Page Morris, settling and allowing and transmitted herewith, constitutes a part of the original record filed by Special Master John J. Sullivan and referred to in his certificate.

188 Volume One contains the exhibits received with the testimony of Henry I. Lea and are lettered consecutively A to X inclusive.

Volume Two contains the exhibits received with the testimony of A. D. Adams and are numbered consecutively from 180 to 440 inclusive.

Volume Three contains 422 miscellaneous exhibits numbered consecutively from 1 to 422 inclusive.

Witness my hand as Clerk, and the seal of said Court, at Lincoln, Nebraska this 14th day *day* of October, 1916.

[Seal United States District Court, District of Nebraska, Lincoln Division.]

R. C. HOYT, *Clerk,*
J. H. McCLAY, *Deputy.*

[United States internal revenue documentary stamp, series of 1914, ten cents, cancelled 10/14/16. J. H. M.]

189 In the Supreme Court of the United States.

LINCOLN GAS & ELECTRIC LIGHT COMPANY, a Corporation, Plaintiff,

vs.

THE CITY OF LINCOLN et al., Defendants.

*Stipulation.*

It is hereby stipulated and agreed that the clerk of the Supreme Court of the United States in the preparation of the printed record on appeal in this case shall omit therefrom exhibits 9, 10, 16, 19, 20, 21, 22, 66, 83, 84, 85, 102, 113 to 132 inclusive, 135 to 143 inclusive, 150, 223, 224, 225, 226, 227, 228, 258, 265 to 269 inclusive, 382, 383, and 442 in the above case for the reason that the matters contained in such exhibits are fully covered by the testimony of witnesses or other exhibits, or are deemed by the parties hereto immaterial under the issues of this appeal.

Dated December 30th, 1916.

W. M. MORNING,
C. PETRUS PETERSON,
*Attorneys for Defendants.*
CHAS. A. FRUAUFF,
E. C. STRODE,

190 [Endorsed:] 744/25,574. In the Supreme Court of the United States. Lincoln Gas & Electric Light Company, a corporation, Plaintiff, vs. The City of Lincoln et al., Defendants. Stipulation.

191 [Endorsed:] File No. 25,574. Supreme Court U. S. October Term, 1916. Term No. 744. Lincoln Gas & Electric Light Co., Appellant, vs. The City of Lincoln et al. Stipulation to omit parts of record in printing. Filed January 20, 1917.

1–5 In the District Court of the United States, District of Nebraska, Lincoln Division.

LINCOLN GAS & ELECTRIC LIGHT COMPANY, a Corporation, Plaintiff,

vs.

THE CITY OF LINCOLN, NEBRASKA, et al., Defendants.

Appearances:

For plaintiff: E. C. Strode, Esq., and Halleck F. Rose, Esq.
For defendants: C. Petrus Peterson, Esq., City Attorney, and W. M. Morning, Esq.

LINCOLN, NEBRASKA, August 11th, A. D. 1916.

Received of the attorneys for the plaintiff the within condensed statement of the evidence, including the exhibits, for examination and amendment.

C. PETRUS PETERSON,
W. M. MORNING,
*Attorneys for Defendants.*

LINCOLN, NEBRASKA, August 11th, A. D. 1916.

We herewith return the within proposed condensed statement of the evidence and exhibits, with no amendments, and consent to its allowance and settlement by the court.

C. PETRUS PETERSON,
W. M. MORNING,
*Attorneys for Defendants.*

6 Be it remembered, that on the 21st day of March, A. D. 1913, hearing was begun in the above entitled cause before Honorable J. J. Sullivan, Special Master, and said hearing was concluded on the 14th day of March, A. D. 1914, and the report of said Special Master was filed with the Court on the 8th day of September, A. D. 1914; and thereupon on the 23d day of September, A. D. 1915, the findings of fact and conclusions of law of said Special Master were by the Honorable Page Morris, Judge Presiding duly confirmed; Messrs. E. C. Strode and H. F. Rose, appearing for the plaintiff, and Messrs. Fred C. Foster, and W. M. Morning appearing for the defendant City of Lincoln et al.; at which said hearing before said Special Master the plaintiff and the defendant City of Lincoln introduced and offered evidence and testimony as hereinafter set forth, and objections were made thereto, rulings had thereon, and exceptions taken to the same as follows:

7 MICHAEL E. MALONE, being first duly sworn, testified on behalf of the complainant as follows, pages 68 to 93, printed transcript:

Direct examination by Mr. Rose:

I am 48 years of age and reside at Denver. I do gas engineering work. At present I am employed as superintendent of the gas department by the Denver Gas & Electric Light Co. I started in 20 years or more ago in the gas business as a clerk and worked up to be superintendent. I worked at Columbus, Ohio, and Madison, Wisc., and Denver, Colo., and have had occasion at different times during those 20 years to put in all kinds of gas apparatus in those places, and in addition on my own hook I have built some two or three different gas plants complete, and have also made a number of reports on plants and put additions to them both in the distribution system as well as in the manufacturing plant. I am, and have been for the past ten years, familiar with the price of material going into the construction of gas plants, and also the price of labor and know what equipments are required, and I am familiar with the requirements of such properties as the Lincoln Gas & Electric Light Company's plant at Lincoln. I made an examination of the physical properties of the Lincoln Gas & Electric Light Co. used in its gas department about two months ago. I spent five days here at that time, three of which were put in entirely at the plant. I measured up the apparatus and made a note of everything then took it to the office here and went over it and had some correspondence with the manufacturers to enable me to get the price at present on such apparatus. I also had access to the plats of the mains and books of the company and I examined them. I went over them carefully and measured up on the maps all of the different streets where the streets were paved and unpaved to find out the number of miles of mains they had, the different qualities and amounts under paved streets, and dirt streets. I took a buggy and drove out over most of the mains, and I checked it up so as to make a detailed state-

8 ment of the property and its value. Gas was discovered back about 1792. Since then the manufacturing process has been greatly improved. At present the manufacture of coal gas is really a destructive distillation of coal in a retort usually made of fire clay. The retorts are erected in what is called gas furnaces or benches, the number of benches depending on the size of the plant, running all the way from three to nine retorts and sometimes more, a bench. There are what are called free or plain fire benches, and also what are commonly called recuperative or regenerative furnaces. In modern and up-to-date plants they generally have one of these furnaces and they draw the hot coke directly into the furnace. Attached to three of these benches also are what are called bench fuel economizers, whereby some of the gases are drawn back under the grate bars and the inert gas is converted into combustible gas which saves a great deal of expense in fuel. The retort or retorts are hermetrically sealed and the air is excluded from the retorts, the gas passing up what is called a standpipe attached to the front of the re-

tort or mouthpiece. From there it is delivered into a hydraulic main. It might be called a water pump to prevent the gas from coming back to the retort and exploding or igniting. From the hydraulic main the gas usually passes into a primary condenser to reduce the temperature of the gas and drive off the globules of tar, etc. Before this the temperature is as high as 175° and we try to draw it down to 130° at the exhauster, which is the next apparatus to the primary condenser, when it is cool. The purpose of the gas exhausters is to draw the gas from the retorts through the hydraulic main at what is called atmospheric pressure or vacuum line from which point it is forced through a series of apparatuses for scrubbing and condensing. The first apparatus is what is usually called the tar extractor which takes up a certain percentage of tar and varies in different plants with different forms of gas. 50% of what is remaining after what is taken off at the main is taken off by the extractor.

From the extractor the gas goes through a series of air or water tube condensers, some plants having one or two and others as high as ten or twelve. From the condensers it is driven through one or more tower scrubbers, sometimes as high as 120 ft.; usually, though, from 30 to 60 ft. These scrubbers are filled with cork or other suitable material, wooden blocks, or trays, the gas passing in at the bottom and passing through this material in a counter-current to the liquid with which it is washed. The liquid is ammoniacal water in most cases though in some cases they use plain clear water. From these scrubbers the gas then passes to what is called the rotary scrubber. This is the condition in Lincoln, and is the last vessel for the removal of the remaining particles of tar and ammonia gas. From the rotary scrubber the gas passes to the purifying boxes, usually four in number. However, these vary according to the size of the plant. The gas passes through the purifying material in these boxes. The material usually used in this country at the present time is called oxide of iron or iron sponge, made from iron borings and from corn cobs, shavings, ground cork, or any like material that is used as a carrier of the oxide of iron preventing it caking and making a back pressure. From these boxes the gas passes to the station meter which is a meter of sufficient capacity to take all of the amount of gas made every hour which varies at different periods of the 24 hours. This meter measures all of the gas at whatever the temperature of the atmosphere or room may be at the time the gas passes through the correction being made to reduce this to a standard condition which is 60° temperature and 30° barometric pressure. From the meter the gas passes to what is commonly called the storage holder. Due to the fact that in most large cities at the present time holders are not built of sufficient weight to give the desired pressure for the ordinary distribution system, it becomes necessary to pump the gas from the holder and force it into the street mains under an initial pressure of 3, 5, or 6 inches of water column.

What we call "water column," 1 inch in height, that is, normal, reduced to pounds three and four-tenths or 3.4 inch would represent only two ounces of sea level. From the holder the gas passes through the main transmission and then into the distributing

main and service pipes into the houses where it is measured by the consumer's meter.

Water gas is manufactured by what is called the decomposition of steam by passing it through a fuel bed varying in depth from five to eight or nine feet. The steam is first pre-heated to a high temperature, generally delivered into the machine at about 80 pounds pressure. That is what is commonly called water gas. Up to this point it is a blue gas having no luminosity whatever. It goes as a rule through the fuel bed from the bottom up though there are machines which have reverse runs. After passing through this fuel bed it goes into what is called the carburetor at which point gas-making oil is admitted for the purpose of enrichment. The oil used is generally called a gas listillate. Oil is very high at present and it is necessary to use a grade of oil that is not prohibitive and gas distillate is a grade of oil from which one or two lighter distillates have been taken at the refinery. It is hardly a product of petroleum. Some of the petroleum is taken from it but it is a crude oil with one or two distillates taken off and one of the distillates is petroleum for which they get a very much higher price. The balance makes just as good a gas but not so much of it as it would make if the petroleum was left in. The vessel in which the oil is admitted is called the carburetor. That is where the carbon is admitted to the gas and brought from a blue gas up to what is called the carburetted water gas. The gas then passes down through the carburetor which is filled with fire brick arranged in a checker-work fashion laid on edge and staggered so the gas is compelled to permeate through the entire mass of fire brick through the openings where it is
11 partly fixed into a gas. It then crosses over to the third vessel called the superheated which is filled with fire brick. Here is where it gets its final fixing and is finally fixed into a permanent gas-y form, little of it being reduced back to a liquid form. From this vessel it passes through the seal pot which is identical to the hydraulic main in the coal gas. From there it passes to the various condensers, scrubbers, washers, and coolers similar to those used in the manufacture of coal gas and from these it passes to the relief holder. The relief holder of a water gas plant is for the purpose of storing the gas as fast as it is made, it usually being made much faster than the apparatus can handle it. It is pumped from this holder and forced through the apparatus, purifiers, etc., at a rate at which the apparatus is able to handle it. It is then measured through the station meter the same as the coal gas and stored in the storage holder from where it is delivered mixed with the coal gas. The mixture in most plants is made at the entrance to the purifying apparatus. The two gases are mixed and generally in the proper proportion and pass together through the boxes and are measured, in most cases, jointly. In a great many cases they keep the entire system separate. I know of four kinds of coal in the United States that are really suitable for gas-making. These are the Virginia coal, the Youghiogheny coal of Pennsylvania, the Fairmont, and some other good coals of West Virginia, some good coal from around Trinidad, Colorado, and some from Washington. Most all the other

coals are simply steam or domestic coal. I understand that the coal used here in Lincoln comes from Pennsylvania. It is cheaper to buy the Youghiogheny coal from Pennsylvania at present although the freight is up to $4.50. One of the best steam coals in the country comes from Hocking, Ohio. It has about three and a half feet of gas per pound of coal. The Youghiogheny coal has usually
12 about five feet. If you were to put up a plant to handle the Ohio coal you would have to have a plant that much larger to handle the same output. Also, coal that is over one per cent sulphur is almost prohibitive. I have seen so much sulphur in the gas during coal strikes that we had to almost shut down the plant. The people couldn't use the gas in their houses and the cost of apparatus to take out one or more per cent of sulphur per pound of coal would be such that we couldn't use it. Coal that has a high percentage of gas cannot be used frequently because of such a considerable percentage of sulphur in it. That is true of Kansas coal. It would be practical to use the Kansas coal if a plant had about ten times the ordinary scrubbing, condensing, and purifying capacity but it would not be economical or efficient. They had to discontinue using it right here. It adds very much to the economical efficiency of the plant to be able to manufacture both coal and water gas.

Sometimes you are at the mercy of the oil market which is controlled by the Standard Oil Co., principally, and if you have nothing but a water gas plant they raise the price of oil at will. I have known them to do that with other companies, and it is necessary to have both processes in order to operate that which is the cheapest—either coal or water gas. The same thing would occur if you had an exclusive coal gas plant. They might raise the price of coal and put it out of business. It makes your system more flexible. You can operate part of either. It is also necessary at times to have a water gas plant in order to bring up your candle power requirements. In a great many cities the candle power requirements are such that by the use of coal alone you are unable to bring it up to the necessary requirements. You can also manufacture the coke by the coal gas process and use it in the water gas process, and you can do it much cheaper than you can buy it in ordinary quantities. In large furnaces you can use coke for making both coal and water gas. I don't know as I would regard the plant here as efficient for results, considering the
13 size of the town and the plant. The water gas and coal benches are not modern and up-to-date, but the balance of the system is in good shape as are also the purifiers. They have just rebuilt the furnaces in the coal gas plant and they are modern. The quality of the gas is all right but the cost of manufacture is more. They have one machine called a springer water gas set. It has all three compartments in one cell instead of having three cylindrical vessels in line to pass the gas through. This is an old-fashioned machine. It cost a good deal of money when it was put in but it is not modern and you don't get the efficiency that you would from modern machinery. It is not used regularly now and is only there as a relief set. It is used in emergencies when they are called upon to make up a deficiency which they are not able to make in the coal gas plant.

It was one of the first pieces of apparatus put on the market and was regarded as efficient at that time. I have done over the inventory of the company's property and have checked over the cost of replacement. I am not so familiar with the cost of the real estate and I had to take the opinion of outside parties on that but that is a very small item. I made a detailed estimate of the replacement value of the physical properties which I made from my inspection. The cost of the physical properties alone exclusive of getting the money, organization, etc., is $691,000. This does not include any of the property used in the manufacture and distribution of electricity with the possible exception that the steam plant is installed in the electric department and we had to estimate the steam power capacity necessary to operate the gas plant, and the building for it, and all items that are used in common by both departments have been apportioned so that the estimates that I am giving hereafter include only the gas plant. To replace the present coal gas manufacturing apparatus would cost $80,605; the water gas apparatus would cost $31,503; the buildings at the gas plant exclusive of the electric plant would cost $37,-
14 289. The real estate, including the two-thirds of the ground occupied, would cost $7,200; two-thirds of the total real estate is used by the gas plant and one-third by the electric plant. In fact, they have such a large storage for coke and oil that they probably use over two-thirds of the ground for the gas plant.

There are 62 miles of street mains. Their replacement cost which includes the cost of relaying the paving where the mains are under paved streets is $220,605. The service pipes which include the cost of repaving and cost of permits, amounts to $107,106. The gas meters in use have a replacement cost of $36,282; the meter connections, $13,184; piping for gas ranges, $16,500. The engineering expense on $550,272, at 2½% which is a very low figure, is $13,756. The next item is the contingent expense. This is an expense which will accrue on many jobs of $5,000 and upwards and on large jobs the large corporations or factories allow for contingent expenses. I have never had any experience putting in a plant of this size but I have placed it here at 12½%. It varies all the way from 5% to 20%, and would run at least 12%. That contingent expense does not include the expense of engineering. Neither does it take in the real estate. On the figures, $543,072.76, the amount of it is $67,884.09. The working capital amounts to $59,146, which makes up the total of $691,000. The estimates that I have given above include the cost of the material and labor and contemplates the items in place as they now are. In addition to this, other expenses would necessarily be incurred in constructing a plant. You would have to have an engineer make plans and designs and you would have to have superintendence. Page one of my report is headed Coal Gas Apparatus, and it covers all of the apparatus used in that department. It shows in detail each piece of equipment and my estimate of the replacement cost for each. This apparatus is now in actual use by the company and this replacement cost contemplates entirely new stuff. My report is marked Exhibit 1. The next heading in this exhibit shows all of the water

gas apparatus in the local plant and opposite each item of
15 equipment is found my opinion and estimate of the reasonable replacement value and the cost of each of those items. The next subdivision in this exhibit is headed Real Estate and Buildings. The company has a full block of 12 lots for its plant, and I have given my estimate of 8 lots which is two-thirds of a block. That portion I estimate is used exclusively for the gas plant. I have specifically described each one of the buildings and the furnishings and opposite each I have given my estimate and opinion of the replacement cost and value, and also of the real estate. Where part of these buildings are used jointly by both departments I have given the replacement value of the portion used by the gas department. I don't think the sewage system could be replaced in that wet ground for the amount I have given. The total cost of the real estate and buildings I have estimated, as shown by this exhibit, at $44,486. The next heading of this exhibit is Cost of Replacing Gas Main Distribution System in dirt streets and there I have given the total miles of main in dirt streets and the number of miles of each kind and opposite each I have given my estimate of the replacement cost. The total cost is $90,578, which includes the permits for digging up the streets for which they charge you 50¢ each. This, in my opinion, is a good, fair average cost in a great many cities I have had experience in, and I think it would be more than fair here. There is nothing included in this sum for engineering and contingent liabilities nor for accidents or anything of that kind, and plants of that kind are not constructed without detailed engineering plans. It is also a fact that there is a certain element of hazard in work of this kind that increases the cost over and above the cost of material and labor. I have known of explosions to take place in a system of that kind in a number of miles of main at the same time and this is an element that ought to be
taken into consideration. On the next page of this exhibit I
16 have shown the miles of main of each size under paved streets and opposite each I have shown the cost of replacing. The total cost of replacing the mains under paved streets of this company in Lincoln is $130,027, which includes the permits at 50¢ each and this is exclusive of any contingent expenses or liability of accident and attorney's charges and financing, and does not include broken pipe. It is just the actual cost of labor and material. In actual practice in order to find what the cost is you must add to these items the percentages for contingent expenses and engineering cost, broken pipes, attorney's fees, and financing.

I have next shown the number of services under dirt streets and then follows the services under the different kinds of pavement and opposite each is my estimate of the cost of replacing each kind. The services are pipes laid from the gas main in the street to the residence or lot which is to receive the gas service. They are a necessary part of the construction of a gas system, and in actual practice these services are largely placed clear into the residence at the expense of the company. They do that in order to promote the gas business and the consumption and sale of gas. The total cost of all the services amounts to $107,106.82. In my opinion this is the fair and reason-

able replacement cost of these services. The number of the services under the wooden block pavement were estimated. It took a long while to make that up and there are some mistakes in it but it is more than fair. There are more services under the asphalt pavement and there are more expenses under such a condition than when the services are under the dirt streets. The next item I have shown in this exhibit is the cost of the gas meter connections. The fair and reasonable replacement cost of these connections is $13,184. After we get to the end of our service pipe we generally have to run ten or fifteen feet of pipe to the location of the meter. The consumers frequently insist that the meter be placed on a certain wall to get away from the furnace or ice box or coal bin or something, and the aver-
17 age length of this pipe is ten to twelve feet. Then there are two sets of meter connections. Sometimes they are made of lead pipe which contains a shut-off cock so that in case of accident you can shut the meter off, and two unions that screw on to the meter, and altogether we estimate these connections to cost about $2.25 each, $1.05 being for the material and $1.25 for the labor. These connections are necessary in order to sell the gas to the individual tenant, and in actual practice this company has to make them.

The next item in this exhibit is piping for the gas ranges. These pipes commence at the meter and run from there to the gas range, and the estimated distance is about 30 feet. They generally use ¾-inch pipe and in ordinary use these pipes cost about $3 apiece, which includes the labor. It is necessary to do this to promote the sale of gas, and the work must be done very carefully to avoid drips and leaks. The cost of maintenance on one of these things if not done right is very heavy. The total replacement cost of the piping for gas ranges, in my opinion, is $16,500. The next heading in my exhibit shows the details of the gas meters that are owned and set up by the company, showing the number of each kind and the replacement cost. The aggregate value of the company's meters in actual use is $36,282.90. I next show in my exhibit the items making up the working capital, which totals $59,146.88. I consulted with the manager of the company and ascertained the amount of stock necessary to carry and from that I made this table. The coal needed here for gas making purposes comes from Pittsburgh. It is several days in transit and in order to guard against strikes, floods, and other contingencies which might arrise they aim to carry an average stock of 3,300 tons. The fluctuations of the market does not affect ordinarily the size of the coal stock because the coal is usually contracted for at a certain season of the year for one or two year periods and the price remains the same throughout that
18 period. The usual term of credit extended to the patrons of the company is over a month and the company cannot operate and withhold payment for its fuel and labor, and the like of that until the bills are paid. During that time the company has to pay its own labor and material bills. Usually the labor is paid twice a month. I have known that in order to keep the workmen we have to pay them daily, and weekly at least. It is customary to carry about 90-days' stock of coal. 30-days' stock of oil is about

all that is necessary to be carried. Unless you carry that much a railroad wreck may put the plant out of business. This is also true with pipe stock. You must carry a reasonable stock on hand as you may meet with accidents and it will be necessary to replace some of your mains. Also, extensions are sometimes put in on short notice and it is necessary that about a mile and a half, or something like that, of pipe be carried. It is customary to carry that much. The same consideration requires the company to keep on hand a stock of tools and supplies sufficient to operate from 30 to 60 days. In addition to those I have mentioned it is necessary to carry 30 to 60 days' stock of purifying materials. Also, pipe stock, all kinds of brass goods, fittings, supplies of gas ranges, water heaters, and other domestic and industrial fuel appliances, tools, steam fuel, coke, office stationery, and in addition a sum of money necessary to meet pay-rolls and freight, things that have to be met weekly, semi-monthly, or monthly, must be carried. The amount I have given here as working capital is necessary to operate a plant of the size here. I have included in the working capital the office rooms, work rooms, and office appliances. I have gone over and taken a sort of invoice of the company's property now actually employed, and substantially the items shown in the schedule are in actual use by the company. This amount, I am satisfied, is a very reasonable sum and would not be considered large. I have worked out very carefully, perhaps more carefully than any other one item, the amount of pipe under the paved streets and I have tabulated it, showing every block of pipe under paved streets.

19

I compiled this report deliberately and altogether I put in about fourteen days. I spent five days my first trip here, three days my second trip, and I went over it several times at Denver. I also had several conversations with interested parties and in addition I had quite a number of people working for me. I have not included in the figures I have given anything for interest on the money invested before the plant was put in operation. In a plant of this size the capital in the original cost would be invested on an average of about a year before there would be any return. It might be nine months and it might take fifteen, but a year is a fair average, and it would be necessary to invest $631,000 for one year before there would be any return on it. The rate is usually 5% and the interest during this period would be $31,595.65. My company in Denver has sold bonds to a considerable extent and I know the cost there of getting money and from my connection with this business I know the cost in other places from hearing people talking and discussing it. I have assisted in selling some of the Denver plant's notes. Mr. Henry L. Doherty is president of that company and Mr. Frueauff is vice-president and general manager. I have never handled it with brokers direct. I know that the cost of procuring funds and financing an enterprise of the kind here runs from 15% to 20%. Part of that per cent is allowed for discount on bonds. They generally allow two or three per cent discount. I am also acquainted with the cost of pipe and have taken that into consideration as well as the cost of other machinery. It is customary when we buy appa-

ratus for plants to get quotations from different firms, figures and specifications and blue prints of their apparatus, and the cost of foundations and everything connected with it. The cost price is higher now than it has been in former years and the price of oil has been going up for the past five years, and coal for the
20 last two or three years. Also, the price of labor is increasing very rapidly. It has increased 50% in Denver in the last year and a half. The labor and material used in the manufacture and distribution of gas in the past five years has increased. It is much higher at present. The rise has been more in the last three years. On the whole I think both the water and coal gas departments of this plant are reasonably sufficient with the exception of the one machinery there that is called the springer gas set. That is the machine that was purchased and installed at the time the plant was moved to its present locality. At that time it was considered reasonably up-to-date and efficient. Since then they have invented improvements to water gas apparatus that are considered a great deal more efficient than that particular style, and later on the company here purchased a new one. They now manage to make all the water gas with the new machine and occasionally, however, they find it necessary to fall back on this springer machine to take care of the increased send-out due to something like a State Fair. It is simply an emergency or reserve set to be used in instances of that kind or if the other machine should break down, need a relining or anything of that kind. It is perfectly satisfactory as an emergency but I would not want to use it continuously. I think this location makes the cost of gas high on account of the chance you run of getting out of supplies. That is, the price is high as compared with other locations. That holds good principally on all supplies that enter into the manufacture of gas, principally coal. It is not quite so bad on the oil. You are a great distance from the pipe, coal, and oil markets and the cost has increased because you have to carry a large supply—larger than ordinary, and in addition you have to pay the cost of delivery here. The proportion of the number of services per mile of main here is a little better if anything than in the average town. It is much more scattered in Den-
21 ver in proportion to the population but the situation is much better in Madison, Wisc. It would not compare with New York City at all. There they have a consumer every fifteen or twenty feet on account of their high buildings. It is not as favorable in the heart of the city here as in Denver but taking the city as a whole I think it is a little more favorable here. The cost of manufacturing gas in a town like Lincoln situated in this locality, on account of the long distance from supplies, is necessarily larger than it is in other cities closer to lake freights on the Great Lakes and railroad centers, and to coal mines and iron supplies. Denver is better situated on account of the coal market. They get their coal much cheaper there than here, and also oil and there are extensive iron works at Pueblo, located 117 miles from Denver. There is also in connection with the work of this kind the expense of organizing the company, and also the cost of procuring a franchise and the right

to do business. There is considerable cost of that nature attached to every company and it doesn't run in proportion to the size of the company. It ordinarily requires the employment of time and labor and attorneys to draw ordinances and to get them through. The cost of organizing a company in a city of this size I estimate would be $24,950, which includes the cost of securing a franchise. The cost of obtaining the money at 20% is $149,512, and this, with the interest and other items, amounts in all to $904,572. This does not include the value of the franchise. A company is also required to expend money to promote the sales throughout the time to work up the patronage in order to get up to the present patronage of this company. Also, there is required advertising, which requires a considerable sum—more than is needed for most articles that are put on the market for sale. The cost per stove runs from five to fifteen dollars, depending on the town and locality, and in addition where there is a new gas plant it costs a great deal more to get it started. When people get educated to the gas it is not
22 quite so expensive. I have estimated what that item of cost is in Lincoln, and have shown the number of stoves in use. The schedules that I have gotten up are correct to my personal knowledge. I do not think there is any error in them. I know they are correct so far as extensions and prices are concerned. In Denver we have 210 miles of main and 26,000 services. Here there are only 62 miles of main with 5,597 services. There are more services per mile of main in Denver than there are in Lincoln. There are 120 per mile there and it is less than 90 here. As a rule, where a company is as old as this one and has been in the business as long they have more services than they have here, and they are not so scattered. This town itself is built up pretty well. The small number of services per mile of main requires a great deal more mains to obtain a certain number of customers per mile.

MICHEAL E. MALONE, recalled for further cross-examination, testified on behalf of the complainant as follows, pages 179 to 201, printed transcript:

Cross-examination by Mr. Stewart:

My valuation of the coal and water gas apparatus was of what it would cost the company to replace them in Lincoln and not what they originally cost them. On the springer water gas set the amount of money estimated represents the value of an up-to-date machine that would make the amount of gas that that machine does. I understand that it cost over $9,000 when new but I could buy one now for $6,700 that would make as much gas. I would not buy one like that now and would give but little for that kind of a machine. I have done the same thing all the way through—figured on new and up-to-date apparatus. On the 2-inch pipe I figured 25¢ a foot approximately, which is 13¢ for the pipe and 12¢ for excavation, back filling, tamping, and watering. The next size is 4-inch pipe, and that figures about $3,150 a mile. I think the pipe cost about $30 a ton which is about 55¢ a foot and the labor cost is $1.75

for ten hours. The 6-inch pipe is $4,660 a mile, and the
23 pipe costs $30.85 a ton. These quotations were gotton especially for this location. The balance was for labor and back filling and runs about 46¢ per foot. These figures include the lead, yarn, wood to melt your material, and coke. The 6-inch pipe is $30 a ton or 55¢ a foot. The cost of stringing is 1¢ a foot; of digging and back filling, about 15¢, varying from 12¢ to 18¢; laying and handling is 5¢; lead and yarn, 7¢; hauling wood, coal, coke, and different fuels used, 7¢. This makes it 87¢. I took the back filling at $1.15, making it 90¢ instead of 87¢. The labor cost is figured at $1.75. They pay that for eight hours in Denver. I don't know what they pay here. On the paved streets I took the same figures as on the dirt streets plus the expense of taking up and putting down the paving. On the wooden block paving I figured $1 a square yard to tear up and replace the old concrete base. I got this from actual figures of cost furnished me by the superintendent here. That is with the trench 2½ ft. wide at the top, for the 6-inch pipe. On the two-course brick pavement it requires 1/6 of a yard of sand to cover one square yard of surface. This at $1 a yard would make that item 16¢. It takes about 100 brick on a two-course pavement. I allowed only 50 because I assumed that you could use 50 brick out of the two-courses taken up. The 50 brick at $18 a thousand would amount to 90¢. The labor would be 50¢, which makes the total of $1.56 per square yard. I have a total of 15,375 square yards of two-course brick pavement over the mains on a total of 61,500 lineal feet. On the asphalt pavement the cost of removing the concrete is $1 a square yard. That would have to be let by contract. $2.50 for the asphalt makes a total of $3.50 for the cost of re-surfacing trenches 2 ft. wide. There were 10,922 square yards. The total of the three items of taking up and replacing pavement is $63,378. The balance of the cost of mains in the paved streets is

the ordinary cost of excavating, supplying the pipe, back
24 filling, yarn, lead, and the other little items. The service pipes in dirt streets cost $13.50 each. That is on the average length of service required in Lincoln. The pipe costs 6⅔¢ per foot; the excavating and back filling costs about 15¢ or 16¢. It is a little more than on a main because you have the curb stone and you have to punch a hole through the front cellar wall and must also avoid trees and bushes. 16¢ is generally what we figure. The labor of stringing is 1¢. The labor of laying and handling is 3¢; this makes 26⅔¢ per running foot. And then it costs $1 for the permit. The average length of service pipe in Denver is 67 ft. It would run about 70 or 75 ft. here. I don't remember just what distance I did take. I find that I have here 50 ft. to the service. The streets are 120 ft., 100 ft., 80 ft., and 60 ft. On the services under wooden block pavement the same items would enter into the cost and that would enter into the cost of the mains under wooden block pavement. The rate per service under wooden block pavement is $19.66 as against $16.50. The difference is the cost. Multiply 13.50 by 854 services and the difference between that and the other amount

would be the cost of replacing the two-course brick pavement on services.

In the cost of meters I figured on the ordinary dry gas meter which is about the only style in vogue. There are a dozen or more manufacturing this meter in the United States and they all run about the same price. These prices I have given are the wholesale price. There are cheaper prices but I doubt if they can be bought any cheaper here. The figures given under the heading, Cost of Organizing were secured from different sources, some in Denver, some in Lincoln, and for some I had to make special inquiry. The attorney's fees are Denver prices. I have never had any actual experience in organizing a company except in a very minor degree. I don't pretent to have much actual personal knowledge on that. I did not mean to say that this total sum, $24,950 included the cost of getting a franchise. When I was asked about that I
25 thought they were referring to attorney's fees. I didn't mean going into city councils and lobbying or anything like that. I know of one case where it cost $300,000 to get a franchise. You can't get them in Colorado at this price but I don't know anything about this company. The item, $67,884.09, contingent expenses, is 12½% on the original cost of the plant. It reads 2½% and should be 12½%. That is to cover possible contingencies that might involve an expense during the progress of the work.

I have never had anything to do with the handling and managing of finances in the construction of a plant nor in raising the capital. I have helped here and there in getting the charter or franchise but not very much. I have had experience in regard to items like contingent expenses. I have been in touch daily for ten or twelve years. No engineer would put in a service without putting in an estimate of the cost in advance. No building or apparatus is put in without first having to have a requisition gotton out before the requisition on the purchasing agent is allowed to go through. I don't know what the actual contingent expenses were in the construction of the Lincoln plant but I know what it would amount to in the replacing of that plant. You might come out ahead or behind. It varies. Lots of times you come out behind regardless of how high you make it. I have in here an item of interest on money invested in the construction of a plant for a year and I mean by that that the entire cost of the plant is invested for a whole year without any return. It is not customary to lay some mains and service pipes so that they could begin to sell gas. They generally complete their plant and put in a reasonable number of miles. I wouldn't think that they would start here until they had 40 miles completed. I think it would take about a year to do that. They have almost two years on their plant at Salt Lake City, but in order to get enough miles of mains down to afford to start the plant it would take a year. It might be done in nine months and it
26 might take fifteen months. You wouldn't have to have the whole $631,000 the whole year but you would have to get your money. You would have to put the money into it as required. You would first have to borrow it because you wouldn't start the

plant unless you knew where you were going to get your money. It would be a risk not to have your money idle. I would be very careful to see that I could put my hands on it when I wanted it. It is customary to do that also in street improvements and in municipalities. You couldn't very well draw interest on it unless you put it in the bank for a year before you drew it out. I don't see any way out of it unless you could loan it for a short time. I have seen $5000,000 laid idle in the county treasurer's office for upwards of three years. I would borrrow the $59,146 of working capital a year in advance. You have to have your money all in advance. It is hard to get a second loan. It is safer to get it all in advance. I think that is the way it is ordinarily done. Lots of times you have $50,000 or $60,000 to go on that they allow for accidents. You might kill a man and for law-suits and lots of things that might enter into the matter. It is the best way to have all of your money on hand before you start the work—even the working capital.

It is a fact that they sold stoves in Salt Lake City for over a year and had their full force of supervisors at work and had a carload put in residences and connected up and had their office room running full force for over a year before they commenced to sell the gas. You would hardly need 3,000 tons of coal on hand all that year but you would need it when you got to making gas. This 20% for the cost of obtaining the money, that is what has to be paid in case you don't have any money to build the plant with and are going to borrow all of it. He might have other security to put up before the plant was completed but he wouldn't put them up. The same thing is done with street railways and telephone companies.

Redirect examination by Mr. Rose:

27 There is considerable inevitable depreciation every year of the property entering into a gas plant. This is due to natural deterioration and accidents from every cause. It is also due to the demands upon the plant out-growing the capacity of the equipment originally installed. I know of one instance in particular where the manager of the gas company insisted on having a new purifying house, in fact, everything but the generators and benches re-built because they were too small. He asked for 16-inch pipe connections with different apparatus. At that time they were 8-inch and he wanted to jump them up 16-inches. He knew it would cost a good deal of money and cause a loss to tear it out. They put in 12-inch and inside of six years they had to tear them out and it wasn't over a month and a half and then they went to 18-inch.

There is no certain way in which engineers can anticipate future demands on a public utility plant of this character. It is all guess work and you have to be a good guesser. In a town like Lincoln was a few years ago, had there been an effort to anticipate the future demands upon this plant it would have been necessary to increase the capacity requirements from 50% to 100%. If you anticipate increase regardless of depending on good times and a profitable

business you may put your plant out of business. There is no way to get rates to double the capitalization and then wait for development. I don't know of anybody willing to invest money that way. The revenues would not be sufficient to pay the interest on the invested capital for such excessive requirements. This same principle more than holds good in respect to the laying of mains. I have known of mains put down in Denver that were expected to take care of a certain district that had to be taken up in less than eighteen months. That would be true in any city where the center was shifting. That was in a paved street, too. These instances are incidental hazards of this business and they occur quite frequently,

28 and are a necessary consequence of conducting plants of this kind. In my opinion the item of depreciation is a necessary item in the maintenance of a plant of this kind, in addition to, and outside of the item of ordinary repairs and maintenance. It is necessary to allow a sum for depreciation outside of what is actually expended in ordinary repairs to maintain the integrity of the plant. The depreciation account should be entirely separate from the repair and maintenance account. The item of depreciation would apply to the larger appliances such as holders and machinery and water gas sets and coal gas benches. All of them are subjected to more or less hazard and to danger from explosions. Steam boilers in constant operation for 24 hours a day at the pressure they are required to stand in a plant of this kind would have an ordinary life of from seven to eight or maybe ten years, but I have known them to be thrown out in three years in a larger plant, not because of depreciation but because they were too small. They put in larger boilers taking up less space. I have also contended that 5% should be allowed for depreciation outside of the items of repair and maintenance. I have heard lots of engineers say it was too small but I think that would cover it in an ordinary gas plant. I think people who invest their capital in a utility of this kind are entitled to have the plant kept up to its efficiency so that the replacement for new material *material* would represent the capital upon which the company was entitled to derive its revenues. If it was not kept up they would be justified in censuring the management.

I have gone over the system of classification used by this company in the manufacturing end of it. I did not pay much attention to the financial end. I watched the classifications for the cost of manufacturing and distribution pretty closely. We used the identical system at Denver. All of the companies in the McMillan syndicate use the same system of reports. I think this system of distributing the manufacturing cost and all of the items of manufacturing is just and correct. I think it is an ideal and good system.

It is the best system in the country. I think this particular

29 style of classification is the most accurate and just. No other system for this industry would approach it in accuracy. I have heard of one that expects to be better but it is not yet in actual operation.

Recross-examination by Mr. Stewart:

The McMillan syndicate owns and controls a number of gas plants. Mr. Doherty is president of the Denver company. The Denver company don't belong to the syndicate. I am superintendent of the gas department of the Denver company. We pay 6¢ a gallon for oil there and we pay $4 per ton for Colorado coal. I think we pay more for oil there than they do here and less for coal. The kind of gas we make in the greater quantity depends on the condition of our apparatus. Sometimes we make more water gas and sometimes more coal gas. We are making very little water gas now. At the present our annual output amounts to about half-and-half but ordinarily we make more coal gas. We are able to make gas cheaper in Denver because we get the material at a lower rate. The labor cost is about the same. We also make a greater quantity there which would, even at the same price for material, make the cost less. I have seen the cost of gas in Denver go upward to 50¢ a thousand. It varies. It is in the neighborhood of 50¢ per thousand now. That is just the cost of manufacturing. The distribution cost will run from 30¢ to 35¢. The Denver plant and this plant are run under the same system of accounts and they are under the same general management and the president of that company is the president of this company. Even if the repairs to the worn out pumps and broken mains and apparatus are taken care of in the general operating expense account there would still have to be a further fund provided to take care of natural depreciation. Even if you keep your plant up to a reasonable degree of efficiency you have still got to provide a fund to take care of depreciation. In one of these we had occasion to put down 1,200 feet of 2-inch main in boxes covered with pitch to protect it from electrolysis. In three months half of it was eaten out and they had to be replaced and the other half we are going to take out now and put it through a bridge to get away from electrolysis. This was done from funds in the operating expenses account. If we charged up the replacements to operating expenses we wouldn't have enough receipts left to take care of it at the time. Even though the funds set aside for operating expenses are sufficient to take care of repairs as they go along you still need another fund to take care of the depreciation. You can't take care of it entirely through the operating expense. If you did you would keep on repairing until the plant falls down and after a number of years you would have to tear it down and put up a new one. There is a limit on repairs on everything. Of course, when you pay for a replacement of a particular part out of the operating expenses you don't need a depreciation fund to take — of that particular part. If you set aside 70¢ on every thousand feet of gas for operating expenses and to take care of the necessary repairs and replacements that would be just the same as to set aside 60¢ for operating expenses and 10¢ for general depreciation, but you would have to take care that the repairs didn't eat up the entire 70¢. Theoretically that is an adequate provision. I have known gas mains to last eighteen or twenty

years and have known them to go out in seven months. The average life of wrought iron mains is eight to ten years, taking into consideration all sorts of depreciation. It depends somewhat on the nature of the soil. I do not know what the soil is here and what affect it has on wrought iron pipes. Cast iron mains will last from sixteen to twenty years and maybe twenty-five years; depending on the weight and grade. 4-inch pipe that runs 20 pounds to a foot and water pipe running 26 pounds to a foot and pipe running 30 pounds to a foot—those kinds will last longer. I think the standard pipe that they have here would run about 30 pounds to the foot for 4-inch pipe. I have read some articles in tech-
31 nical journals on the life of cast iron gas mains but they are not always reliable. The depreciation is 5% on the cost of the article which is put away. The history of a gas plant for 25 years might show what was the necessary expense for depreciation. I have known of cases where it wouldn't. Lots of plants today are selling less gas than they did 25 years ago and that would have a bearing on the depreciation. It would vary in almost every town. If a person who was thoroughly acquainted with the operation of the gas plant for 25 years and was capable of judging he would be better qualified to judge what was necessary to be charged for depreciation than some outsider. I never heard until within the last week that anyone ever thought that anything less than 5% was adequate for depreciation. I have heard lately that 4% was sufficient. It usually runs as high as 10%. I would rather have for depreciation 5% of the value of the plant than 5% on the receipts. The 5% of the value is carried on each year and they spend it if they have any replacements to make. Lots of times they have to spend it every year. I never knew of a company where the gross receipts were greater than the capital unless it was the Standard Oil.

Redirect examination by Mr. Rose:

The details of the $24,000 organization expenses is on page 8 of my report. The item there for the value of the franchise is simply left blank. My details did not show that anything was paid for the franchise. I have there for filing articles of incorporation with the Secretary of State at $250. I understood the filing fee in this state was 50¢ a thousand. With an authorized capital stock of two and a quarter millions the filing fee would amount to $1,125, and in that respect my estimate of the item of organization is very much too low. The usual and ordinary repairs and maintenance charges are paid daily by companies of this sort, and this 5% depreciation which I have mentioned is required to maintain the plant over and
32 above the item of ordinary repairs and maintenance. It has always been provided for in every company that I have ever worked for. This 5% is on the actual cost of the buildings of the plant and any other portion and not on the receipts. It is figured on the actual replacement cost of the manufacturing and distribution plant. The figures I gave on the old springer water gas set were less

than what it would cost to replace it, and were less than the original cost. On the other items in my estimate the figures give what are the sums necessary to replace equipment of the same identical type and to replace the identical plant. The springer set is the only exception. I figured 2-inch wrought iron mains foot for foot wherever the company has them and the same is true of cast iron mains and buildings and sheds and everything that the company now has.

Cross-examination by Mr. Stewart:

There have been no material changes in meters in the last ten or twenty years. The type is identically the same as it has been for 50 years. There has been a little improvement here and there. A difference in material perhaps and possibly an extra rivet is about the only change. I allow 5% depreciation on the actual cost of the plant. That would not apply to the real estate. That would enhance if anything. The market has advanced on some of the other apparatus required in the gas plant and in making up this schedule I advanced the price over what it cost from ten to twenty per cent, but I would still allow 5% depreciation on it. Even if a machine put in a year ago had increased 10% in value I would still allow the 5% depreciation. It might depreciate 50% during the year. It is an average condition. There are always contingencies that might arise that would be bound to keep the actual percentage at 5% depreciation. If natural gas should come in here this plant would be on the bum right away and you would have to sell it for junk. There are two or three towns in Kansas where that has happened. That is one of the greatest
33 hazards and must be provided against. Some put depreciation as high as 15%. Prof. Bemis, one of the greatest authorities in the United States, has put it as high as 15%. We have got it right in Denver. I would capitalize this company for $2,200,000 if I thought that I was going to require that amount of money to build this plant and would need it inside of a year or eighteen months. I would not capitalize it for more than what my plant would amount to in the course of a year *to* two. I would build wisely, or aim to at least run three or four years. You cannot always guess or anticipate. Prof. Bemis makes an allowance of 15% for interest and depreciation—10% is for depreciation. He divided it in that way. That is found in one of his original works. I understand he has repudiated some of those things and he has got it at a lower figure but still claims 5%. I do not think that is based on receipts from consumers.

Redirect examination by Mr. Rose:

Equipment will always depreciate. Even though of greater value it cannot be sold second-hand. Depreciation from wearing out is a physical change. If would depreciate even if you operated it only one day. It would be just as good but you couldn't get anywhere near as much for it. I would think 75% would be right. Appreciation and depreciation are based upon entirely different conditions. The fact that the price of material had fluctuated would not affect the fact that the plant had depreciated and would affect physical condition.

34 WILLIAM BRADFORD, being first duly sworn, testified on behalf of the complainant as follows, pages 93 to 97, printed transcript:

Direct examination by Mr. Rose:

I am an engineer and I graduated from the electrical engineering course at the University of Wisconsin, with additional work in chemistry. The electrical engineering course includes work in mechanical engineering, steam engineering, and work of that kind. I live in Lincoln at the present time. I am superintendent of the manufacturing department of the gas company. The year following my graduation at Wisconsin I was at the University as an instructor in experimental engineering. After leaving Wisconsin I went to Denver with the Denver Gas & Electric Light Company, and spent three months there working at the gas plant and then I came here and spent nine months as gas engineer at the plant until last July, when I took this position as superintendent of the manufacture. My total experience here is two years and I have had immediate and direct charge of the manufacturing plant at Lincoln, and I am acquainted with the processes in use here. Compared with the same size plant under local conditions I think the manufacturing plant of this company here in Lincoln is an efficient plant. We get as nearly the maximum gas out of the product used in the manufacture at as low a cost as could be expected under conditions here. I have access to the books of the company. I have made and assisted to make an examination to classify the consumers of this plant according to the amount of gas consumed per meter, and I probably spent four or five days on that. I worked a good deal with Mr. Warner, the secretary. He lives in Lincoln, also. The actual work of getting the summaries off the books was done by the regular bookkeepers and some of the other employees about the company. There was a tabulation compiled by Mr. Warner, myself, and others giving the classifications. This tabulation is Exhibit A. Exhibit B is the form in which we worked on it. The classifications contained

35 in this tabulation are correct as far as my knowledge and examination extends. The general summary was gotton into this form by Mr. Honeywell from the data which had been gathered together. I am familiar with the station cost of the manufacture of gas of the plaintiff company for the year ending December 31, 1906. The data showing the cost of the manufacture from time to time is furnished to the accountants from various sources. The cost of the material is taken from the general books and compiled in one general report. The manufacturing data is furnished by myself. In addition there is the distribution cost and the collection cost and the general cost. I have done over the reports to ascertain from actual experience what it cost the company for the manufacture of gas per thousand cubic feet for the year ending December 31, 1906. The total cost for that year was 82.68¢ per thousand cubic feet. The total manufacturing cost, net, was 47.89¢ per thousand cubic feet. That is exclusive of the cost of distribution without any interest on the cost of the plant or administration costs of

any character or collection. It is just the material and labor. It does not include the cost of promoting the business. The manufacturing cost of coal gas was 54.26¢ per thousand feet; of water gas, 41.95¢ per thousand feet. By employing both systems in the same plant it lowers the cost because from the coal gas we can produce our own coke for the water gas cheaper than it can be secured by buying it on the open market. Also, to depend on oil or coal alone is not so good as this since in this way we have both to fall back on. With the regulations we have and the standard of quality the cost on the general average of using both systems is about the same. The quality required here is 625 B. T. U. per thousand cubic feet of gas, and a candle power of 18. A B. T. U. is the British thermal unit. It is the measure of heat value. It is the amount of heat required to raise one pound of water one degree, Fahrenheit. A candle
36 power is the light given out by a standard sperm candle. From my personal knowledge of the cost of manufacture these costs as I have given them are correct.

37 B. C. ADAMS, being first duly sworn, testified on behalf of the complainant as follows, pages 97 to 101, printed transcript:

Direct examination by Mr. Rose:

I am in the gas and electric light business. I live in Lincoln and am employed by the Lincoln Gas & Electric Light Company as general superintendent. I graduated from the University of Wisconsin in 1903 and worked for three years after that with the Madison Gas & Electric Co. at Madison, Wisc. In July of 1906 I was transferred to Lincoln and have been with this company since. I am familiar with the manufacture of gas. I have, due to my position, been compelled to keep in touch with the reports of the manufacturing and distribution of gas from month to month. I have made no further examination than that. It has been my business to run the manufacturing end of it as well as the distribution. I am thoroughly acquainted with the machinery and equipment of the Lincoln plant. In my opinion the efficiency of this plant for economical manufacture and distribution of gas in view of the size of the town and the plant is first class. The quality standard of gas in Lincoln is 625 heat units and 18 candle power per thousand cubic feet. That is high as compared with the standards ordinarily in general use in cities of this class, and is higher than the standard in common and general use by companies situated as this one is. That standard increases the cost of the manufacture of gas. Our distance from the market of all of the materials that we use increases the cost of the manufacture of gas because of the freight we have to pay on the materials. In my opinion any eastern town is much more compact than Lincoln. You cannot get services to the pipe laid at the intersections of crossings. In the last year and a half we have lost between 15% and 20% of gas between the station meter and the consumers' meters. That is due to the fact that the pipes

will leak through the joints. The gas is a volatile substance
38 and hard to hold. It is absolutely impossible to construct a system at a reasonable cost that will not have leaks. The gas unaccounted for in the year 1906 ending December 31st was 16.56% of the gas manufactured. The average cost for that year of the mixed gas in the holder was 47.89¢. That is just the manufactured gas and does not include anything for distribution or interest on capital or collecting or leakage or stolen or lost gas from any cause. The cost of the coal gas manufactured that year was 54.26¢ per thousand feet. The water gas cost 41.95¢ per thousand cubic feet. The cost of manufacturing and distribution exclusive of any interest on capital was 82.68¢. As far as I know these costs are absolutely correct. These reports are made up by the bookkeepers but I know where we spend the money and approximately how much it should cost per thousand each month. The expense of manufacture of gas has increased during the past two or three years in Lincoln because of the increased cost of material and labor. The cost of the material for the manufacture and distribution has increased all the way from ten to twenty per cent. The trend of the market in all of these supplies that we require has been on the increase for the past five years. I was connected with the construction of the Madison plant for a year and a half and have been in actual charge of the construction of this plant since July of last year. I helped Mr. Malone in his items of construction shown in his testimony. I went over the items of the mains and equipment and figured the necessary cost in labor and material and such things as that, and I have been over it with him to see that there were no discrepancies. In my opinion the actual cost of the replacement of the Lincoln property are the figures given by Mr. Malone. I know his standing as an expert and gas engineer. It is good, and he is a practical man.

B. C. ADAMS, being recalled for further examination, testified on behalf of the complainant as follows, pages 465 to 468, printed transcript:

39 Direct examination by Mr. Rose:

I supervise and superintend the work of construction in the streets and am familiar with the improvements that are made and with what the practical requirements for trenches and the like of that are. In actual experience a trench 18 inches wide must be dug to lay a 2-inch main in dirt. If the trench must be put under asphalt pavement the width required is 24 inches. If you open a brick pavement you must make a trench 26 inches wide. For a 4-inch main the trench in dirt must be 18 inches wide, and for asphalt pavement, 24 inches wide, and for brick, 26 inches. A 6-inch main in dirt must have a trench 20 inches wide; asphalt, 26 inches wide; brick, 28 inches wide. For an 8-inch main the trench in dirt must be 24 inches wide; asphalt, 30 inches; brick, 32 inches. The trench for 8-inch pipe must be 4 ft. 8 in. deep; for a 10-inch

main we dig 24 in. wide in dirt; 30 inches in asphalt; and a trench 32 in. wide in brick pavement, and they are 4 ft. 10 in. deep on the average. 12-inch iron pipe require 30-inch trenches in dirt; 36 in. in asphalt; and 38 in. in brick, and the average depth is 5 ft. A 16-inch main requires a 30-inch trench in dirt; 36 in. in asphalt; and 38 in. in brick, and the average depth is 5 ft. 4 in. 18-in. mains require 38 inches in dirt; 42 in. in asphalt; and 44 in. in brick. The average depth is 5 ft. 6 in. 20-in. mains require 36 in. in dirt; 42 in. in asphalt; and 44 in. in brick. The average depth is 5 ft. 8 in. Our 1¼-in. service requires an 18-inch dirt; 24 in. in asphalt; 26 in. in brick. The average depth is 3 ft. 6 in. In trenches this deep in order to make connections workmen have to go in and work with tools and a workman cannot work with efficiency and profit in a trench only 12 in. wide. I give the orders for this work. We have tunneled and bored in streets but we do it very seldom. We consider it bad practice because when you tunnel in this soil it is almost impossible to make it straight and the tool will twist and turn, and go upward, and the pipe after
40 going in follows the grade left by the tool and will not drain properly. It reduces its capacity by collecting moisture in the low portions and reduces the cross-section of the pipe available for the passage of gas. There is wooden block pavement here in Lincoln and we have been called upon to make openings in it and we have gas mains under them. I do not know whether or not these blocks have concrete under them. It has been reported to me that there is concrete under them. It is poor practice and there is no economy where the capacity of the main of any section is deficient to leave the old main there and attempt to re-enforce the service by digging another trench and laying another pipe parallel to it of the same or smaller size because it is cheaper to take up the smaller pipe and put in a larger pipe in its place. That figures in the saving of the cost of pipe and in leaking the gas mains after being laid. If you have two pipe- you have to take care of two instead of one and the old main can be used. It can be taken out and used in sections farther from the center of distribution where its size will be equal to the demand upon it.

Cross-examination by Mr. Stewart:

There is some wooden block pavement around the University grounds on the north side. There is a block there and there is a block down on F street west of 11th. What there is of it is so rough that a man has to hang on with both hands to keep his seat in a buggy.

41 HOMER HONEYWELL, being first duly sworn, testified on behalf of the complainant as follows, pages 101 to 139, printed transcript:

Direct examination by Mr. Rose:

I live in Lincoln and am general manager for the Lincoln Gas & Electric Light Co. I am 35 years of age and have been in the

gas business 17 years the first day of October. I have done nothing else for a livelihood since I left school. It is the only employment I have had. All of the time has been in the employ of the Lincoln plant here and I am familiar with the properties of this gas company. I have been general manager since February 1, 1904. Prior to that time I was bookkeeper, collector, and general roustabout. When I first went into the employ of this company, D. E. Thompson was the active head and J. K. Honeywell was the practical manager and head of the office. I am his son. I am familiar with the books and accounts of this company, and all of the employees of this company are under my immediate supervision and control. I have gone through all of the books and accounts to ascertain the actual investment made by the company in its properties here used in the manufacture and distribution of gas alone, and I have compiled some tabulations to show the cost of the properties. The books of the company are voluminous. This examination was made in the offices of the company and the books that I had access to are here in the offices open to the inspection of the solicitor for the defendants in this case. It is not practicable or possible for the court to go over all of the volumes of records that I have examined. I have been in touch with the reports made up monthly of the cost of manufacturing and distributing gas for the years 1906 and 1907, and have looked over those accounts and also the early books that were gotten up, and also the classification or summary. I did not do all the actual work myself but I did part of it and it was under my charge. It is impossible for one man to go through all of
42 these and do all of the work within reasonable bounds and get it out. It is a work of great magnitude to prepare these summaries. I think I had eight men working on the slips we got out. Some of them worked as many as twelve days. I have worked on it altogether, not devoting all my time, about six weeks. I compiled summaries annually. Exhibit C is a correct resume of the business of the gas department for the year ending December 31, 1906. Exhibit D is a correct report and resume of the business done in the gas department for the year ending June 30, 1907. We have competition in the lighting business from electricity, coal oil, gasolene plants. and gasolene lamps. The Lincoln Light, Heat & Power Co. is competing with us in the electric business and the city is furnishing the street lighting. The city does not do any commercial lighting. The city is now lighting their engine houses, etc., where heretofore they have had gas lighting. There is not a day but what electricity comes in direct competition with gas for illumination purposes. The companies operating in the electric field have not been, and are not at this time, subject to any occupation tax such as is imposed by one of the ordinances against the gas company. Gas is sold for both lighting and fuel. We have to compete with hard coal, soft coal, wood, gasolene, and coal oil stoves. I never heard of any of the dealers in these commodities having to submit to any occupation tax of 2½% or any other sum. This company was organized in March, 1872. The original company was the Lincoln Gas Company. They continued to do business until October, 1890, I think. At that time they purchased

an electric plant and ran both gas and electricity under the name of the Lincoln Gas Company until June, 1900, when the name was changed to the Lincoln Gas & Electric Light Company. There was a new company formed. The Lincoln Gas & Electric Light Company purchased the properties from the Lincoln Gas & Electric Company. The Lincoln Gas & Electric Company got their franchise
from the Lincoln Gas Company, and the franchise, and the
43 books and accounts, and everything were transferred right
through the three corporations. I have served under the administration of each of these companies. The books of the original company, the Lincoln Gas and Electric Company, are at the office down stairs. The books that I have gone over were the books kept from the inception of their organization of the original company, up to June 30, 1907. Something over $603,000 has been expended for the acquisition of the company's properties which they now hold in Lincoln for the manufacture and distribution of gas. That sum does not include anything for discount on bonds. It does include organization expenses. I do not remember the amount but they are quite modest. I don't think it includes anything for the value of the franchise. I haven't seen anything.

I can produce the schedule of the items that make up the $603,000. They are itemized by years. Real estate, apparatus, and other portions of the structural organization entering into the construction of the manufacturing and distributing plants at this time is greater than it was at the time this money was put in. It is of greater value now than when it was bought. The Lincoln Gas and Electric Company purchased this property in May, 1900, and that was the first change in the organization since 1873. The Lincoln Gas and Electric Light Company took the property over on December 19, 1901. I do not know on what terms. The Gas & Electric Company took over $333,000 of bonds on the property and took $1,000,000 of stock for which they paid $40 a share, or $400,000. In round numbers the company paid last year for taxes, $10,000. For the year ending just now the revenues from our gas department are considerably in excess of the revenues of the electric department. Two-thirds of the value of the plant is in the gas department and we apportion two-thirds of the taxes to the gas department, which would be $6,600 and some odd dollars. Our bond interest last year was $59,000 in round numbers.
It would be proper to charge two-thirds of that to the gas de-
44 partment. It is not divided, however, like taxes. The correct amount of bonds outstanding is approximately $1,129,-
600. The $333,000 of these bonds draw 6% and the balance, 5%. I do not know what the holders of these bonds paid for them or whether they were sold in the market for actual cash. Some of them were issued during my administration. We issued them for extensions and improvements to our property. Those bonds that have been issued since my time have been paid for with money. I do not know how much the company got for each $1,000 bond outstanding for those issued. During my administration we got 100% on the dollar. When we issued $10,000 worth of bonds that is what we got back for them. I do not know what they sold for but I know that is

what we got. They have not been marketable and we have not been able to sell them for the last two years, and we could not get any money for them except at a ruinous rate of discount. We have had emergencies in the last two years that have required the borrowing of funds. There was one stock option where we tried to borrow $100,000. We were able to get it but it had to be taken up by some of the officers interested in our company. We issued notes bearing 6% interest payable semi-annually, and they carried an option to buy stock at 10¢ on the dollar for $1,000,000. We couldn't float it here and it had to be taken up by some of the officers in order to carry on business. At the present time we are trying to float a loan of $1,000,000. We have made the interest on the notes and they run for two years at 7%, payable semi-annually, and have put up as collateral for those notes $200,000 in bonds, and we haven't been able to sell those notes and I have an offer of 2% to anybody who can sell them in addition to the 7%. I have not been able to dispose of any of them at that rate. We have tried Chicago, Kansas City, Denver, New York, Omaha, and any place where we thought they had money. There has been no time in the past three years when the 7% notes of the company would command par at the market, and there has been no time during my administration when the 5% bonds of the company would command par or any figure within 20% of par. That is the reason that we issued the notes at the present time. We thought the notes would go better than the bonds. Nobody wanted the bonds. We are offering a collateral, par value of $200,000, in order to get a $100,000 loan and our 7% notes with 2% commission are going begging at that offer.

I am interested in other gas plants. I think we have here an efficient manufacturing and distributing system and I think it is an economical one. For the year ending December 31, 1906 the cost of the manufacturing and distribution per thousand feet of gas without allowing anything for interest on the investment was 82.86¢ per thousand cubic feet. The net rate received from the consumer was $1.20. The net profit applicable to interest and depreciation was $58,729.02. If we had in effect a rate of $1 with a 2½% occupation tax on the same business and the same cost we would have had $24,154.11 to apply on interest on the investment and depreciation. We sold that year 153,663,600 cubic feet of gas for which we received $184,395.02. In my opinion 10% on the entire value of the property is a fair and reasonable allowance for depreciation each year. Engineers usually count 10%. Assuming a plant valued approximately at $900,000 if we had worked at the net rate the total net revenue would have lacked $66,000 of making up the item of depreciation, and would have lacked about $30,000 of making a return of 6% on the estimate of Mr. Malone's of the value of the capital invested, $900,000. The net earnings in the last year at the present rate of income would not have been sufficient to enable the company to save anything at the legal rate of interest on the invested capital of $900,000. I could not have maintained the company solvent if I had had a rate last year of $1 and I could not at the present time. There is no possible way that we

could sell gas and make gas at a rate of $1 and get a return.
46 For the year ending June 30, 1907, as shown in Exhibit D, the net cost to the company for the manufacture and distribution of gas was 82.31¢ per thousand cubic feet. That would not allow any item for earnings of any character on the invested capital or depreciation. The net profit per thousand cubic feet before allowing for earning on invested capital and depreciation was 38.61¢. That was during a portion of the time that this ordinance would have been effective had not the injunction been issued in this case. If the occupation tax ordinance of 2½% on the gross receipts had been in force and the net rate of $1 prescribed by the ordinance had been in force the company's net profit to be applied on depreciation would have been 16.41¢ per thousand cubic feet. During that year the net average received was $1.2091 per thousand cubic feet of gas. The net profits during that year for the sale of gas before allowing for the item of depreciation and interest on the invested capital were $54,646.35. That, in my opinion, is not sufficient to maintain the plant and keep it up and does not allow any return on the investment. From these items is eliminated entirely the item of bond interest.

Lincoln is not advantageously situated for the manufacture of cheap gas. We are too far away from all of the materials that enter into it and then, too, we have a scattered town with small population, wide streets that make long services, and big stretches of main across it. And parts of the town are changing. The residential part is changing. The lots were laid out to face north and south and they are now building on the back end of the lots and facing the houses east and west which requires practically double investment along there. In the distribution system this increases the leakage and it requires more capital. I am familiar with the methods upon which the classification of consumers in Exhibits C and D are based. For the year ending December 31, 1906, we had 101 consumers or meters that used less than 1,000 cubic feet of gas per year. In order
47 for the company to come out even and get the whole cost of service the minimum bill ought to be $2 a month. If it is not that much that individual consumer does not pay the actual cost of his service with the rate at $1.20. With the rate fixed at $1 64.29% of our consumers would get their service on the flat rate system prescribed by the ordinance at less than the actual cost to the company of furnishing service without allowing anything in the cost for interest on the investment and for depreciation. 20% of our consumers at the present time bring the company one-half of its total revenue, and 80%, smaller consumers, bring the balance. On the ordinance system of level meter charges the losses on the small consumers are required to be made good by the larger and profitable consumers. $9 per year as meter rent is necessary to defray the actual cost of maintaining the meter according to the system of distribution which I think is correct. This is 75¢ per month. 25¢ per month rental permitted by the ordinance is insufficient to defray the actual cost to the company of maintaining the meter. I tabulated and classified the consumers according to the amount consumed. A level charge would reduce the unprofitable consumers just that much

more. It would make them just that much more unprofitable. It would take away some of the profit from our bigger consumers that are now helping to carry the others. You could not by a level or by a straight meter rate, reduce the rates enough to everybody to get the industrial business and get everybody to use all the gas they could. We carry a larger consumer at a less rate and still make a profit, and then we can handle the business of the small consumer. The larger consumer does not occasion so much expense. The charge that we are required to make to all persons on a level meter system, in my opinion, is such as would be prohibitive of its use by a large consumer for industrial purposes. If we were permitted to classify the rates according to consumers we
48 could then take on more profitable business than we now have. We are unable to take on that business at the present time because we must serve one and all at the same rate per thousand no matter what expense they occasion.

We have probably 50 industrial consumers in Lincoln. The two largest ones are newspaper offices. They run linotypes and melt lead and one thing and another and they have got to have the gas. We are unable under this system to take on the business of the big hotels and restaurants. They use coal ranges and charcoal burners in place of gas. If we were allowed to make a reasonable service charge or meter rental proportioned to the demand upon our plant which these large consumers would have we could after taking on their business and getting their proportion of the fixed charges or rental, make a profit at any sum that happened to be above the station charge. Because we are restricted in exactions of rentals to 25¢ and restricted in charges to small unprofitable consumers to a level meter rate the larger consumers have to pay more than what their just proportion of the expense would justify,—more than they ought to, in order to carry along the little ones. Somebody has got to pay that. We cannot sell gas at a loss. There is a flat or level meter rate charge in vogue here in Lincoln applicable to electricity. The Traction company gets 15¢ a kilowatt and 5¢ a kilowatt. There is no regulation by the city of Lincoln that requires electric companies to give the same level meter rate to all consumers of electricity. And there is no company in Lincoln in the lighting business which in actual practice makes a level rate to all consumers, large and small. I have learned that from coming in competition with them. The effect of this upon the gas business is bad. It brings to us the unprofitable consumers and takes away the profitable ones. An electric light company has the right to charge a meter rent sufficient to compensate it for the service and this enables the competing electric company to avoid taking on the unprofitable business and forces that on
49 to the gas company and enables them to take the profitable business which we could get if we had the same system in vogue. We meet that and feel that right along in our business.

Cross-examination by Mr. Stewart:

Exhibit E contains just construction. There is a well-defined line between replacements or repairs and construction. It does not in-

clude replacements in any sense at all. The plant was built new in 1900 and 1901, and those were additions and not replacements.

Redirect examination by Mr. Rose:

The total gas sales alone for the year ending June 30, 1907 were 167,445,600 cubic feet. The gross receipts were $200,693.39. If the net maximum rate after discount had been $1 per thousand we would have received for that, $167,445.60, and if we had been paying in addition to the regular property tax an occupation tax of 2½% that would have amounted to $4,186.14. The net returns on the $1.20 rate applicable to interest on the investment and depreciation were $64,646.35. Had the rate been $1 and we had been subject to the 2½% occupation tax the net receipts applicable to interest on the investment and depreciation would have been $27,212.42. That sum would have been inadequate to meet the item of depreciation alone on the valuation of the properties employed, and the company would have been unable to make any profit whatever on the capital invested. If the rate of $1 had been in effect during that year and we had been subject to this 2½% occupation tax the receipts would not have equalled the actual cost of the service, not counting anything for profit or interest on the investment. I am acquainted with the handwriting of the different persons who made entries in the books of account which I have examined during the period that I have been acquainted with the company. They were made by persons in the actual employment of the company and the entries in the books were correct so far as I know and they give a correct history of the daily transactions of the company from time to time during its existence. I have worked on these books off and on. I do not know that there are any entries in my handwriting. The gas company has been making up monthly summaries and reports of the actual condition of the business since 1900. Previous to the final passage and taking effect of the ordinance in controversy in this suit the Lincoln Gas & Electric Light Co. offered to exhibit its books of account to a committee appointed by the city council in order to prove to them that we could not supply dollar gas. That was done in open council meeting in my presence. We also asked them to suspend the rate until we could complete our investigation. They refused to do that, and they acted on it abrusquely. I do not remember that any motion was made in the city council. The suggestion of the company as I recall was received by silence. The city did not, before the passage of this ordinance, examine into, or have examined into, the details of the company's business to ascertain what was the cost of manufacture and distribution of gas in the city of Lincoln, and they did not go over the properties of the company or its books to ascertain what the cost of manufacture and distribution of gas was, and they did not ascertain the capital necessarily employed in the conduct of the business. I was present, I think, at all the meetings at which the ordinance in controversy here was introduced, read, and considered. I was a pretty regular attendant those days, and I heard the expressions made by

the councilmen on the floor of the council chamber in respect to the gas company's inability to reduce the rate to a dollar, and I heard the expressions of the members of the council of the effect of the adoption of such a rate on the solvency of the company. Mr. John S. Bishop said the only way that they would ever get the water out of the stock or bonds of the company was to put it into the hands of a receiver and he in his humble way would do all he could to bring that about. Those are about the words. He was one of the councilmen who acted on this ordinance. That statement was made
51 in open council during the discussion of this ordinance and the ordinance was afterwards passed. The passage of the dollar ordinance was also agitated in the local daily papers.

Cross-examination by Mr. Stewart:

The bonded indebtedness is $1,129,600; $333,000 draws 6%, and the balance, 5%. The outstanding stock is $2,250,000. We have not been paying any dividends on that. By hard scraping we have kept our interest on the bonded indebtedness paid up. When we sold $10,000 worth of bonds at the time we were hard-up I do not know who the purchasers were. The money was deposited to our account at New York. I don't know whether the bonds sold for 80¢, 90¢, or $1.10, or what. We sent the bonds to Emerson, McMillan and Co. They are bankers and brokers in New York City. We have issued in that way in the neighborhood of $50,000 or $60,000 of bonds. I believe those were issued in 1902. It was at a time when the present owners of the plant were the owners. The electric lighting business is conducted in connection with the gas business. The expenses, except officers' expenses, and by that I mean superintendent and superintendent of manufactures and clerical expenses and taxes, are divided accurately—just what they use. Coal is given to the electric department and they use their own oil and an accurate account is kept of that. Some is divided half and half and some, two-thirds and one-third. The receipts of the electric department are not as much as the gas department. I don't remember what the yearly receipts of the electric department are. The plant and equipment of the electric department is probably about one-third the whole investment. And we make a division of the expenses approximately one-third to the electric department and two-thirds to the gas department on the investment proposition. Exhibit E includes the amounts spent in real estate investments. When the original plant was built it was built for a certain specified contract sum and
52 with that contract they got three lots on the corner of 7th and N streets. When the gas company was moved the three lots at the corner of 7th and N streets were traded to the Burlington railroad for a block of ground known as block 79. No additional investments were made for real estate. There were additional investments made for buildings and permanent improvements, machinery and equipment and things like that and mains and services. We probably do not have on hand now all of the property that is represented as having been purchased by these various sums for the different

years. I remember of three boxes there, a central seal, etc. that we sold. Those are the only pieces of apparatus that I remember of.

The $52,247 spent in 1873 was the contract price for building the gas works at that time and I suppose included the equipment outside of the mains. Those old boxes that we sold were a part of that plant. They made a different style of gas in those days to what we do now. I think we have the holder that was bought in 1873, and possibly some oil tanks. The sums spent in 1890, $34,301; in 1891, $48,429; in 1892, $71,284, were spent when we moved the works from 7th and N streets over to the new block. They cover the construction of the buildings and apparatus and holders and laying new mains. The gas company was rejuvenated at that time and we bought new machinery and constructed practically a new plant outside of the mains. We also put in new mains. We did a big lot of new work in building this new plant and moving it over there. We did not count that as a replacement of the old plant. I think there was only one piece of apparatus that was moved over there and that was the springer water gas set. That is the one that Mr. Malone spoke about as being out-of-date. The figures I have given here include all of the expenses that went into the building of the new plant. The expenditures in 1900, 1901, and 1902 was after the time the old gas company sold out to the Lincoln Gas & Electric Company and a corporation for the new business was started and mains and services were laid and
53 new boxes and scrubbers, etc., bought. That does not include any construction for the electric department at all. It is confined strictly to the gas department. This $603,278 includes all that has been paid out in constructing the gas plant and where the plant was re-built and the old one abandoned, but it does not include replacing mains. We have an account called Main Maintenance in which that would be put. For instance, if you took up a 4-inch main worth 50¢ a foot to us and laid down an 8-inch main that was worth $1 to us we would charge construction with the difference—50¢, only. We wouldn't charge it up with the $1 again. This is only an arbitrary illustration. If the old main was entirely worn out and had to be replaced by an entirely new one it would all be charged to maintenance. No part would go to construction at all. I don't know about the old wooden mains. When they would have to lay an entirely new line there I don't know whether that would be charged up to construction or maintenance. That was before my time. There was very little of that and they would have no figure on the various matters. In 1904 we had to re-lay some of our iron mains on M street and we relaid them and put them down again. In 1901 we took up another main on P street. We took them up to give a better service and put in larger mains. We have not had to take up old lines of iron mains on account of their being worn out. We have at different places taken up parts on account of electrolysis. We do some of that right along. We have not done any of that within the last two or or three years, though. We were bothered a good deal down at Harley's corner and also at H. W. Brown's place. We probably took up a length or two there. When we took that up and put in a new main we charged that up to maintenance. We renew services right

along. We have not had to take up old lines of main laid down for a period extending back for 17 years. We had to take up an old line on 27th street when we ran out to the State Farm. It was eaten through place after place and we took it up but we did not
54 take it up because we knew it was bad but we ran a line out to the State Farm and had to put in a bigger pipe. The 2-inch main would be wrought iron and a larger main is cast iron. The cast iron pipes are the more expensive and are supposed to last longer. The wrought iron pipe is easier to lay and you can put it in more cheaply and in small sizes it does just as well. All of our 2-inch mains are wrought iron pipe and all of the mains larger than that are cast iron.

I would have some trouble in getting the details of the items making up the figures in Exhibit E, especially for the other items. For the later ones I can. As the output increases the distribution cost per thousand would be less and also the office administration. It might not be noticeable in the manufacturing. You would have to have a very big increase in output to make a small decrease in the cost of manufacture, but in the distribution and office expense there would be some difference. Our output last — was 167 million feet in round numbers. If we would double that output there would be some reduction in cost. We have had a fair increase in output. The output for the year ending June 30, 1907 shows an increase of about 14 million feet over the output for the year ending December 31, 1906. For the past five or six years there has been a general increase in the output. The net earnings for the year ending June 30, 1906 are less than the net earnings for the previous year because the material and labor and repairs have probably gone up. I could tell you just what from looking at that or getting those figures. It is a fact that notwithstanding the increase in our output the account shows a decrease in the net earnings. The fact that the distribution expense for the year ending June 30, 1907 was nearly a cent less per thousand than for the year ending December 31, 1906 was probably due to the repairs of mains and cutting down the leakage, etc. The leakage is in the distribution cost as is also the repairing of mains.
55 That is not remarkable that the distribution cost should fluctuate as much as 1¢ per thousand. The report for 1907 shows an increase over the previous one in the manufacturing cost per thousand. That is due to the increased cost of material and labor. Coal is more expensive now than the year before and oil is also, and labor is, too. It shows in the detail of this report. We pay $5.52, F. O. B. cars, Lincoln for Youghiogheny coal. In the report for the year ending June 30, 1907 we have the coal on hand marked as having cost us $6.41. That is handling it in there. That is coal all told. During the 12 months we have it charged at $5.47. We had a cheaper price and our contract price changed in April and we get credit for all the lower price coal we have in stock at that time. We take an average price on it. Coal is more expensive now. We had a lower price then. The reports show the average price. It does not show the two prices. The average for these 12 months is lower than for the previous 12 because we started in April of this year on the high price

coal. The oil stock is shown on page 11 of Exhibit D. It shows only the amount used. On page 10 is shown 67 million feet of coal gas made, and on page 11 we show 130 million feet of water gas made. That is all mixed together and it is sold and some of it leaks and some of it is used by the company. The leakage is charged to the distribution cost. 20% is not so very large a leakage for a good plant. They usually figure 10% to 20% and over 20%, in a well-constructed first-class plant. That is what other people lose by leakage. The biggest item in the distribution expense is the leakage.

On page 10, lines 1041 and 1042, the items of receipts per ton for coke sold and receipts per ton for coal carbonized are not carried out. They have been filled out from the coal stock in the rear. They are credited in the manufacturing report: Coke residuals 1004 and tar residuals 1005. The credit is taken directly to the manufacturing for the coke and tar. It is a credit there. You see, the
56 gas costs so much and then we take credit for the coke and tar made and deduct that from the cost. It is taken directly out of the manufacturing cost. You will find it down at the bottom of the manufacturing report, pounds per ton of coal carbonized, 1250 lbs.; and coke used for bench fuel, 138 lbs. That is coke used in the furnaces to head the retorts. And, tar per ton of coal carbonized, 8.8 gallons. We credit the tar at 2¢ a gallon. There is no market for it and you couldn't sell any quantity for 2¢. You have to find a market. The coke is credited at $5. I don't know what it is worth on the market. I haven't bought any coke for such a long time. We figure the return at $7 to $7.50. That is shown in the report under coal expense, the number of tons received, the amount of money, and the coke expense on there in coke stock. That means delivered at those prices. The breeze per ton is the fine part of the coke. Then you say 1250 lbs. you don't get that amount. You get 10%, the rest of the breeze is fine dust. This is included in the 1250 lb. The coke sold and coke used is 4663 tons, and is shown together. The breeze is credited up at $1 per ton. It is worthless. There is no market for it. We have the coke and breeze combined figured at $28,103, an average of $5.56 per ton, and that is the amount we have taken from the manufacturing cost of the gas. That includes some handling. The coke is credited at $5 per ton and the breeze at $1 per ton. These items have all been deducted from the manufacturing cost. In addition we get some carbon out of the retorts, but we credit that back to the manufacturing cost whenever we sell it. There is no market for it and we have to pile it up in the years. There is a small quantity of it. The water gas is not always cheaper than the coal gas. We make part coal and part water gas in order to take advantage of any market on materials and then in order to make our own coke in order to run our water gas set, and we also run both in order to keep up the calorific value in better style. I don't think we
57 could buy our coke and still manufacture water gas cheaper than what the mixed gas is costing us. I think we would have to pay $1.50 to $1.85 more a ton for the coke; possibly more at times. Ordinarily coke would cost us $7 here. We would have to get it from some plant farther east toward the coal regions.

In laying our mains we are required to keep ahead of the paving. We have taken up mains in paved streets and re-laid them. I do not recollect at the present time of laying only originally in paved streets. In the reports we spoke of using Kansas coal. That is a coal that comes from Kansas. It is used for bench fuel. We might possible have made some gas out of it but it is prohibited. We cannot do it on account of the sulphur. The gas leakage or unaccounted-for gas is ascertained by reading the consumers' meters and reading the station meter to know what the company has used and sold and the difference is what is lost and unaccounted for. Part of it is leakage, and part is condensation and that also takes in the amount covered by thefts of gas by consumers or people, so it is not all leakage. The leakage ought not to be a percentage of your manufacture. That is not a good way to put it. It ought to be a leakage per mile of main which should be reduced to a common basis. For instance, in the city of St. Joseph that has got as many miles of mains as we have I think about the same number and they use two or two and a half times as much gas. There the percentage would not be the same as here and the percentage basis doesn't signify anything there. They might put out twice as much gas but they wouldn't have in per cent twice as much leakage as we would have. The 20% of gas is gas that is unaccounted for. It doesn't say leakage. We get the check on this by reading our station meter and the consumers' meters. The engineer in the engineer's office has to take the reading of the station meter at a certain time every day—7 o'clock in the morning, and the daily send-outs are added up and as reported into the office. I have the original books. Exhibits C and D are compilations from the books made by different employees. More than one person has had a hand in it. No one person did the whole thing. It could be done by one person but for convenience it is not. My conclusion that the company
58 could not operate and pay a profit on its value if the rate was reduced to $1 a thousand is arrived at from studying the results of this plant as shown by the reports. The report shows the expense that is apportioned to the gas department. It does not show what proportion.

On page 20 is the steam account going to the electric department. We buy the steam for the gas department from the electric department. We have but one steam plant and we give the steam department credit for the steam used. I cannot tell you the rate. The figure was arrived at by running one of the boilers of the company through a stated period of time. It was gotten from actual practice. We have only one boiler house down there and the blacksmith shop and a barn that are used jointly by the gas and electric departments. The steam that we use for both departments comes from the same boilers but we arrived at the amount charged to the gas department by taking one of the boilers separately. We pay the electric department for the steam just as though we bought it from the Traction company or anybody else. The gas department is a bigger consumer of steam than the electric department. There is no ordinance regulating our charges for electricity and there is no object in appor-

tioning less expense to the electric department than should properly go there but there is an object in apportioning these expenses the way they should be because we compare our reports with other companies scattered around and we naturally are anxious to show just as good a report and that we manufacture stuff just as cheaply as any of them. And we are running these departments just as though they were two concerns as near as we can. If the electric department takes anything from the gas department they pay for it, and it is not our purpose to load anything on the gas department that is not a proper expense of that department.

59 Redirect examination by Mr. Rose:

This system of reports was not devised for the purpose of this investigation. It was gotten up by a committee from the different companies. They spent lots of time and money getting up what they thought was an ideal report so that the expenses can be analyzed. If we are high on one item the auditor knows about it under this system and we get called. Reports are made at the expiration of each month. We started to do this about 1900 or 1901. We tried to make the best showing we can as to earnings at this plant to attract prospective investors and give credit to our securities. The monthly reports are taken from the general books of the company from time to time as the business itself was transacted. They would have been in this same form if this law-suit and controversy had never arisen. The original records from which these reports are taken are here and at the disposal of the solicitor for the defendant, and I will endeavor to make up the other records which he has called for. It will be no easy job to make up the schedules of moneys invested in permanent works. It will not be a job that can be completed in a hurry. The item of $603,000 invested in the plant did not cover any investment necessary for supplies on hand and what has been termed working capital. It is necessary to keep supplies on hand and money invested in working capital because we have to have money enough to run our business longer than a month—from 45 to 60 days, because nobody pays cash for gas. They all take 30 days before they commence to pay for it. You have to keep a stock of stuff on hand and a big stock of coal on account of the distance from the market and the frequent labor troubles and strikes and you must keep pipe and meters on hand and oil and oxide, pretty nearly everything that is used. We cannot run right up to the handle. The gross income of the gas department last year was approximately in round numbers, two hundred thousand dollars, which is a little less than
$20,000 per month, and we have to manufacture and deliver
60 the sum of $20,000 worth before getting any return for it.
The discount day is the 6th of the month following that in which the gas was used, and before we get any return on it at all we have approximately invested in gas manufactured and delivered the sum of $20,000. We pay our bills and pay our pay rolls twice a month and supply bills and things of that kind are coming in constantly and we cannot get along and maintain our credit

in the bank without a balance of cash on hand. We cannot get bank accommodations unless we keep some balance on hand, ordinarily. If you do it is with difficulty and good collateral.

The filling in a coal bench will not last three years. We have tried to charge it out in that time but that is too long. By actual experience they could run 24 to 30 months but the bench would be in pretty poor shape in that time. There would be 40% or 50% depreciation on that particular class of property. We have taken out mains in recent years chiefly because of their smallness. We have had to increase their size in order to give better service. It is mechanically and practically impossible in establishing works of this character to anticipate what the future demands may be on the particular main. In recent years residences have been built and are now being built on the back ends of lots to a considerable extent and the residence district has gone farther out, and the desirable residence portion has changed. This is not due to any default in the original design of construction. Nobody could have told or can now tell where the residence section or business section was going to land. Contingencies of this kind must arise in a plant of this kind in a growing city, and they must be met as they arise. You cannot anticipate them. The Fitzgerald tract is another illustration of this. We have service there to Mrs. Fitzgerald that ran up clear from B street. Now we have to cut that and have got to run a big 2 or 4-inch main along each of those streets in order to provide for the houses that are being built there. That makes it necessary for us to lead out from our plant in a little different direction with larger mains.

61 With a new residence district developing like this we have to carry more pressure and have a bigger holder and it also loads up the leads from the holder. In order to relieve the unusual load on a small main we have to replace it with a larger one. Gas leaks at the joints and through the holes in the pipe that have been eaten by the action of some chemical in the earth. This is done by electrolysis and by some salts in the earth. The leakage under the same pressure would be increased by multiplying the services or meters along the line. The service that we have to put in ahead of the pavement is of no use at all until the lot is improved by a building except to make the little leakage. The law requires us to lay a service to every lot in advance of the paving on paved streets. This must go inside of the curb. Where property is built on the alleys we have got to take up the pavement and run a main down the street. That provision does not obviate the necessity of again lifting the pavement. There are some places where the guarantee has not yet run out that we cannot cut the pavement and put in the services where required. In order to put in service under the pavements we have to go to the city and pay a dollar for a permit to open the pavement and run a trench for the service. Then tap the main and put the pavement back as good as we can. If it is asphalt pavement we have got to get the contractors to pave it, and pay for it. In these services to vacant lots on paved streets we have to anticipate a public improvement and demand for our service. If there is not a house there for ten years we have to have the service anyhow, and in figuring replace-

ment value the new company would be required to open the pavement to put these stub services in. On that my impression is that they would not be compelled to dig up the pavement and dig a service into the lot. They would only put service into the houses where they had actual consumers. The per cent of leakage would be greater where there are only 90 meters on an average to a mile of main than it would where there were 200, because when you send double
62 the amount of gas through the mains the per cent of leakage does not increase proportionately. By adding to the number of meters on the services already made you would not increase the number of joints from which the gas leaks. We could not make all the gas we need with the water gas set that we have now, and in order to increase our capacity of water gas we would have to built another building and make new connections with the holder and new connections with the steam and boiler. The capital upon which we could claim a revenue would have to be increased. To increase the capacity of our coal gas set we would have to build on to the present house. The increase would have to be in a set of three benches of 6's. Coke and tar are our by-products here. We have no way of saving the ammonia. The $7 price that we receive for coke includes advertising, soliciting, delivery, and hauling. The tar product we burn in the boilers of the electric department and we pay the gas department 2¢ for every gallon we burn. The steam used by the gas department is credited to the electric department at the actual cost of manufacture and delivery.

I procured from the city clerk of Lincoln and the county clerk of Lancaster county the certificate showing the assessed valuation of the company's property for the year 1907. For that year we paid state and county taxes in the sum of $5,256.75. There are $6,672.53 of taxes levied against the company and payable at the office of the treasurer of Lincoln for the year 1907. 2.17% of the total taxes levied by the city of Lincoln for the year 1907 was levied against the properties of the plaintiff company. The fractional parts of lots 11 and 12 in block 77 included in the certified statement by the city treasurer and assessed to Halleck F. Rose are included because they were originally bought for the gas company's use and in order to avoid having them covered by the blanket mortgage they were put in the name of Mr. Rose. The gas company paid the considera- for the purchase and holds the unrecorded deed of Mr. Rose for the same, and the
63 gas company also collects the rents of the property. If we sold 175,000,000 cubic feet for the year 1907 the 2½% occupation tax on the gross receipts would amount to $5,250 at a $1.20 rate per thousand cubic feet, and that would make the total tax levy against this company for 1907 by the city of Lincoln and Lancaster county, $17,179.28.

Exhibits F and G offered and received in evidence.

The properties of this company are supposed to be assessed at their full value for taxation purposes. The valuation shown there are one-fifth of the actual reported valuation of the company. The city taxing authorities have included $60,000 for the value of the franchise.

Taking into account the general valuations of all of the property here in Lincoln, I think that the estimate certified here by the city and county clerks is a little high for the properties within the taxing district owned by the Lincoln Gas & Electric Light Co. I have lived here all my life and I am acquainted somewhat with the industries and enterprises located here. I think $38,977,700 is much below the actual value of all of the taxable property within the taxing district in the city of Lincoln. This is five times the amount which the city clerk has certified as the total assessed valuation of all property. We ought to have $50,000,000 worth of taxable property and I do not doubt but what there is that much within the taxing district of the city of Lincoln. I was once secretary or assistant secretary of the Lincoln Gas and Electric Light Co. and as such I held the record books of the company in my hands and these books and the record books of the companies succeeded by it are now in my charge. The handwriting of the record of the minutes of the stockholders held on July 9, 1900 of the Lincoln Gas Co. appearing on pages 162 and 163 is in the handwriting of J. K. Honeywell, and his signature is appended in his handwriting. At that time he was secretary and this book was kept by him. The entry on page 164 of another meeting of the board of directors of that company is also in his handwriting and so is the signature and at that time he was secretary of
64 the company. The same is true of the minutes on page 166.
This book is now in my custody and subject to the inspection of the solicitor for the defendants. The following portion of that record offered and received in evidence:

"Page 162, July 9, 1900, Minutes of the Meeting of the Stockholders of the Lincoln Gas Company, held July 9, 1900 at the office of the company in the city of Lincoln.

"Meeting called to order by the president, D. E. Thompson.*

"Resolved, that the treasurer and officers of this company be and they hereby are directed to sell the property, rights, and franchise of this company to the Lincoln Gas & Electric Company, and to execute and deliver to it such deeds and instruments as may be necessary to effect said transfer.

"The motion was duly seconded and upon being put was unanimously adopted."

Page 164 from the minutes of the board of directors meeting:

"Mr. Tomlinson read to the meeting a resolution passed by the stockholders at their meeting held this day directing the sale of the property, rights, and franchise of this company to the Lincoln Gas & Electric Company, and offered the following resolution and moved its adoption:

"Resolved, that the directors and officers of this company as directed by the stockholders sell the property rights, and franchise of this company to the Lincoln Gas & Electric Company, and that they cause to be prepared and execute and deliver such deeds and instruments as under the advice of counsel may be necessary to effect such transfer.

"The motion was duly seconded and the resolution unanimously passed."

The following was offered in evidence from the record of the meeting of the board of directors of July 12, 1900:

"Mr. Thompson reported that pursuant to the resolution passed at the meeting of the stockholders and directors of this com-
65 pany, its property, rights, and franchises have been sold to the Lincoln Gas & Electric Company, and that they have received the consideration therefor."

I was assistant secretary and treasurer of the Lincoln Gas & Electric Company mentioned in those minutes, and I have now in my custody in my office the minute books of the meetings of that company and on page 2 of that book the following is found, which was offered in evidence:

"Meeting of the subscribers to the capital stock of the Lincoln Gas & Electric Company.*

"It was, on motion duly made and seconded

"Resolved, that the entire capital stock of this company, to wit, 15,000 shares, par value of $100 each, be issued to the Lincoln Gas Company in consideration of, and in part payment for, the transfer to this company of the property, rights, and franchises of the Lincoln Gas Company."

It also contains the minutes of the proceedings of the board of directors held July 9, 1900, which are offered in evidence, as follows:

"It was, on motion duly made and seconded

"Resolved, that this company purchase from the Lincoln Gas Company its property, rights, and franchise, and that the officers of the company be directed to issue, upon the receipt of valid deeds, an instrument transferring to this company the property, rights, and franchises of the said Lincoln Gas Company to the party procuring such transfer and in consideration thereof, and in part payment thereof, the entire capital of this company."

Exhibit H is the book containing the record of the minutes of the proceedings of the stockholders and board of directors of the Lincoln Gas & Electric Light Company, and is produced by me. I am acquainted with and know the signature of A. Lincoln Eglinton, secretary, and Louis E. Wettling, chairman, appearing on page 5 of the record of the first meeting of stockholders held December 17, 1901.

66 The record of the passage of the preamble and resolution for the purchase of the properties of the Lincoln Gas & Electric Company, contained in Exhibit H, offered and received in evidence.

From Exhibit J, the minute book of the Lincoln Gas & Electric Company, the record of the proceedings of the stockholders' meeting held on December 18, 1901, appearing on page 26, offered and received in evidence.

Also, is offered from page 35, the record of the action of the board of directors of the Lincoln Gas and Electric Company upon the same question. I do not remember what was the outstanding indebtedness of the Lincoln Gas & Electric Company in December, 1901, which was transferred. I don't know that the underlying bonds of

$333,000 were then outstanding. I think the total bond issue at that time was about $1,000,000. The $333,000 issue is still outstanding, and I think the other bonds were taken up by the Lincoln Gas & Electric Light Company bonds.

Recross-examination by Mr. Stewart:

I don't know the details of the transfer from the Lincoln Gas & Electric Company to the Lincoln Gas & Electric Light Company. I had nothing to do with the practical turning over of the company or sale of the company. I do know of some cash being paid. There was something like $77,000 or $100,000 that was actually paid by the bondholders. I don't know under what arrangement this was done. I have heard it said that they paid $300 more to keep a thousand dollar bond. They practically got $100,000 out of it. In the transfer from the Lincoln Gas Company to the Lincoln Gas & Electric Company the stockholders of the Lincoln Gas Company were paid off in money and the Lincoln Gas & Electric Light Company assumed the mortgage of $333,000. The money was paid by Wood & Havenmeyer. I don't know how it was handled on the books. They paid the money in purchasing the stock from the stockholders.

67 The money did not go to the company. I guess there was really no cash that went to the Lincoln Gas Company. It went to the stockholders. There is no account in Exhibits C and D for additions to capital or a construction account. There are accounts for maintenance under the headings, Repair account, Service maintenance, Street maintenance, and Meter maintenance. In addition to the street main service and meter maintenance expenses they have to repair buildings and apparatus. They are called repairs rather than maintenance. The first three appear on page 13 of the report. The other repairs appear in the manufacturing report for the different departments. These items of maintenance cover the keeping of mains and services up to a certain extent. If we find a leak in a service we get out and repair it or maintain it. The taking up of a pipe and putting in a new one is included in maintenance. Whenever any of the apparatus or buildings get out of order or out of repair and we fix it up we put it in the repair account. In the case of the repair of benches you can save the iron work but you have to fill the benches out. Sometimes some of the iron work is worn out. But when you take these out and fill them up they call it bench repairs. We keep account of that in the contingent bench repair account in the general books. The total sum is charged into the operating expenses over the period that we estimate that the benches will last. The last time we thought the benches would last three years but they will not. The total bench repairs are first put into the contingent bench account and from that charged up to monthly bench repairs. The operating expense account shows what the bench repairs were. If we were to take out this old springer set and put in a new water gas set we would charge the new one up to construction and credit the plant with whatever we could get out of

the springer set. We have nothing in the nature of a replacement account in the books. The first mains were laid in Lincoln in, I think, 1872. No one of them are now in use that I know of because they were wooden mains. I think they were just allowed to rot in the ground and never were taken out. I don't know
68 when the first iron mains were put in. It is further back than I can remember. The new coal gas benches were built in 1890 or 1891. I can't tell how many times those arches have been rebuilt, or how many times those benches have been re-filled, but we re-built the arches and re-filled the benches this last year. That was charged to contingent bench repairs and we spread it over a period in the operating expense that we think the benches will last. The three south benches were put in in 1901. The Fort Wayne water gas set was put in in 1901. That, of course, has been re-lined and repairs made on it right along. The meter that we have now was put in in 1890 or 1891. It has been repaired a couple of times and there is nothing but the shell of the original meter left. The 205,000 ft. gas holder was built in 1890 or 1891. They have got to have a new holder now as it is in bad shape. The boxes were built in 1890 or 1891 when we were re-building there and another one was put in in 1901. The coal gas exhauster was put in in 1891. We have changed engines on that a couple of times and of course kept up the repairs on it. There was a coal gas meter put in in 1890 or 1891. That has been repaired a number of times and fixed over here in the last year. That was charged to repairs. The new plant was constructed when the location was moved in 1890 and 1891. Some of the scrubbers we now have were put in new then. It is my impression that they were put in in 1901 or 1902. Some of the cast iron main lasts very long, and some of it does not. It depends on the ground it is in and the conditions. I do not know what the average life of a cast iron main is or a wrought iron main. I do not recall any places where we have to take it up frequently.

Redirect examination by Mr. Rose:

In 1904 we borrowed some money on stock options at 6%. In addition to the stock option pledged we had to pledge a double amount of bonds. The stock option is to purchase the stock at the rate of $10 a share. The par value was $100. I don't know
69 who furnished the stock to meet that option. I understand a holding committee held that stock but I don't know absolutely. Those notes matured the first of June or the first of February, 1906. The notes were surrendered and instead of paying money for them the company issued $100,000 worth of stock and realized that much for the stock. That $100,000 was not added to the assets of the company or to the capital. There was no account made of it but it was put into the company and the assets were increased by this $100,000. The company never paid anything out for it except its capital stock. I have not included that in my estimate of valuation here. None of this went into the electric department. The whole $100,000 went together. That is the statement

of the construction, the way I was able to take it out from the old books, and the new books which I know are absolutely right, but on the old books there were different bookkeepers and different systems and it was long before my time. We were behind about $40,000 on our bills, and taxes, at that time, and for some time prior we had been unable to maintain the plant and meet the interest on the bonded indebtedness and that was the emergency that required the contribution of $100,000 from stockholders. We were in dire distress for money and we couldn't borrow it.

Recross-examination by Mr. Stewart:

We are compelled to spend a good deal of money every year for extensions. We tried to take care of this even if our bills have to run behind but we don't always succeed. The time we were in distress for cash we were adding to the value of the plant by building extensions. There were some going in at that time, but you can see when we cut down on that by that table. The statement that I have given is the construction account the way I was able to get it off the books for those years and I want it understood that we got $100,000 of money outside of that that was paid into the company, but I would not say that that was paid out for construction in addition to what has been shown here.

70 Redirect examination by Mr. Rose:

I am not prepared to show that the figures I have given here include all that the company has expended in the equipment of its plant. I may be in error on some of these old things. There were different bookkeepers and they had a different system of keeping books and I wouldn't say that this was absolutely sure. I would say that I have found all that was expended, to my best knowledge and belief, and that that was all that I could find, but I may have missed something.

Recross-examination by Mr. Stewart:

The oil that we use in the manufacture of gas comes from the Sugar Creek refinery in Kansas. We pay 4.2¢ per gallon for it, F. O. B. cars, Lincoln. The contract a year ago was 4.1¢ but the price fluctuates according to whether they want to boost it or not. It is not crude oil but what they call gas oil. I am unable to give you the average life of the iron main and I don't know the average life of a service pipe. I have no data on that. We have had cases here in Lincoln where we have had to partially replace service pipes—places where they would go through a certain strata of earth and we found that they gave out frequently. We had to take them up and put others in their place. I don't know of any case where we have had to replace every foot of any service pipe at one time. When we put a repair of that kind in the service pipe or replace part of it it is charged to street maintenance and distribution expense which is a part of the general operating expense. The three

recuperative benches of 6's complete with economizer referred to in the inventory of the property were started in February, 1907. Everything except the foundation was new at that time. The 3½ depth benches without economizer were originally installed in 1901 or 1902, and filled in 1904. The one No. 6 Root's coal gas exhauster with engine was installed in 1890 or 1891, and the Bristol recording gauge I think was put in in 1904 or 1905. That is used to
71 show the vacuum on the exhauster and is attached to it. The No. 3 E. & A. tar extractor with by-pass connections was installed when the plant was built in 1890 or 1891. The tower scrubber, 66 x 30 x 16 in., by-pass connections, was installed in 1902, and the water tube condenser, 54 x 25, with 16 in. by-pass connections was installed at the same time. The standard rotary scrubber and by-pass connections was put in in 1890 or 1891, and the coal gas meter, 5 x 5, with by-pass connections, was put in at the same time, as was also the one set of horizontal water-cooled condensers. The ammonia circulating pump and motor was put in within the last year or 18 months. It is a new one. The one Root's economizer, blower, engine, pipe system, gauges, etc., was installed in 1904. The 132 ft. of foul main from benches to purifiers was put in in 1890 or 1891. I am under the impression that three of the 25 x 21 x 5 purifying boxes with central seal carriages and connections were put in in 1890 or 1891, and the other one about ten years later. The 10 x 10 McDonald station meter was originally put in in 1890 or 1891, and the Hinman drum with by-pass connections was put on the meter this year. That is the inside workings of the meter and it costs about $2,500. I am not prepared to say now whether that went into the construction account or maintenance account. The 205,000 ft. two-lift gas holder was put in in 1890 or 1891. It will have to be replaced on account of its age. We have tried to keep it in repair but there may be a time when we will have to put it out of service. We will replace it as soon as we can raise the funds. We are trying to get them now. The brick tank for this holder was put in at the same time. The 20-inch Connelly street main governor and connections was installed in place in 1890 or 1891. The booster outfit and the motor with connections was installed in 1904. One of the four 6,000 gallon iron shell storage tanks for tar was put in when the plant was originally built, and the others as they needed them. There are six altogether.

72 The one gas calorimeter was installed about 1905. The one bar photometer was put in in 1901 or 1902. The Western Gas Construction Company water set complete with connections was put in in 1901 or 1902, and the operating floor for it was put in about the same time. The springer water gas set was put in in 1890 or 1891. The No. 10 Buffalo forge blower with piping was put in in 1904. The one 35 horsepower, 1004 H. P. M. D. C. motor and auto-starter was installed in 1904 or 1905, and the one 15 horsepower, 1200 H. P. M. reserve blower and motor was put in possibly in 1903 or 1904. We used to run that blower on the old set with steam and had a little steam engine to run it and then we

replaced it with this motor. The 50,000 cubic foot relief holder was installed in 1890. I don't know how much older it was but I think we had that holder over at the other plant and there was some work done on it when we put it up there. It is only in fair condition. The brick tank was installed at the time the plant was put up. The foul main from gas machine to the holder and from holder to the purifiers was put in about the same time, as was also the 12,500 gallon oil storage tank, and I think the 10,000 gallon oil storage tank was installed about that time also. Of the small items the oil pump and motor were put in in 1904 or 1905. The oil spray system and drilling apparatus was installed about 1904 I think. The one tar separator circulating system, two pumps and pipe connections was put in in 1906. The 150 horse power boiler erected is an estimate of what it would take to run our gas plant and what our boiler system amounts altogether. We changed boilers right along. We put one in a month or so ago. The present buildings were erected in 1890 or 1891, and then one of the buildings was extended for a scrubber and condenser, I think, in 1901. The material is brick and stone. Some have shingle roof and some have corrugated iron. They are in fairly good condition now with the exception of the coal house. That isn't in particularly good condition. I expect if we had time enough I could prepare
73 a detailed statement to show how long the various lines of main and service pipe have been in. I don't suppose we could go back much farther than 1901, though. It would be hard to get a record beyond that on account of the different systems of keeping it. It is made up, for instance, of different systems of bookkeeping during the different ownerships of the gas company.

When we put in a service we charge the amount we put into it to the construction account and credit construction back with the amount the consumer pays. On that we charge to construction the amount we actually put in from the main to the lot line and the consumer pays from the lot line into his house and for making the connection. When we install meters the consumer don't have to pay for that. We furnish that. We put the pipe connections to a new range the first time without cost. After that we charge the consumer for moving it or connecting it up. If he has an old range we charge him for connecting it up. When we make a connection for light the consumer is supposed to drop the riser down to where the meter goes in and we make the connection without charge. Our books show what the connections for meters and ranges cost us. The setting of a meter costs about a dollar. That means just connecting to the service pipe or riser. I can't tell you exactly about the range connections but they run in the neighborhood of $3. Our books will show that. We aim to keep not less than 2,500 or 3,000 tons of coal on hand. We probably have more than that now. If we have 3,000 tons on hand we think we are pretty short and we aim to keep more than that on hand. Any profit that we make on the gas range with which we supply our customers is credited up to the expense of range sales. The footing of items A to G on page 15 of Exhibit D under the head of

analysis of special expense accounts should be $12,920.42 instead of $1,292.42. They have made a mistake and left off one cipher. It is a clerical error and does not affect the general balances. The correct of this is carried on the same page under the heading 1507, promoting new business which is intended to represent this footing.

74

Our inability to negotiate loans and secure money for the company was caused by the constant pounding and turmoil that the company has been under here and this affected the market. I started out in December to get this first money and money was easy at that time. We had a number of other people who tried to float this loan in addition to my efforts. It was not due to the fact that money was not to be had on the market. It was due to other causes. I don't think the amount of bonds we had out made any difference. If we had had no incumbrances on this property I still think they would have been unable to borrow the $100,000 with the local conditions the way they were at that time. That is only a surmise, however. Our items of expense for the manufacture of gas barring the cost of material compare very favorably with other companies. We could not begin to compare with a town like Chicago if their cost of manufacturing is 25¢ per thousand because of the difference in the number of consumers, the cheap price of material, and their probably running their plant on a mechanical basis. They can afford to have mechanical stokers and charging machinery and then we must consider also the amount of their output. The amount of output would make some difference in the cost of manufacture. A dollar more per ton for the coal would make the gas cost, roughly estimated, 10¢ per thousand more. If oil was a cent a gallon more the gas would cost us about 3.9¢ to 4¢ a thousand more.

Redirect examination by Mr. Rose:

The large holder had had repairs on it. It has to be repaired to keep up its efficiency and avoid the extravagent waste by leakage. We are making some repairs right along and it is necessary to scrape and paint the holder once a year. Notwithstanding all of that, in my judgment, that holder has practically reached the stage where it is necessary to replace it out of the fund which I estimate for depreciation. The mantles have done a great deal to bring gas lighting up to the efficiency and conforts of electricity for domestic lighting. The form of the inverted mantle principally makes it look more like electricity. I think that with these modern devices gas lighting in modern homes is as confortable and efficient as electric lighting. We have to sell gas to the man who uses it for light and fuel at the same price—$1.20 per thousand. The Traction Company is ambitious and they can send out their solicitors and make that man any rate they want to. When they get him we have an investment there with our revenue decreased. The house is piped but the man don't use the gas and we have lost a part of the revenue but we still have our

75

investment there. There are considerable districts in the city where our gas meters are in the same house with the electric meter of the Lincoln Traction Company. They are in the south portion, and in the south-east portion and later in the north-east portion. They are down in the business district, too. Most of the good residences have combination fixtures which permit the use of either gas or electricity for lighting, and in that case the company that would make the lowest rate would get the business. If you are compelled to keep a stationary rate you can't get it and the competing company selling electricity is not bound by any arbitrary ordinance rates of the city.

Recross-examination by Mr. Stewart:

I don't know that we have been scraping and painting our holder quite as often as once a year but when we have done it it has been charged to expense. It is an iron and steel boiler and that is the material that they make them of at the present day. It deteriorates by being eaten out. It is exposed to the weather all the time. It would eat out even though it was kept painted. It is down in the water, then it is up in the dry. Then in the cup there is a water seal and it fluctuates up and down, wet part of the time and dry part of the time.

76 HOMER HONEYWELL, recalled for further examination, testified on behalf of the complainant as follows, pages 173 to 179, printed transcript:

Direct examination by Mr. Rose:

In 1899, up to October 1st, we had in effect a rate of $1.80 net for illuminating gas and $1.35 net for fuel gas. On the 1st of October of that year we started to reduce our illuminating price 7½¢ per thousand until the light and fuel rate was the same. Then when Mr. Van Riper came he made a rate of $1.75 gross for light and $1.50 gross for fuel gas, with a discount of 25¢ per thousand for prompt payment which made the rate $1.50 net for light and $1.25 net for fuel and that ran along until June, 1904, when we reduced the price of both kinds to $1.50 per thousand gross with a discount of 30¢ for prompt payment which made both rates $1.20 net, and we also agreed to remove one meter and supply the gas all through a single meter. There was no time intervening when the price of fuel and illuminating gas was all metered by one meter and the rate was $1.25 net for both.

Cross-examination by Mr. Stewart:

The increase per capita consumption under the reduction of these rates for these years could be figured out but I don't know what it is. I would not say that it had increased greatly but I don't know. Our books show that the reductions reduced the revenues. The gross receipts have increased constantly on account of putting on more customers. 1905 showed a decrease in the gross receipts over 1904. That was the time of the last reduction. You can charge a price so

high that the consumers won't use the gas, but I don't think that has been the case with a good many gas companies. I would not say that it has not been but I know of no place where the charge was so high that the people did not use it. It was something else that caused it. I would not say that the reduction in price has always had the effect of increasing the output and consumption. If you hadn't gone out after the business or if you went out as you
77 had the year before you would get some natural increase anyhow. Barring that natural increase you would reduce your revenue by a reduction. If you go after the business and put in more energy to get the business that you had the year previous to reducing the rate so that the amount of energy in both cases is equal, the increase in the amount of consumption is due to your effort and not to the reduction in price. I believe I could find other experienced gas man who would agree with me.

Redirect examination by Mr. Rose:

In the face of a reduction in price the only means that the company has to maintain its net revenue is to hustle for new business. It cannot over-come the decrease in net revenue by any other means. At the time the decreases in price went into effect we started up a new business department in an endeavor to maintain the revenue. In 1901 we employed from two to four men. In 1904 we started out with a new-business department with six solicitors and with a man at the head and a clerk. They made a house to house canvass to ascertain what the consumers had on the premises, what they used, why they didn't use something else, and trying to get in additional equipment. They went to every house in town and kept a card record of it. The town was divided into territory or districts and each man knew how many people used only a range or light or both. We maintained a school and educated our solicitors and got reports from them daily and there was considerable expense involved in that. For a while we had them solicit on commission. We pay them on a salary and commission basis now. We have gotten a business worked up in this territory pretty well up to what can be done with the method of charging in vogue and which we have to follow. We have not been able to reach the industrial field on account of the flat rate meter charges.

Cross-examination by Mr. Stewart:

If we could reduce the charges to each consumer on a
78 rational method we could get a great deal of patronage we don't get now on the present system. By that I mean confining the expenses for different classes of consumers and not arbitrarily taking a flat rate per thousand feet. If we were to do business on that method and make a fair profit we would have to charge considerable more than an average of $1 per thousand feet. We would have to do that until the business was worked up. The present rate is a voluntary rate and there is no ordinance requiring us to charge a flat rate except the dollar gas ordinance involved in this suit. The

ordinance of 1899 allowed us to charge $1.35 net for fuel and a sliding scale on the light until they both got the same. The company voluntarily reduced that rate to $1.20 for both fuel and light, and kept under the ordinance all the time. For a while we didn't make good the loss occasioned by these reductions but we pushed the business until now it is growing and ultimately we got enough business to make up for the difference in loss in dollars and cents. This system of pushing the business is an up-to-date system and one that progressive and well-managed companies ought to use if they want to make the best out of their business. Everything else being equal the greater the volume of business the lesser rate required to maintain the net earnings and that is the reason we pushed for more business. After a reduction in the rate of ten or fifteen cents on any given amount you could increase the business enough to make — for the loss of revenue if you could get enough business but the question is, Where are you going to get it?

Redirect examination by Mr. Rose:

It is out of the question under the dollar rate to make up the shrinkage due to the loss. There would be no way, in my opinion, of maintaining the revenues up to the standard necessary to maintain the plant after a reduction to $1 in this city. That reduction would give just one-sixth more unprofitable consumers and make them just that much more unprofitable.

79 You take away also the one-sixth from the profitable consumers. It isn't enough that you would gain to make the difference because it isn't enough even then to get the industrial business. It is too much for the man to pay that wants the gas. It would not do to give the actual cost of the service to the small consumer. They are unprofitable.

Recross-examination by Mr. Stewart:

The result of such a reduction could be better told by trying it, of course, than by speculating on it. There are a great many companies furnishing gas at a dollar but it probably don't cost them as much to make it on account of the materials and local conditions. The materials in Des Moines or Sioux City would cost less than they do in Lincoln. I don't know anything about the price of oil at Sioux City. I don't believe we can get the gas coal as cheap as they do. Our price is $5.52. If they pay substantially the same for coal and oil the distribution would still have something to do with the cost. There might be more miles of mains. I think Sioux City has more consumers than we have.

HOMER HONEYWELL, recalled for further cross-examination, testified on behalf of the complainant as follows, pages 249 to 268, printed record.

Cross-examination by Mr. Stewart:

Exhibit 100 is a correct statement of the mains and services laid from 1902 to 1907, inclusive as far as I have been able to determine.

It was taken from the books and records of the company. Exhibit 100 offered and received in evidence.

This statement was taken off from the yearly reports as far back as 1902. I did not go back any farther. I did not spend very much time getting it up. I took the yearly reports and did not compare the statement. I think it is a full and true exhibit of what was done by the company with the exception of 1902. I have not got the number of feet for that year. Some of these reports are
80 in evidence. We have the report for the first six months of 1907. Exhibit 101 is the yearly report for the full twelve months of the year 1907, and is found from pages 9 to 27, inclusive. Exhibit 101 offered and received in evidence.

On page 10 of Exhibit 101 the item of bench repairs is $4,022.24, while for the previous year it was $1,976. The increase is because we were re-building some arches in the latter part of 1906 and started to use these benches in the fore-part of 1907. We re-built from the foundation three benches of 6's. They were built in the fall of 1906 and we started to use them in the latter part of December, 1906, or the first part of January, 1907. The total cost was about $6,600, and there was included in that the cost of iron work and retorts themselves. The hydraulic main, and another piece of hydraulic main, and everything that would go with the bench was also included. There might have been as much as $13,000 or $14,000 in the contingent bench repairs account. In charging off the cost of re-building these benches I would not charge it all up to one year. I aim to spread it over the period of the estimated life of the benches. I thought these new benches ought to last four years. If I remember rightly we thought they ought to last longer than the ordinary bench, and we aimed to spread the charge over that period. I cannot tell whether it was so entered on the books or not without looking them up. I do not remember. Every time you re-build a bench set you have got to have some new iron work—not all of it but some of it. I would hate to guess how long the iron work would last. The first iron work was put in there in 1890 and it was all new work in 1906. I don't remember whether there was a flat contract for the whole thing or whether the iron work was separate. The party who built the benches bought the iron. The life of a retort is about three years. The arches have a life of probably 6 or 7 years, something like that. You can probably put two fillings in. When we re-built an arch we used some of the material that was there and put it back in the arch.
81 The entry of repairs can be found in the accounts payable or general ledger. The entire account of reconstruction of these three benches has not been charged to operating expenses. We put it into a special account and aim to charge up so much for the manufacture of bench renewals, and it is charged over the estimated life of the benches. No part of it is charged to construction and it is all taken in time from the operating expenses. That has been the policy of the company except where we built new benches where there aren't any before. That would be charged to construction and would be an addition to the property. The general ledger for 1906 or 1907 would show how much has been charged

up to this time to operating expenses and the amount still left to be charged. The difference between the entries on page 25 of Exhibit C, being the report for the year ending December 31, 1906, on coke stock, the entry on the first line being coke on hand average value $18.60, and in the next line coke received during the month valued at $4.77 per ton is because the coke stock was short and the average price per ton went up. We charged more into the coke stock than what we put in there. It was an error in not charging it up. For instance, we have charged up so many tons of coke and we come to measure our pile and found that we did not have that much in coke and they ran the price up per ton. At the close of the year, on line 2327 it is invoiced at $9.87 per ton while during the year it is entered at a much lower figure. This is because we have evidently made some profit on our coke and have put the coke in there at about the highest figure and it brought the average price down. The $5.39 appearing in line 2324 for coke used during the year is the coke and the handling and expense that went in there. It does not have any reference to the market value of the coke. We credit coke in the pile at a certain figure and charge it to ourselves at the same figure plus expenses. The figure at which we charge it into the pile is more or less arbitrary. Last winter we got as high as $8.50 per ton delivered for the coke. That
82 was higher than it commonly runs. Ordinarily it is $7.50 or $8, and of course then there is another price for dealers at the yard. The cost of coke delivered up town varies depending on whether our men deliver or whether we get lodged and have to have some of the transfer people do the work. Where we have a transfer man it costs $1.50 per ton. Where we deliver ourselves I suppose it runs in the neighborhood of $1. The regular price is 50¢ per ton for delivery here in the city, but they are all well equipped for it. We don't hire a man by the month and they can get all the men they want evidently. When business is rushing they don't have to go to somebody that makes a specialty of hauling other stuff. I know no reason why it should cost twice as much to deliver coke as for coal but it does. Our books will show what we pay to outside people and also what it costs to deliver by our own team. On the tar stock we fix as high a price as we think we can get out of it. We don't sell very much. There has not been any demand or market for it lately. We get from the customers, ordinarily, $5 a bbl. including the barrel. The barrel holds about 50 or 53 gallons. The barrel itself is worth from $1 to $1.25. The surplus that we do not sell off we burn under our boilers as fuel to make steam. We put it in there at about the same heat value that we would put on steam coal. The tar is sold to the electric department and that department sells steam to the gas department. The electric department is the largest consumer of steam. If I did not say that in my former testimony I meant to.

Redirect examination by Mr. Rose:

Coke has greater bulk than coal and requires more room to store

in a wagon and a larger wagon and it requires more shoveling and more handling per ton. That in itself increases the cost of hauling.

83 Recross-examination by Mr. Stewart:

In 1905 the tar used was charged at 3.45¢ per gallon; in 1906 it was charged at 2¢ per gallon. There was not that much difference in the value of the tar as a steam making product in those years but I think there was some better market in 1905 than afterwards and we credited up our residuals at a higher figure than we had and reduced the credit of our residuals, and its value as a steam making product did not control it altogether. I don't remember that we used very much tar in 1905 for steam making purposes. We made more tar in 1906 than we did in 1905. In 1907 there were only 57,413 gallons made, while we sold 21,175 gallons, and used 93,553 gallons, a total of 114,738 gallons. The difference is due to probably what we had in the stock. We had everything stocked up, no doubt, and a big lot of tar on hand. Our accounts are made up partly on estimates. Those for residuals have to be partly estimated. In 1907 we made 9 gallons of tar per ton of coal carbonized. In 1906 and 1907 the value of the tar and residuals was deducted at the same figure. In 1906 we carbonized 7,579.75 tons of coal and at 9 gallons per ton that would make about 68,000 gallons of tar. We credit manufacturing that year with 68,848.1 gallons at 2¢ per gallon. We sold 21,000 gallons at 7.73¢ per gallon. We didn't credit it up to manufacturing at what we got for it because there is some expense in that, the handling and one thing and another. And those expenses are not included in the 2¢, but they are added up some place. Previous to possibly 1904 or 1905, somewhere along there, tar commenced to stock up and we had a lot of it and had to barrel it. We were crediting residuals at a high price, 5¢ a gallon, which was too high. We could not get that much out of it and we had to reduce that price which we had and we thought we would have to burn tar on the same basis as steam coal and we credited residuals up with what we thought it was worth to us, what we could get out of it in some way, shape, or manner.

84 Redirect examination by Mr. Rose:

I think 1905 was the first year we ever tried bur-ing tar. Prior to that there had been a market here for tar. Since then the market has been very slow. Prior to that time we stored some of the tar and sold some of it, and they made tar rope, and tar walks, and such things as that out of it, and tar roofing. When our capacity for storage was filled to over-flowing some of it ran away. I think some of it this last year ran away into the lake back of the west barrel. We have credited to the gas department all of the tar residuals that it is fairly entitled to have. In actual practice we found that we had been making excessive deductions from the manufacturing cost of the gas on account of the tar. We were crediting it at 5¢ and we had to change that to 2¢. We could not get 5¢ a

gallon for it, and in order to compensate for the excess credit we reduced the credit for the next year. When we sold tar it was at a higher rate than we had credited it to the manufacturing cost. That item is so distributed that the gas department gets the ultimate credit for what we actually got out of it. The tar stock would get credit for the profit and it would naturally reduce the price per gallon. During the year 1905 and early part of 1906 when we fixed the price at 2¢ per gallon we did not have any controversy with the city over rates. Our only motive in making that credit on account of the cost of the gas was to make an honest distribution between the gas department and the electric departments. It was not made with reference to any public exhibition or anything of that sort. The books and reports are in the same condition that they were at any time before this controversy arose. In my opinion, the adjustment and accounting between the two departments of gas and electric as shown on the books and reports is just and fair. We tried to keep in touch with the management of gas plants generally over the country and I associated with managers and met with them regularly. The tar account has been a
85 matter of worry to all managers and they have all wondered what to do with their tar. Previous to a couple of years ago there were no very satisfactory burners and they could not burn their tar. They tried to make it into tar paper and manufacture it into the paint and things of that kind. The biggest handlers of tar in the country are the Barrett Manufacturing Company. They send out a slip to every gas company the first of the year asking how much tar they have on hand, how much the estimated make is, and they have all of that data down pat. These people handle the coal tar product of the country. In 1906 or 1907 we got a bid from them of 2¢ a gallon for the tar laid down in St. Paul, Minn. There is no other market in the country for the quantity we handle here other than 2¢ a gallon. What we make over and above that is due to our skill in handling and by selling it in small lots to farmers. In former years there was a higher price than there is now. We sold a lot of tar to a local man here and sell to him yet. We could get more than 2¢ but we have not been able to in the last two years.

Recross-examination by Mr. Stewart:

The Barrett Manufacturing Company have offices scattered over the country. They have got one in Omaha. I think Chicago is their main office. In the coke account on page 25 of Exhibit 101 the value of the coke received or made during the year is shown to be $17,580.92. It is credited up as a residual as $20,537.73. Those figures come from 4,143.82 tons of coke at $5 a ton and 443.63 tons of breeze at $1. That does not figure out. There is a difference of about five or six hundred dollars. There were 7,098.57 tons of coal carbonized that year and it yielded 1,250 lbs. per ton of coal carbonized. That includes the breeze. 2,698.18 tons of this is charged to the water gas department at $5 a ton and we sold

and used 64,064.82 tons of coke and 626.25 tons of breeze. To tell how much was sold you would have to take the difference between what was used in the water house and water gas and make a subtraction. If we sold a thousand tons of coke at $8 and it cost
$1 a ton to deliver leaving us net $7 we would still credit
86 the coke as a residual at $5 a ton. There is some other
expense in there but we aim to credit it up at what it is worth. If we found out we could get $7 for it we would credit it up with that and charge ourselves with $7 for whatever we used. The value of the coke used does not, I would say, affect in any way the earnings of the gas department as a whole. We use breeze in the electric department but not any coke. We aim to charge the same price that we credit it up for so that it would not have any effect on the earnings of the gas department. The price of the tar disposed of to the electric department would affect the earnings of the gas department just as the price we sold gas at and the cash received from such sales would affect those earnings, and we aim to get just as high a price for our coke as possible in order to reduce the manufacturing cost. If we can make a big profit on our coke we would gradually raise up the price that we credited the residuals at so that a boom in the coke market or more money in the coke market would affect our manufacturing cost. The profit over and above the price credited is also credited later when we make the profit. If we credited as residual what we receive for the coke sold and made no charge against the water gas department for the coke used we would get the entire benefit of the residual in arriving at the cost of the mixed gas but the gas would not be in proportion. It would not be correct bookkeeping. Now we can tell just what our water gas costs are, separate and distinct from the coal gas. The only object in charging the water gas department with this coke is to ascertain what it actually costs us and in that way it increases the water gas cost and decreases the coal gas cost so that we are able to get a comparison of the costs of the two kinds of gas. It does not affect our earnings at all. In Exhibit 101, the item in line 2323, Expense of Coke, $2,902.13, comes from delivering, advertising, and everything connected with the coke expense, and it
87 would be added to the residual account. The item of coke
expense has neither been added nor deducted from the item on page 10 of Exhibit 101, coke residual, $20,537.73. That coke expense refers directly to the coke stock and not to the residual. It does not appear in the cost of the gas at all. It is a coke expense and not a gas expense.

Redirect examination by Mr. Rose:

The sales of the residuals of tar, coke, and breeze, are all credited properly and distributed to some account so that ultimately in the general distribution the proper accounts get credited, and in the final results it really makes no difference in the price of charging up the residual stock in advance of realizing anything on it. These things all compensate and clear up in the final account, and there is no credit lost. If you credit your residual at too low a figure as soon

as you find it out you credit them at a high figure. If you credit them too high you reduce the credit. The same thing occurs if you find the stock is credited for more than you have there. That has to be adjusted from the actual expense of handling it. There is no way that you can tell absolutely what you will realize from these residuals except by actual experience. There is no other way to keep an actual cost as near to what it is as is possible than to fix in entering the credit for the stock on hand and in advance of its disposition and sale than to fix in a measure an arbitrary credit for it. For instance, we have no coke market now in the summer time. If nobody gets any coal here in the summer we will boost the price of our coke. We are the fellows that have got the coke and we will boost the price and get the credit for it. We have to advertise in the newspapers and otherwise in order to get a market for our coke. If we did not advertise the consumers would naturally go to the coal dealers engaged in that line of business. There is no way that we can get to the market except by advertising and soliciting.

88 Recross-examination by Mr. Stewart:

The cost of advertising to sell coke is put in under coke stock expense. I do not know how much advertising we did in 1907. I don't know whether or not there is any advertising there. We do not carry the advertising all in one account. I can point on the books where these credits are properly allowed. It would make a difference in the costs of the mixed gas if we were to credit all the coke at $7 a ton instead of $5. It would lower the price of coal gas and increase the cost of the water gas but not in an equal proportion because we do not use all the coal in the water gas that is made. Some of it goes into stock. If we used the same amount in the water gas as we did in the coal gas it would not cut any figure. If we were to credit all the coke at $7 a ton it would reduce the cost of the manufacture of mixed gas but it would be only temporarily. When we finally sold the stock out and distributed the items of loss over what we had credited, it would finally work out right at the end and it would not make any difference in the final result, if we did not get $7 for the coke. We have to take account of the sales in actual practice, and in the final accounting it would work out just according to the experience in either case, and the only way to keep an accurate estimate in advance is to credit it up at what our usual experience indicates we would get out of the residual. If we sold half of our coke at $7 net a ton and used half in making water gas which had been credited up at $5 we would credit the residual with $7 and charge up what we used at $7. I do not believe we can show any profit in the coke. There is the expense and there is the price per ton and there is the stock at the close of the month. It is worth $5.49 and we have credited it up at $5, so we are pretty close. We started that account in at $9.87 a ton. That is what it cost us—handling and shortage and advertising. If we only get $5 from that we would not take that $4 away from the residual. We started with $5 as a basis. That is

what is credited up. I cannot show you anywhere in either
89 of these reports where there has been a loss charged to the residual account or gain credited because when we had a loss we tried to even it up in the coke stock itself without going back and changing the manufacturing report. The gross sum is credited in the coke stock *stock* account and is carried from year to year.

Q. But that doesn't really then give you any index as to what, if you segregate a single year of the gas business your coke account would not then fairly indicate what your residuals had been worth for that particular year for the reason that you have been carrying the gains and losses in your coke account, is that true?

A. Very nearly so; not absolutely correct; you have got to take some leeway, you cannot tell what your coke is going to be worth in the fall; we cannot tell what it is going to be worth this fall that *that* we are making now.

If we sold half of our coke in 1907 for $8.50 and used the balance in making water gas it would not be a fair showing for that year to simply deduct as a residual $5 a ton if the expense of delivering the coke would not equal the difference between $5 and $8.50. The way to get the correct value of the coke residual for 1907 would be to take the number of tons of coke sold, deduct from it the expense of handling and selling, and deduct that from the cost of the mixed gas. We could not wait until the end of the year to give the manufacturing department credit for the residual if we wanted to know what the cost was. If you had a good market your costs might be low, but if not they might be high. If we wait until the end of the year and after deducting the expense of handling and advertising and disposing of the coke after the sum that was left should be deducted from the total cost of the mixed gas, that would leave the net cost of the mixed gas.

HOMER HONEYWELL, recalled for further cross-examination, testified on behalf of the complainant as follows, pages 328 to 332, printed record:

Cross-examination by Mr. Stewart:

90 I have not looked up and ascertained what the item of 50¢ per ton for handling the coal consists of. I have not looked up the items of the coke expense.

Redirect examination by Mr. Rose:

In actual experience we have been obliged to pay higher than the schedule price of the coal in those contracts, at times as much as a dollar or more, in order to get our supply of coal. The cost of coal has been necessarily affected by the strikes and lock-outs in the coal producing districts. It has also been affected by the car shortage. We have failed, in the fall when grain is moving eastward, to get coal here, and we are not able at times to anticipate that. We aim to keep a supply on hand but you can not always do that. I have been down as low as one day's supply at the plant, and in actual operation

it is necessary at certain seasons of the year to keep a very large supply of stock on hand.

Recross-examination by Mr. Stewart:

I remember when Van Ness was here in 1906 he spent as high as $7.50 per ton for coal. It was the only thing we could get. We had to use Kannaw-a coal at considerable increased cost,—a poor kind of coal. That was early in the fall; we had to use a lot of it. I do not remember how many car-loads. That could be ascertained and determined from the vouchers.

Redirect examination by Mr. Rose:

The actual cost of the fuel is correctly stated in our report, and embraces the actual experience in the work of administering the affairs of the company.

Recross-examination by Mr. Stewart:

I do not remember whether or not there was any high priced coal used in 1905. I don't think we used any in 1907, but in 1906 we used some of the high priced coal. I do not remember what the price was. The provision in Exhibit 114 for furnishing gas
91 oil at 27/34 oil means 27/34 oil gravity. We do not want too heavy an oil and we would want a fairly light grade but not too light. 26 to 30 is usually called gas oil. I do not know how they get the high specific gravity in oil. They take kerosene, gasolene, and bensene out of the oil before it is suitable for use in making gas. They do that by some process of distillation. Crude oil would not be suitable to our purposes. They do use it but do not get as good results as they do from gas oil. There is quite a difference between the ordinary fuel oil and gas oil. I do not know what the difference is but the price quoted would convince you. I have no quotations on fuel oil. The legal expenses for 1906 and 1907 are very much higher because Stewart and Munger got a settlement against us for $1,500 in 1906 and personal injury suits are entered up as legal expenses. In 1907 we had some expenses on the suit.

Redirect examination by Mr. Rose:

In 1905 where the record shows a low average for coal I remember that we were using some low priced Kansas coal. The price started at $3.75 or something like that at the fore-part of the year and along toward summer the price was boosted, and it is also very rich in sulphur and needed purification. We had to use lime purification to take it out. We discontinued it as it was expensive, and there were complaints of odor at the faucets when it was used. It is not practicable to use this Kansas coal with our machinery and equipment and it is not low priced now. We have found it impracticable by actual experience. It is harmful to the machinery and equipment. It is very rich in sulphur and is poor stuff to use in the water gas set. The sulphur is carried over in it. You cannot get it out unless you have lime purification. It is no good for any practical purpose.

Recross-examination by Mr. Stewart:

Even tho the price is low it would not save us any money. The purification would run up so as to more than eat up the differ-
92 ence. I do not remember whether or not we had a contract. I am positive that we did not get any of that coal after February 1, 1905.

HOMER HONEYWELL, recalled for further cross-examination, testified on behalf of the complainant as follows, pages 340 to 341, printed record:

Cross-examination by Mr. Stewart:

Exhibit 129 is the itemized construction statement which Mr. Stewart asked me to prepare. It is taken from the books of the company. It is the itemized statement of Exhibit E.

Exhibit 129 offered and received in evidence.

Direct examination by Mr. Rose:

I do not have absolute and accurate data back as far as this construction runs. There is no way that I can check with absolute definiteness the cost to the company of the properties originally acquired and built, because there are so many different ways of keeping books. I do not know that this is fully adequate. I testified before that it was correct to the best of my knowledge and belief and would not swear whether it was correct or not. I do not vouch absolutely for its correctness. It may be too small or it may be a little too large.

HOMER HONEYWELL, recalled for further cross-examination, testified on behalf of the complainant as follows, pages 464 to 465, printed record:

Cross-examination by Mr. Stewart:

If I remember correctly there are $796,600 in bonds of the Lincoln Gas & Electric Light Co. now outstanding. Those are just the bonds. It does not include any bonds that are out as security for notes or any bonds issued by any other company, and does not include the $333,000 of the old Lincoln Gas & Electric Co. These bonds were issued from time to time. I do not remember how many were originally issued at the time the company was organized. I know nothing about the facts entered on page 11 of Exhibit 151 reciting that
93 the Lincoln Gas & Electric Light Co. purchased the property of the Lincoln Gas & Electric Company, and assumed and agreed to pay $655,000 par value of the Lincoln Gas & Electric Company's first consolidated mortgage 5% bonds issued under the company's mortgage of July 10, 1900. I know how many bonds are out now because I pay bond interest on them. The coupons are returning to me. I also have the book in my possession showing the issuance of bonds. If I had the ledger here I could tell you when they were issued. The item of $2,500 in March, 1907, in putting a Hinman drum in the station meter was a repair item and charged to

operating expense. That drum would last probably 15 or 16, possibly 20, years.

94 HARRY WARNER, being first duly sworn testified on behalf of the plaintiff as follows: Pages 170 to 173 printed record.

Direct examination by Mr. Rose:

I am Secretary and Treasurer of the Lincoln Gas & Electric Light Company and have been since December 24, 1906. I have direct charge of the different departments of the accounting department. The reports that have been offered in evidence, of the accounting department, have been made in whole or in part under my supervision. I have had additional experience in book keeping and we tried to make these reports from the books of the company correct, and to the best of my knowledge and belief, the entries from the books of the company made under the various administrations, show correctly the character of the transaction and history of the company, and Exhibit C and Exhibit D are correct summaries of the transactions reported therein. The classification of consumers as to the amounts of gas used, was made by the different men in the office and book keepers took the information from their books under my direction, and to the best of my information and knowledge the information compiled in this classification is correct. I am familiar with this classification which was produced by Mr. Honeywell. Exhibits C and D were prepared directly from the books of the company. Reports of this character showing these summaries are made each month and in addition a similar report is made each six months and yearly, and they represent the actual conditions of the company and were not made with any special reference to this law suit. They are in the same form they would have been made had there been no law suit or controversy.

95 Cross-examination by Mr. Stewart:

The item in Exhibit C appearing under line 1004 $22,566.96 was the value of the coke and breeze residu-m. It is a credit to the manufacturing expense and it is deducted from the total of the first three lines and on line 1009 the result $24,476.69 is shown, which is the net cost of the coal gas manufacturing material. On page 11 under line 1017 "General Supervision" $1,857.98 is shown the amount that was actually paid that month for supervision. The details of that item is not in this book. All of the items shown here for plant expenses were the actual expenses and money paid out for these items. Taxes are paid up each year and then apportioned so much each month, but of course an item like supervision, we know what that costs each month. I practically made this report myself from the books of the original entry. The oil account is not shown in this report because there is no place there for it, but I show the total amount used.

96 F. W. FRUEAUFF, being first duly sworn testified on behalf of the plaintiff as follows: Pages 201 to 235 printed record.

Direct examination by Mr. Rose:

I am second Vice President of the Lincoln Gas & Electric Light Company. My residence is in New York City. I am associated with Henry L. Doherty & Co. and our business is the owning and operating of electric and gas companies. I have been in the gas business a little over eight years largely in the accounting and financial department. I served first with the Denver Gas & Electric Company from its organization, first as Secretary and later as Vice President and general manager. I have been second Vice President of this company for the last two years and Vice President of the Pueblo Gas Co. and Lebanon Penn. Gas Company. My connection with this company has been advisory rather than supervisory. I make frequent visits to Lincoln and consult with Mr. Honeywell and always keep in touch with the business here through him.

I have been connected with the accounting department here and have made frequent examinations of the accounts and have acted as a sort of advisory financier. I am not a technical engineer. I am in touch with engineers everywhere, however, and consult with them in the drafting of the report which is now used. I have had something to do with the drafting of that form and worked with the engineers and accountants on it. I worked on them from the beginning to the end. I was one of the committee that made these up and I have assisted in compiling the printed rules for every item of expenses. I believe this system of accounting is the most complete in use by any gas or electric light company. We have compared it frequently with other companies. I have had a great deal to do with the making of contracts for the Denver company and have consulted with Mr. Honeywell about making contracts here and in other places. I have tried to keep posted on the price of machinery and supplies and to keep a complete record of what we are
97 paying for the supplies and different propositions. I have also tried to keep posted on the price of common and skilled labor. Whenever there is any change we are advised of it.

I have examined Exhibit 1 which has been produced in the hearing here. I have gone over the items of cost and expense to the best of my ability and have also offered it to other engineers and asked for criticisms on it. The figures shown in this Exhibit of replacement value of the company's manufacturing and distributing plant are practically correct. Exhibit A was prepared at my office in New York City. In coming out here and looking it over I discovered a mistake in one of the computations, not in the amount but in the computation. Since coming out here I have had it fixed and would like to withdraw it. I have the correct computation here and the corrected sheet. It is marked Exhibit A-1. These tables are an analysis of the business for the year 1906 showing the total number of consumers supplied and the amount of gas supplied to them separated in two classes, and apportioned against each is the amount of expense which each class should bear, and a deduction is drawn

from that showing the consumers who have paid a certain amount and the expenses necessary to secure that amount and the profit or loss secured from those consumers separated into classes. We first separate the consumers into classes and then the manufacturing cost to those consumers into classes. Then the distribution cost, the collection cost and the general cost, and then the total of the cost. Then we have apportioned the distribution costs occasioned by the consumers and then what we believed was a reasonable return on the fixed investment and profit, and then we have shown the actual returns and what rate we would have had on our money as the result of the operation for the year 1906. The mistake in the first table was in the general expenses through an error in the office. The general expenses were apportioned in this table on a per thousand basis, when they should have been divided among the consumers. In that way it has thrown out the balance of the computations and we will have to change the figures.

98 The classifications in Exhibit B are embodied in Exhibit A-1. Exhibit B verifies the primary extension that is carried out in Exhibit A-1, so far as the receipts are concerned. In this business we have three general classes of expenses. For expenses that are directly proportional to the amount of gas that is made, such as the amount of oil and coal used, the amount of the retort house repairs and expenses, that increases and decreases directly as the amount of gas made increases or decreases. Then we have expenses that are proportional to the number of consumers or meters in service, such expenses as the reading of the meters, the collection of accounts, the making out of bills, the repairs to the services and items of that sort, that increase or decrease as the number of consumers increase or decrease and these expenses are in no way effected by the amount of gas made or sold to these consumers. And then we have such fixed expenses as are occasioned by the demand and size of installation required to do the business, such fixed expenses as executive salaries taxes and fixed expenses of superintendence, etc. These are neither fixed by the amount of gas sold nor directly by the number of consumers supplied. They are proportioned by the demand made on the station. In making up this table I have separated those expenses which are proportional to the amount of gas made and charged, and charged that against the class of consumers who have used that quantity. We have apportioned those expenses that are apportioned to the number of consumers, to those consumers and putting these together we have the expense of supplying that group of consumers, and having the income from that same group of consumers I know whether or not that same group of consumers has been profitable or unprofitable. For instance, the first group represents those consumers who have used less than 1,000 cubic feet per year. In 1906 there were 101 of these. They were sold 64,400 cubic feet and they paid $72.48. The cost of supplying these consumers was $700.21 which makes a loss on these 101 consumers of $627.73 without allowing for

99 any interest on depreciation. Part of the depreciation and interest should be apportioned to the amount of investment

which those consumers require as consumers and the amount of investment they require as users of gas. I have worked that out and the additional sum which they require and the additional cost over and above the cost mentioned on those consumers is $334.95. The total amount lost on the consumers that use less than 1,000 feet of gas during the year, including interest and depreciation, amounts to $1,510.52 which is $14.96 per meter. This computation is correct. It conforms to the classifications used in our daily system of accounting and is taken from our monthly report. The table shows the same information for each class of consumers. The profit line does not come until after you have supplied 94 22/100% of the consumers at a loss. There were 6,110 consumers using 153,202,600 cubic feet and they paid $182,843.12. The cost of operation only was $127,432.44 making a profit from operation only of $56,410.68 or $9.229 per consumer. The cost, including interest and depreciation was $238,873.67 making a loss of $55,030.55 or a loss of $9.01 per consumer, after deducting interest and depreciation. The depreciation figured in this table is on a basis of 5% on replacement value of the physical property, not including real estate. It is figured on the sum of $622,000.00. This sum is exclusive of the value of real estate, cost of organization, franchises or the procuring of funds. It includes the working capital. The rate of interest used in this tabulation was 8% on a total investment of $1,000,000.00 which I regard as the fair value of the company's property including its good will, organization, franchises and physical property. I believe it a low estimate for the gas department.

I am also experienced in electrical works. Under the same circumstances I do not think the use of gas for lighting is attended with any greater risk to health or property than the use of electricity. To my knowledge there is no occupation tax imposed upon the gross receipts of any electric light companies, nor is there in this city
100 established in the electric light department any flat meter rate. The traction company competes with this company in the electric service. They have made most any kind of a rate and have done most anything to get the business regardless of conditions. There is no uniformity in their methods. Their competition in the electric business has taken away from us practically all of the desirable gas lighting business. They have made rates to the long hour users that made them prefer the electricity to gas. As a matter of fact we have been able to hold on to only the short hour business. The small consumers and the unprofitable ones stay on our books. On the present patronage, on a basis of a dollar rate, the gas department could not derive enough revenue to pay the actual operating expenses, and set aside enough for the real depreciation of the plant and returns on its money. At the rate of $1.20 collected in 1906 there was available after paying the operating expenses, the sum of $56,410.00 to apply on depreciation computed at 5% on $622,000.00 and to pay return on an investment of $1,000,000.00. After deducting the depreciation it left a return of 2½% on the $1,000,000.00 investment. The total cost per thousand feet in 1906 was 82 68/100 cents, the manufacturing cost was 47 89.100¢; the distribution cost

12 77/100¢ collection costs were 4 35/100¢; general expenses including taxes 76 67/100¢.

During the past few years the taxes have been increasing and also the standard quality of the gas has been increased which affects the cost of the manufacture. We are required to make 18 candle power gas with 625 heat units. We have been required to operate under that standard throughout the year and that has increased the cost. Prior to this standard there was no standard. We made what we believed to be a reasonable quality. The market on labor and materials has also been increasing and the price- of coal and oil have been advanced. The price of gas to the consumer has not been increased to make up for these increased burdens, but on the contrary it has been decreased. If we could sell, on an average of 40% more gas to our present consumers, we could sell gas at $1.00 per
101 thousand. If we had to increase our number of consumers and investment as our sales were increased we would almost have to double our sales to sell gas at $1.00.

I have some knowledge of financing gas companies of this character and am acquainted with the basis of earnings that are required by bond purchasers and brokers to place gas securities at par in the market. In a plant with the character here in Lincoln at this time, there would have to be an earning of 8% or 9% on bonds offered in the market in order to place its bonds on the market at par on the rate of 5% or 6%. Ordinarily they would have to show an earning of about 7%. In floating a 5% security or bond on the basis of $1,000,000.00 on a plant of this character, the company would have to show earnings of 10% or better on the same sum, because bond purchasers want to see that the earning power of the plant is sufficient to assure them of their interest and unless the earnings are double the rate of interest, they don't feel that they have that assurance. The earnings must be double the bond interest, because the depreciation must come out of that at some time in the future, so that when the time comes when they have to spend the depreciation fund and they haven't that fund and the property is destroyed, they want to know that the earnings are being set aside to create a sufficient fund to take care of the depreciation when it does come. The item of depreciation is a very important one and is taken into account by all operators of gas companies and determines the gas securities. The depreciation is a fund that must be accumulated, not alone to take care of the decay of the property, but also to take care of the inevitable inadequacy of the equipment. It is plain that our works are very close to the point of being inadequate and to get an additional amount of business we have to make additional investment to take care of the new business and we have to make provision for that future time or we couldn't earn our interest. The same way with the mains leading out of our works into the streets. They must be taken up and larger ones put in. They are largely worthless, whether they have been in a long time or a short
102 time. Then there is a third element. A portion of the equipment becomes obsolete. For example, the Springer Water Gas Set. It has been replaced by something up to date. A specific

example of inadequacy is in the case of our gas holder. We have taken a big chance in having a larger holder, because the demand or consumption being so great that we can not manufacture enough to keep a supply ahead. In one hour they draw out more than we can make. They are out of gas and we are out of service. When that holder was built, it was very much larger than was required. It will soon have to be replaced through decay and we will have to put in a much larger one. It is worn out through decay and through smallness also. There is no way that an engineer can figure to avoid displacement of material from this cause. If he figures too small he will be criticised at once for not having allowed sufficient capacity to do the present business. If he looks too far ahead he incurs an expense and interest that owners naturally object to. They don't want a greater dead investment.

In the western states it is hard for the engineer to know how big a town he has to provide for twenty years ahead. The best he can do is to make a reasonable estimate of the probable growth and as soon as you reach that point you have to enlarge again, always having something ahead of what they need. There is no known way of anticipating the demand upon any particular plant. From my experience I know that the items of depreciation must be allowed over and above the outlay for ordinary repairs and maintenance. The repairs and maintenance do not have any future. In setting aside for depreciation we endeavor to take care of the future. Repairs keep our equipment where it should be, while the depreciation is laying aside a sum for the future. In the actual business of the company here in Lincoln, the item of depreciation has not been charged to operation expenses. My honest belief is there should be something in excess of 6% on the physical investment for depreciation, but in making up our estimate here we put it in at 5%. In a growing town like Lincoln, I believe you must figure that our plant
103 from inadequacy has to be practically rebuilt and enlarged in not to exceed fifteen years from the date it was put in. A good part of the mains will not last to exceed fifteen years. I also understand that the soil here is not desirable for cast iron pipes.

At the present time there is no market for the company's 5% bonds. We have endeavored to market some of them still in the Treasury for the purpose of making improvements which we are now making and we couldn't get offers that we felt justified in selling for. They offered around 70 to 75 and it wouldn't warrant the company in selling at that price and rather than put out the securities at that price we offered the issuance of 7% notes, believing that possibly a little later on local conditions would be more favorable and money conditions might be more favorable when we could get them sold at a reasonable figure. We have been able to sell a part of these 7% notes at a discount but haven't been able to sell the balance of the notes secured by the bonds, two bonds being deposited for each note. 7½% to 8% is the lowest rate of interest any company can procure capital for an investment in an enterprise of this kind. In case the bonds are floated for 40 years or less, at the rate of 5% something better than 20% is ordinarily required to place the bonds

in procuring the money. A perpetual franchise in a town of this size is regarded of some value on the market. Unfortunately it is not customary at this time, any place in this country, to give perpetual franchises. A perpetual franchise in the city of Lincoln would have an earning power of $75,000.00 to $100,000.00. It would be a very decided advantage to the community to give such a franchise, because they can cheapen the rate. With such a franchise there is a good opportunity with securities outstanding for a long time and the company not required to take them up at the end of 25 or 30 years, to reduce the rate, as it would not have to be so great to bring a return on the money. I regard the gas business as a very hazardous business. It is in common with electric light business, of a so-called public utility. We are required to supply any
and all consumers that may apply and it is very different
104 from a merchant in that respect. We can't choose the people
to do business with and in doing that we take more or less hazard in our dealings with them. We put a gas service into practically every one's home and take the chances of their thorough understanding of its operation. You may have an explosion. It may be due to a defect on the part of the company, or it may be due to inexperience on the part of the consumer and we are held either legally or morally responsible for it, which is an element of danger. Then we are subjected to regulation by the state or city authorities, which makes it hazardous.

In this present litigation we feel that we are now being put to an expense through the passage of this ordinance, that is working a great hardship on us, knowing the conditions as we know them. It destroys the belief of the security holders in our securities and that is another hazard you have to meet. A company of this character requires working credits in addition to the capital investment in the manufacturing and distributing plant, not only in cash but in materials and in equipment, before it can do any business. After the gas works is built, before we can operate, it must have a stock of gas making materials. It must also have some appliances to meet any new orders either in the extension of the services or putting in stoves or setting meters. It must have cash in the bank to meet bills presented for which we may get a return later on. It must also have money ahead to meet the pay roll, to pay the employees before we received any payment back from the consumers. Practically all the business done in one month is paid for in advance of receiving any payment for it. The average term of credit extended to consumers is something like 40 or 45 days. The meters are read from the 25th to the end of the month. The bills are payable from the 1st to the 6th of the next month. Assuming that a meter was read on the 25th of one month and the bill was not paid until the 6th of the next month, the term of credit would be from 30 to 40 days. I believe that $60,000.00 was the reasonable working capital of this plant.

Many companies I find on investigation, carried more than
105 that in working capital. The conditions here are unfavorable to the manufacture of gas at a low cost, largely due to the fact that we are a long distance from the supply of gas coal

which comes from Pennsylvania and the freight on it is a tremendous item. The cost of oil also is higher than it is in many cities. The price of labor is as high as it is in many cities and the cost of living is supposed to be high. The cost of pipe for our purposes here is also high, due to it being a considerable distance from the foundry. From my knowledge of this plant I think this is a reasonably efficient plant in the economy of manufacture and distribution. We have watched that very closely and make our economies as low as we can get them and maintain a good service. The more gas you can sell per mile of mains, the less is the cost of distribution and the less the investment in the distribution system. This reduces the charges.

In Lincoln the number of services per mile isn't as great as in Denver, besides the length of the individual service is greater, due to the width of streets and walks. The company here runs its services to the lot lines at its own cost. There was a time when we ran the service to the meter in the house. The company has a considerable investment in services that run clear into the house. By analysis of our accounts here in Lincoln, we found that 99% of all our consumers require an investment in a uniform five light meter, which means that they have a demand not to exceed fifty feet per consumer per hour so that all of our cost for distribution investment and for plant investment is not regulated by the amount of gas made. It must be apportioned uniformly over all the gas consumers. That is, we have very few large consumers who make any demand upon us larger than the others. Practically all of our consumers are small consumers, so that we carry a large fixed cost with them per consumer, while the gas used per consumer is a small amount. The fixed cost for them don't increase or decrease as the amount of gas used increases or decreases. If the company could sell additional gas to these consumers the average cost would be reduced,
106 while if the company continues to take on only small consumers the expenses increase as the income increases. The flat meter rate makes us carry many small consumers who lose us money, and we can't make a reduction to the large consumer to attract that class of business and the other firms selling light or fuel, with whom we compete can, by selling them at a lower price, get the business. We can make a rate which will first bring us our fixed cost and then a reasonable price on such cost as the amount they use, that can attract this business competing with the other firms selling light or fuel.

There is no way that we can take on this business except by offering lower rates. If we will sell this gas at 60¢ per thousand then say to the small consumer that we could sell it to him at $1.20 a thousand, it would not be equitable or legal. The meter charge of 25¢ per month is not equal to the expenses of maintaining the service and reading the meter, making out the bill and collecting it and does not allow any sum whatever for interest or depreciation. For a consumer demanding a five light meter and the equivalent connections, we ought not to have less than $15.00 per year, to cover interest, taxation and the fixed expenses outside of any gas that he

has used and the service can not be for any less sum. The gas business of the company must compete with coal dealers, current dealers, oil and gasoline. I do not think that they are subject to any occupation tax on their gross receipts. The gas business is subjected to the additional hazard due to the variation or the likelihood of increase in the cost of materials, oil, coal and labor. The price on these may be advanced while we are compelled to sell gas at a given rate per thousand feet. The ordinary merchant, if his materials cost him more money, he in turn advances his selling price. The likelihood of hard times or stringency is another thing. The investment in a city is fixed and the money is there. In the case of a merchant if he finds he isn't going to have as good
107 a year, he don't keep as much money in his business. The gas company's is there and must yield a fixed rate of interest and can not be decreased as the times may change. Also the fact that a percentage of our income is paid out as an occupation tax, while others we compete with don't, is also a hardship on us. In our cost we must include something that will cover this percentage which we are required to turn back into the city. Another thing which works a hardship on us is the likelihood of a population center change in a city. We might put in our large mains in a part of the city, while the city grows in another direction, and the people leave these streets and move into another part of the city. We must then put in mains and services in a new district, while the old mains lie idle.

In every city you will find a dead section, a section that was once a residence section, that is now covered with railroad yards and wholesale establishments, while the gas company's money is still in the ground and it has had to double its investment. The likelihood of competition is another element. If a natural gas district should be opened up near Lincoln, we would either have to compromise with the owners of those fields and buy gas from them and try to work up a business in time that would pay interest on our capital or go into a war with them and possibly lose our investment. Another gas company might come in here and compel us to make terms with them and sell gas at a price that would not earn a return on our money. In many cases our gas mains are laid to conform to a present grade of the street. Later on a section is laid out and graded or the grade changed and we are compelled to take up and re-lay our mains. That must be an increase in our investment without any additional returns from our consumers using off that main. We are always subject to liability for accidents occurring while men are at work on the streets. A passer by may fall into a ditch or be overcome by gas while we are making connections. We have all those hazards to take into consideration. Unfair taxation is one of the hazards we have to look out for. In many cases
108 we feel that we are taxed out of proportion to our investment, in looking at it from the standard of physical value, earning power or receipts.

To regulate all our services is another element of hazard we have had to meet here in Lincoln. We formerly had the standard of gas

that is practiced throughout the country. New regulations were made, for instance, increasing our cost and decreasing our revenue. We are subject to that at any time. Every year we are called upon to make investment in extensions of our mains and services, into growing sections of the city. This requires a constant addition of capital, whether the money returns are high or low. As our returns are practically uniform we have an element of uncertainty as to whether those things are paying or not. We have been at times subject to criticism from newspapers, which has made our investment hazardous. The street railway system in the same city may not properly take care of its currents and this will subject us to a considerable amount of electrolysis, which will leak into the mains and services. That is something that we may never know to what extent it may come about. The fact that a good part of our work in the distributing system is done by piece meal adds to our cost. If we knew how large Lincoln was going to be we could lay out all the mains and services on one street at one time and it would decrease the cost of laying the mains. Where we lay out a block at one time, 100 feet at another, 200 feet at another, it makes the cost run up. Then we are always subjected to what you might call the caprice of the public, in which one form of light or fuel is more popular at one time than another and it may leave us with an idle investment on our hands. Some years ago the bent flame gas burner was supplanted by the electric light and later on the engineers perfected the Wellsback mantle, and we have since recovered a good part of that business. Other forms are coming on and we see a tendency which way the lighting will go.

109 Cross-examination by Mr. Stewart:

A franchise is bound to have a value, even though we are in a city like Lincoln where we are compelled to do business under adverse circumstances. Altogether our property has cost us $600,000.00, when without the franchise it would be worthless. The value of the franchise also depends upon the earning capacity of the plant. Under the present rate we earned 2½% on our investment which I do not consider very good business. I do not consider the franchise worth $100,000.00 and I would not give that for the chance of making 2½% on my money, but in getting it I would have a chance of making more than that or I wouldn't buy. In time the business could be worked up even under such adverse conditions as are found here in Lincoln. It could be worked up if we could get normal conditions. I would put a value of $75,000.00 or $100,000.00 on it as it now is. Whether there is a high or low rate of return, the franchise has some value. It wouldn't be a big price and I don't think it would be hard to sell, even though we could only make 2½%. The business here is not very well developed. We have not touched the industrial field. The fuel field has been developed but the lighting field has decreased. In my opinion two-thirds of the output is for fuel. The value of the franchise depends largely upon the future of the business. The property did

better here in 1905 than it did in 1906. In 1905 the gas cost us on an average of 73.4¢ per thousand. The manufacturing cost was 41.8¢ as against 49.89 in 1906. The increase was due to the higher cost of materials and the increase of the standard. The distributing cost increased in 1906 1.8¢ over 1905. I do not understand that there is any uniformity in the charges of this city for electric energy for lighting purposes. It has been a case of bargaining in most cases. It is whatever you can get for the service. You make what terms you can with each individual consumer, especially the large ones. This is because we have to meet the competition of other companies. I think this is undesirable. It would be
110 desirable to be able to make a rate to the gas consumer in proportion to his demand, because we could give him what he wants at a better price, but it would be a short-sighted policy to make rates and bargains to each individual profitable consumer without regard to what is charged to other profitable consumers. Under like conditions there ought to be uniformity of rates. In the classification of consumers the cost of the gas to the consumer who takes less than one thousand feet, is arrived at by taking the manufacturing cost of the gas and apportioning to him the part that he uses. If it cost 50¢ per thousand to make the gas and he used but 500 feet, the consumer in that class would be charged with 25¢ for the manufacturing cost. Then in addition he is apportioned his part of the fixed expenses. We have 6,110 consumers and it costs a given amount to read the meters, make out the bills, collect them, etc. and he is apportioned the same percent of that expense as the consumer who uses 100,000 cubic feet, because they all require practically the same investment for that. 99% of the consumers require the same size of service connections and meters. It is not fair to the man who takes one thousand feet, to contribute the same amount to supervision and officers' salaries that the man who takes 100,000 feet contributes. It would be with 50,000 feet. In truth the small consumers make more of that expense of salaries than the large ones. The manufacturing expense is apportioned to the amount made. The man who uses 50,000 cubic feet takes his gas through the same size connections and requires no more investment than the man who takes 1,000 cubic feet and it is right that the small consumers should pay as much of the distribution expenses as the large consumer. The dividing line comes when the demand upon us is increased. As long as all of the consumers are making the same demand, these expenses are apportioned the same. The unaccounted for gas in 1906 amounted to about 8¢ per thousand feet. This tabulation is based on the business of 1906. The manufacturing cost of gas that year was 47.89¢ per thousand feet. To consumers using in excess of 50,000 feet the operating cost exclusive of interest and depreciation, was 57.3¢. The 8¢ for unac-
111 counted for gas is a portion of the fixed expenses. The 8¢ for unaccounted for gas would bring the manufacturing cost up to 55.89¢ per thousand. That would include the cost at the plant and the gas lost. This would make a difference of about 1½¢ which is the proportion which the large consumer would pay for

the other distributing expenses. On 500,000 feet it would be $75.00. The average total operating cost for all is 82 68/100¢ per thousand. This is made up of the collection expenses, general expenses, distribution expenses and does not include leakage and unaccounted for gas. The small consumers should not pay any larger percentage of the leakage than the large consumers. The leakage is practically fixed by the demand, but the consumer who takes 1,000 feet of gas is charged a greater percentage on leakage in proportion to the amount of gas sold, while the balance of the expense is in proportion to the capacity or demand. We have a per cent of leakage the same as we have a per cent of the manufacturing expenses per thousand sold.

The item of general expenses is apportioned to the number of consumers, on the assumption that the demand of each consumer is the same, but there is a difference of one per cent on the large consumers. The man who uses a few thousand cubic feet is as expensive to the company as the consumer who uses 50,000 or 100,000 cubic feet, so long as both are supplied through a five light meter. When a larger meter is used for the larger consumer, the smaller consumer is not so expensive. A five light meter will run 438,000 cubic feet a year, if it is run continuously. If a man using 100,000 feet used that for one hour of a day we would have to make an investment of a given amount. If he used that in a total of ten hours, we would have sold the same in each case, but in one case we would have had the expense of mains, service, moving the plant, etc. The fact that one man uses 100,000 feet in one hour and the other man uses 100,000 feet in ten hours, doesn't mean that the tax on us is the same. It depends upon how much we have to invest to sell each man. There are very few that take
from 100,000 to 400,000 feet. That is what we call a desir-
112 able load factor. If the consumers require a greater capacity, they should be charged in proportion. I have not figured that out here, because they are less than 1%. The same rule would obtain in a less degree as to the consumer that takes 50,000 or 100,000 cubic feet per annum, if the demand was greater than the usual demand. The demand would not be greater if they simply took more gas. One consumer might have twice as great a demand as another, although both used 100,000 feet. In a case of the newspapers, the consumption isn't such a great demand, but it is a constant one. As a general proposition, a small consumer don't tax the plant and the capacity like the larger one and the rate has to be settled on the general proposition. We would not think of asking that the small consumer pay more money after he has made his investment in range, pipe and fixtures, but this tabulation which I have made shows that a re-adjustment is necessary and it ought to be taken into consideration. I wouldn't recommend that the cost be crowded on other consumers, but this is a condition that we are up against in starting out on straight meter rates. The tabulation is to show the inaccuracy of the present plan.

In putting the present rate into effect, we followed the past practice instead of using good judgment with the real conditions. When

we reduced our rate the last time, we made the unprofitable consumers more unprofitable to enable the people who wanted a large amount of gas to get it at a price where they were able to use it. You might reduce the price to the large consumer and not to the small one and confine it to that, but a straight reduction on the gas rate would not let us offer a reduction to all. There is a question whether you couldn't come in and say I will pay 80¢ per thousand, the same as the Starr or the Journal Company, but if you were to come in and pay us an amount to take care of these fixed expenses, then we could give the reduced rate. I do not think there ought to be a minimum charge, but a charge depending upon the fixed expenses. It is a charge entirely outside of any gas consumed. It is a constant charge taking care of a constant expense. It is based on the fact that we have an investment there that we are
113 entitled to receive an income on and are entitled to have a fund to keep it in repair and maintain it even though they take very little gas. As long as they are using it we are entitled to pay for those items of income on the investment. We now have on our books consumers who cost us $2.00 for a thousand feet of gas and they pay us $1.20 which makes a loss of 80¢. If we should reduce our rate to $1.00 per thousand then the loss on those consumers would be $1.80 per thousand. That is just what we did do, although this matter of the change of rates has been advocated here for some time. On the usual demand the investment in the service meter and connections, not including the investment in house connections for ranges, is about $26.50. That is for lighting alone. For fuel it would be more. On that we are entitled to 7% or 8% in addition to the 5% depreciation. We do not contend that we can put all our consumers on an exact equality, but we hope to approach equity. We always make more money out of some consumers than others, and always have to carry certain unprofitable consumers, and the regulation of rates ought to be so as to leave as few unprofitable consumers as possible. We never expect to eliminate all of them. It would be impossible to do that, even though we had absolute control of the business. In doing so you could put yourself in such an unfavorable light in the community that it would be harmful to the business. If we were to say that they should pay $2.00 per month, for what they use, some would pay it, but it would drive much business away from us.

If we could get a right to absolute equity that is what we ought to have. Depreciation is a fund to take care of replacement of the plant when the time comes that it practically all goes to pieces and has to be replaced. By laying something away we take care of the day when we have to rebuild the plant. This company has never adopted that form in a definite way. On the other hand such funds as they had in excess of paying interest on outstanding securities has been re-invested in the plant and has not been taken out.
114 Those re-investments have not been charged to operating expenses.

We have a certain amount of bonds out for investments made in the property. We have certain other property which is represented

117

by what our books show as over and above operating expenses and interest. That is, if we are putting in a machine this year and have $10,000.00 in excess of paying the bond interest, instead of selling bonds to get that $10,000.00 that money has gone back into the plant in the money in excess of the bond interest and had gone back into additions so that a replacement would show the property on which no bonds are outstanding. I understand that there has been very little of charging to the construction or capital account, the additional value of a new part which is replacing an old part, over and above the value of the old part. In a short time there will have to be a great deal of it. The mains from the works up town will have to be replaced by larger mains. In Denver we have to do it but we are not charging that out of the operating expenses. We are taking that out of reserve. It is due to inadequacy and in repairs. We have never provided in our books any depreciation fund in connection with this plant, but we have been putting back into the property whatever was left after paying the bond interest. Where a new machine is put in, not to take the place of another but as an addition, it would go into the property account as an asset and an addition. Where a new machine is put in to take the place of a similar machine, the cost would have to come out of this reserve. Up to this time those items have been taken care of by the operating expense account, but there has been nothing of that kind done that I know of, except a few small lines of mains. The refilling of the benches is a running expense and is always taken out of the operating expenses. Up to this time there has not been very much of what I would call depreciation proper in this plant. Depreciation proper comes all at once after you have gone a good many years. That would be true of a plant particularly and also of the mains if they have had any trouble from electrolysis. However, inadequacy in the mains is the main cause of depreciation. Any inade-
115 quacy is something that comes in big chunks. If we could not get adequate pressure that would come all at once. If there was an inadequacy in one block that wouldn't be a very big item, but it might extend for several blocks. There probably would never come a time when we would have to replace all of our mains at the same time. From the history of the business the company usually, when it finds any inadequacy, simply abandons it and builds new works rather than put in new machinery in the old works. Such a thing could happen through inadequacy in a plant which has been kept as efficiently as this one has. It would be necessary in case of inadequacy to discard all of the present plant, but it would be better to put up entirely new works and operate an all new plant, rather than operate the old or run two plants.

We will soon have to increase our capacity in the works, if we put in another water gas machine. We will have to put it in on other ground as it is best for us to get a sufficiently large one, in this one building, because greater efficiency can be maintained by using one big machine. If the small machine is efficient and an un-to-date machine, we will hold it idle and keep it for reserve. We must have something for reserve all the time. We practically have

nothing for reserve now. Our works are nearly inadequate. In Denver we have bought ground to build entirely new works, believing that we are now up to capacity and we are getting a new site because we can operate one plant cheaper than we can operate two. As far as I know the running expenses have all gone into the operating cost at this date, but there has practically been no replacement either because of decay or inadequancy. I am speaking only from the time I have been familiar with it, since 1901. It was an old plant when we got it, and had been in operation for ten years. It had been reconstructed about 1890 or 1891. I don't think they took up the old mains at that time. There were very few mains. The city was smaller and required less. The oil here is cheaper than in Denver, but it is higher than it is in the east. The companies at Cincinnati, Milwaukee and Des Moines were paying practically 3¢ per gallon for oil. We paid last year 4 1/10¢. I
116 do not know anything about the price of oil in Sioux City or Des Moines. The companies at Sioux City and Des Moines are owned by the same people that own the Omaha company. At the time our gas here was $1.20 they were charging $1.30 and $1.05 in Sioux City and Des Moines. When we were charging $1.30 in Des Moines they were charging $1.20 in Omaha. With like owners the charge in different cities depends upon the cost of manufacturing and distributing. The people I am with figure only a reasonable return and they voluntarily make reductions when they find their income is running over a reasonable return. I don't know whether that is the reason they reduced it here or not. If the demand is large enough to have larger mains to supply numerous large consumers than to supply numerous small consumers, the amount of hourly demand fixes the size of the main. The demand in a residence district comes at about the same hours, and the mains that supply large residence consumers will have to be larger than those used to supply small residence consumers. It don't make any difference whether we are supplying gas to one consumer or to one hundred, it depends upon the amount you make. Of course a larger demand requires a larger investment.

FRANK W. FRUEAUFF, recalled, testified on behalf of the plaintiff on rebuttal as follows, pages 450 to 464, printed record:

Direct examination by Mr. Rose:

In 1901 I was secretary of the Denver Gas & Electric Company and I did some general auditing work for the various McMillian companies. The entries on page 191 to 194 inclusive of Exhibit 140, the Journal of the Lincoln Gas & Electric Company, are in my handwriting, and they are the closing entries of the Lincoln Gas & Electric Company. I was directed to come here and under the direction of Mr. Doherty, to close up the affairs of the Lincoln Gas & Electric Company and open the affairs of the Lincoln Gas & Electric Light
117 Company, in my capacity as Auditor, and those are the final entries of the Lincoln Gas & Electric Company, and include the business of that company up to the close of November,

1901. They had sold and turned over their assets and liabilities to the new company.

The records following this are the records of the Lincoln Gas & Electric Light Company, beginning as if it were a new Journal in another book. At that time we debated whether or not it would be better to purchase a new Journal and commence a new record for the Lincoln Gas & Electric Light Company, and concluded that in as much as a very small part of this book had been used, we could very well use this Journal for the new company, so we opened up the new company in the same Journal, although in a sense it is an entirely different book. The opening entry of the Lincoln Gas & Electric Light Company comes at page 201. That is also in my handwriting, running over to page 203. The opening entries there include all of the business for the month of December of that year. We took over the affairs as they stood at the close of November and commenced on the first of December and this record contains a continuous record in point of time from the close of the affairs of the old company to the opening of the new. They can be verified by the examination of the entries, where one is closed, and it shows that the accounts were properly transferred from the old to the new company. In the change from one to the other we did not suppress any of the business. There is a continuous record. There was nothing to suppress. I do not know why there are some leaves out. I have no recollection of it. Those pages were either omitted or missing. I don't know. I do know that we proposed using the old book rather than purchasing a new one. There is a continuous record which can be verified by tracing the various balances as they are brought over. There was nothing suppressed. The record is in the exact condition that I left it after checking it up and making the closing and opening entries. I have kept in pretty close touch with the contracting of supplies for gas companies as Secretary and manager of the Denver Electric & Gas Company. I have been very closely in touch with what they have purchased.

118 In the past year I have been more directly associated with the New York office and I have kept in pretty close touch with the purchase of all supplies for the properties in which they were interested and supervised and approved contracts and aided in getting favorable markets, and I was actively engaged in that part of the work. That is one advantage that we think we have in our joint work, that is, we can buy at the best advantage and in quantities and in doing so get some benefit. Mr. Malone was employed in this case at my request. I asked him to come to Lincoln and get the data, together and worked with him in preparing the estimate he afterwards submitted. I did that as Vice President of this company. In estimating the value of cast iron and wrought iron pipe, I informed myself as to the market value at that time. We requested a bid in writing from the agent of the United States Cast Iron Pipe & Foundry Company, which is the largest manufacturer of cast iron pipe. We asked him to quote his prices on the various sizes delivered in Lincoln and we used that as a basis for our estimate and it was a good faith estimate. I then knew the market value of cast iron pipe of

the different sizes and I have here the original bids which we received at that time. Exhibit 150 is the bid of the agent of the United States Cast Iron Pipe & Foundry Company. We were large users of this product. We were able to purchase it at as close a figure as other dealers. We believed we were able to get as good a price as anyone purchasing that material in the quantities in which we bought it. We bought a very large order from that firm last year. The prices there are the prices that we or any contractor would have been obliged to pay at that time. That was the best price we could get. We purchased from him last year because his price was lower than any quotations we could get. Four inch pipe delivered in Lincoln last August was of the reasonable market value of $39.85 per ton. Six, eight and ten inch cast iron pipe $38.85 per ton. Twelve, fourteen and sixteen inch cast iron pipe $38.60. Eighteen and
119 twenty inch cast iron pipe $38.35 per ton. Standard specials are the connections and off takes from the pipes that are used in running, like the T's and crosses and various pieces that join one pipe to another. The reasonable price of those connections and T's in Lincoln was $65.10 per ton.

Exhibit 150 is offered and received in evidence.

That Exhibit is in the hand writing of Duncan Bond. He is the Denver agent of the United States Cast Iron Pipe & Foundry Company. In my opinion the operation of a combined water and coal gas plant in Lincoln, is more economical than to operate just a water gas plant, taking the experience of the best years, as a guide. The combined system of coal and water gas, all things considered, is the most efficient and economical for this particular point, because of the fluctuation of the price of either coal gas or water gas materials, it is well to have either one or the other to fall back upon. It is well to be able to substitute one system of gas making for the other, as the occasion requires. Due to the regulations regarding the candle power and heat units, it is well to be able to have both systems to secure the best results economically. The operation of a coal gas plant tends towards economy regarding the water gas plant. One prominent figure is the manufacture of coke. The coke made in our coal gas plant furnishes fuel to use in our water gas machine. If we didn't have the coal gas plant we would have to buy the coke outside at a higher price. We would have to have it whether we made it or not. There is no alternative for water gas machines. You could not use Anthracite successfully as the tremendous cost makes it prohibitive. You can not use any coal of a lower grade as a generator fuel for the water gas.

As Auditor and as Manager of the Denver plant, I have had experience in comparing statistics with relation to the manufacture and cost of the distribution of gas. In the Denver plant we have a very complete system of showing the cost of various items running back for a number of years. In the New York office we have the same record of various companies in this respect. We have
120 the improved machinery that has been devised as aids to making rapid and accurate mathematical calculations. One machine that we use very frequently is what is known as the

Thatcher calculator, which enables us to divide as rapidly as we can put the figures down. We use that to get the per thousand cost of the various items or the per unit cost. Then we have what is known as the Hollerith tabulating machine, which enables us to classify our customers into kind of customers, quantity used and districts in which it was used, etc. We have kept up our compilations and statistics constantly for a number of years. I do not think the statistics for a period of a year are a reliable guide. You ought to use the data for a number of years. You can not use as an absolute guide the statistics in any particular locality. The statistics for a number of years are much more valuable than the statistics for one year. The greater number of years the more closely do you get reliable information.

A theoretical prognosis of the probable business of this company for 1908 would not be as reliable in determining whether a one dollar rate could have been maintained by this company beginning with January 1, 1907, as either the actual experience for the year 1906 or 1907. The prognosis of a year to follow is not as accurate as the practical experience of the past years. In my opinion there will not be any added saving from residuals in the currect year, and I do not think there is any merit in assuming that there would be any saving. I would not predict that there would be. I do not think there will be any saving upon the item of legal expenses in the current year, when it is concluded. I would predict that our legal expenses will be more instead of less. I do not think there will be any economy in the manufacture of coal or water gas, on account of the reduced expenses for obtaining new business, and I do not believe it would be practicable or tend to the general economy of the manufacturing and distributing, to reduce the ratio of expenses incurred for obtaining new business. Where the reduced schedule of prices is arbitrarily put into effect, the only way to make
121 up the net revenues of the company, is by increasing the sales, and it is not practicable in such a contingency for the company to continue business without increasing the ratio of expense for the item of new business. A reduction of those would bring little or no new business to the company. There must be carried on a new business campaign conducted to increase the sales materially. This would be an added expenses such as would bring with it an increase in sales. There is no way known in the practical operation of such plants, by which the company can get any advantage out of the reduced rate, except by advertising generously and employing solicitors and canvassers. The capacity of the water gas making apparatus could not be increased without an increase in the invested capital. You would have to have additional equipment and that would mean the investment of additional funds and would add to the interest charges of the company.

Since the testimony was taken by the plaintiff last September, the company has invested additional funds here, at a cost of something in excess of 7% for the money. It has purchased new equipment and has laid additional mains, put in additional meters and put in additional water gas apparatus and has incurred the cost

of these. The storage capacity of a plant is not governed by any set rule. It depends largely upon local conditions. It varies with each plant, as to the quantity of holder capacity they have. It does not in any wise tend to economy, where a four inch main has become insufficient, to reinforce the main in that particular line by putting in another one at its side. As a rule they take out the smaller main and put in a larger one. There is more economy in operating one main than in operating two. As a small main becomes inadequate, it is better to take out the small one and put in a large pipe and use the small pipe in some other locality. To run two mains would double the number of joints in a given distance and increase the likelihood of leakage and opportunities for leakage. In the distribution of the expenses of the two departments of the com-
122 pany, such as the expense of collection and management, and items of that sort, we have favored here the gas department at the expense of the electric department. For instance, in the matter of our clerical expenses and office expenses, we have apportioned them on a basis that favored the gas department and harmed the electrical. Those expenses ought to be divided more according to the number of customers supplied than at present. The volume of clerical work follows very closely the number of services or meters. If that plan had been adopted and followed here, the portions chargeable to the gas department would have been greater than the two-thirds which we have allowed them and the electrical proportion would have been less. My recollection is that we divided it about half and half, while we have almost twice as many gas customers as electric. They have not been divided here in proportion to the number of consumers of each class supplied and it ought to be more closely apportioned. The gas department has more than twice as many consumers.

In 1908 a return of $1.00 per thousand feet of gas would not have yielded any return to the invested capital of this company using fair and economical management, because the supposed various savings in operation suggested by witnesses are not justified and could not be realized if the experience of the past is examined and without those savings we would have a serious deficit. The rate of one dollar per thousand cubic feet would not yield a profit of 23¢ to 26¢ per thousand, over and above the expenses of manufacture, distribution and maintenance. From the actual experience of the company in 1907, had the one dollar rate been in effect, in my opinion the company would have been bankrupt. It would not have been able to have paid its just operating expenses. I supervised the accounts to a certain degree at this time, and am acquainted in a general way with the disbursements of its funds. There were 179,366,000 cubic feet of gas sold in 1907. A reduction of 20¢ per thousand would have made a reduction in the revenue of $35,873.20 and if the one dollar rating had been in effect that year, the
123 2½% occupation tax on the gross receipts would have been $4,480.15, and the aggregate of these two items is $40,353.35. If the company was called upon to pay that tax at this time for 1907 and refund this excess in rate to the consumers, it could not continue

business. It couldn't do it and have any earnings of any sort to devote to payments on its invested capital.

Cross-examination by Mr. Stewart:

At the time I made the entries in Exhibit 140 I was Secretary of the Denver Gas & Electric Company and was also doing auditing work for other companies when they sent me out in that capacity. Mr. Doherty was also interested in the Denver company. The Lincoln Gas & Electric Light Company at that time was the Lincoln Gas & Electric Company. The individuals who made the purchase were Mr. Doherty and Mr. McMillian. They represented other people, who I don't know. My employment was by them. I am now Vice President of the Lincoln Gas & Electric Light Company and have been for two or three years. That has been my only employment with that company except on special work like this. I secured the information for the opening entries of the Lincoln Gas & Electric Light Company from Mr. Doherty or from the books of the previous company. The reports from this company are sent in to our New York office and the data is compiled from them and as President of the local company I make it a point to examine these reports as they come in and comment and criticise them. The company does not keep any books in the New York office outside of the copies of these monthly reports. I believe the stock books are kept in Emerson, McMillian & Company's office, who are transfer agents of the company. They are not in the office of Doherty & Company. My memory about the outstanding stocks and bonds of this company is a little hazy. There are $2,225,000.00 of stock outstanding, $333,000.00 of 6% first mortgage bonds, and about $700,000.00 general 5% mortgage bonds. I secured that information at the time I opened the books, either from the records of the old com-
124 pany or I was given that same information by somebody else. I think the old company's stocks and bonds were taken up, bought in or exchanged for securities of the new company. I do not think that they were left outstanding. I would want to consult the books before I answer that definitely. The Lincoln Gas & Electric Company's bonds were taken up and the Lincoln Gas & Electric Light Company's bonds issued, but the old Lincoln Gas bonds could not be taken up. Those remained outstanding. I think there was $333,000.00 of them and the property was bought subject to them. The old holder surrendered $655,000.00 of the old company's bonds and turned in $77,000.00 in cash and they received for it $723,100.00 of the new company's bonds. I don't know the individuals who surrendered these bonds and did not know at the time I made the entry. As I recall it I got my information from the directors' meeting held at that time in which the proper resolutions authorizing it were passed. I did not see them surrendered. Mr. McMillian and his associates represented these holders. Who they were I don't know. The purchasers of the old company were represented by Mr. McMillian. I have seen a list of the stockholders in the present company. I do not know who owns the bonds of this

company except I occasionally run across people who say they have some of them. I do not know what the purchasers paid for the old company except as I have given it there. They assumed the assets and liabilities of the old company and turned back the old securities and received the new ones. I would not say they turned theirs over or if someone else turned them in. I do not know. I would not say they were exchanged by the individual holders, from one security to the other. Even though I am Vice President, I do not know who holds these bonds. We have no direct interest in them. The money to pay the coupons is deposited with the fiscal agent in New York and the coupons are presented by banks, trust companies or individuals. We have no record showing who those people
125 are and have no way of knowing. I have none of the bonds. I do not know about the other officers. I know the other officers are stockholders, but whether they are bond holders I do not know. I know that Mr. Doherty owns the company's note for money advanced to it to the amount of $20,000.00. That is shown on the books. There are something over $700,000.00 of bonds outstanding now. I don't know the exact number.

126 GEORGE KNOTT, being first duly sworn, testified on behalf of the defendant as follows: Pages 268 to 273 printed record.

Direct examination by Mr. Stewart:

I reside in Lincoln, Nebraska and have since 1892. At the present I am assessor. I used to be in the grocery business. My store was located at 1st and L streets. I sold out three years ago this summer. I had been there sixteen or seventeen years. That is the next block west of the gas company's plant. I assess in the second ward from M to F and from 11th street west. This territory includes the gas company and I assess real estate in that section of the city and am acquainted with the value of lots in that part of the town and I am acquainted with the block of ground where the gas company's plant is located. The lot values in that locality range from $250.00 to $400.00. The corners of course are worth a little more. The inside lots of the gas company's blocks are worth $250.00 and the corners are worth $400.00. I am Deputy County Assessor and have assessed in that part of the city for thirteen years.

Cross-examination by Mr. Rose:

This block has all of the railroad facilities that it needs. I think it has a track right in the center of it right through the block and it has some east of it. There is one track that runs right through the middle of the block so that they can unload their coal either way. I can not think of any sales at the present time of real estate with trackage facilities, for store house or ware house purposes along the B. and M. railroad track there. There may have been sales of lots in that vicinity for as high as $2,000.00 with trackage facilities. I don't know. I don't know where it would

be. There are no lots down there in that locality with trackage facilities that can be obtained for $400.00. I do not know of any lot between the gas plant and the Burlington station, with track-
127 age facilities that can be approached for $400.00. I do not know that there are any lots that have trackage facilities in that neighborhood within two or three blocks. The railroad is right east of the gas company's plant and between the tracks there are no lots and there are none for sale. There have been no purchasers of lots adjoining the gas company's lots in the last three years. The lots which I have assessed at $250.00 are used for dwelling houses or any other purpose that you want to use them for. I would make no difference between a dwelling house lot and a trackage lot in that vicinity and in making this value I don't take into account at all the fact that the gas company's lots have railroad and switching facilities which enables the lots to be used for commercial purposes, and in my estimation that would not cut any figure in the value. I ran a grocery store down there. It is my own business how large a room I had, and I refuse to state whether I had the grocery store in my private residence and also how large a store I had. It was a small store. The building was 18 by 24 and the stock ran from $800.00 to $1,500.00. I have no occupation now except as county assessor and that occupies my time for three months or more. The rest of the time I get a job as bailiff in the District Court. I have bought and sold real estate in the last two years. I sold that property down there three years ago for $1,050.00. It was 75 feet and it had about $2,500.00 worth of improvements on it. It has not increased in value in the last three years. Real estate generally has increased but down there it has really gone down. It was worth more than $250.00 a lot before the gas company was there. I was there before the gas company moved down there. They moved down about 1891 or 1892, if I am not mistaken.

128 THOMAS H. PRATT, being first duly sworn testified on behalf of the defendant as follows: Pages 273 to 276 printed record.

Direct examination by Mr. Stewart:

I am city Clerk of the city of Lincoln and have been since April, 1899, and as such Clerk I have custody of the ordinances passed by the Mayor and Council of the City of Lincoln. Exhibit 102 is a certified copy of one of the ordinances on file in my office. Exhibit 102 offered and received in evidence. Exhibit 103 offered and received in evidence. I have examined the records in my office and have ascertained that there is no other ordinance passed by the city of Lincoln regulating the price of gas, between this ordinance dated October 9, 1899, and the ordinance set out in the complainant's petition, dated November, 1906. There is nothing pending but those two ordinances. That is the one dollar gas ordinance. The only one now pending. Whether there was one

passed and repealed or not, I am not sure. I will look it up and if there has been any other passed, I will produce it.

Cross-examination by Mr. Rose:

Ordinances are introduced in the Council from time to time in quite a number. The subject of gas rates has been one of rather continuous agitation in the Council itself and in committees and has been a subject of frequent conferences between the gas company and the city. The reduction of the rate by the gas company from the maximum of $1.50 prescribed in the 1899 ordinance to $1.20, was made by the gas company without coercion and authority of the city ordinance. There was an ordinance introduced and it was referred to the committee. Mr. Dunn was a member of that committee. He stated that the company ought to be required to reduce the gas to $1.20 and said that the company had agreed to reduce it to that price and the matter was dropped. There was no written report made by that committee. There was an oral report made by Mr. Dunn in open Council. I was present
129 when it was made, but I don't think it was made a part of the minutes. He just made a statement.

Redirect examination by Mr. Stewart:

I don't know when that was done, but I think I can find out.

Recross-examination by Mr. Rose:

Price to this incident, there were two different rates, one for light and one for fuel. After that there was just one rate.

Redirect examination by Mr. Stewart:

I do not know when this one dollar gas ordinance was introduced. Other ordinances were introduced prior to that regulating the price of gas. I don't know positively but the records will show.

130 Ed. R. Bing, being first duly sworn testified on behalf of the defendant as follows: Pages 276 to 298 printed record.

Direct examination by Mr. Stewart:

I reside in the city of Lincoln and I am assistant city engineer and am in charge of the paving. I have been a civil engineer about seventeen years. I have been with the city about that length of time. I have done sewer work and paving. By sewer work I mean digging trenches and laying sewer pipe. For the last six years my work has been principally paving. During that time I have had experience in the matter of digging and laying sewer pipe and taking up and putting back paving over sewer pipe and gas pipe and I think I am familiar with that class of work. There is considerable difference in laying these mains and sewer pipe. You use a different kind of construction altogether. In gas and

water pipes you use iron pipe and lead joints and in sewer pipe the joints are just filled with cement. I am familiar with the cost of the gas pipe and the value of it only to the extent that I have looked it up recently. I have investigated that question a little. I know what the cost of labor is in this vicinity for the work of laying mains and sewer pipe and I have made figures on the value and cost of replacing mains and service pipe of the Lincoln Gas Company in this city. My estimate is Exhibit 104. I figured gas pipe at $33.00 a ton. That is about the market price at the present time. Everything over four inch pipe is cast iron pipe. I figured the two inch pipe per foot. At the present time the cost is $11.60 per hundred feet, which is the market price. Exhibit 104 shows the number of lineal feet of the different sizes of pipe, miles and tons and shows the cost of two inch pipe per foot and of the cast iron pipe per ton. This Exhibit shows the various items that would go into rebuilding the mains and services of the Lincoln Gas Company from present prices and from what I can gather and I would say that it can be done for that money. It totals
131 $241,427.29. This *This* includes the cost of taking up and replacing the pavement over the mains and services in paved streets. That item separately is $59,894.80. From my knowledge and experience in this class of work, I would say that the figures I have given here would replace the mains and services as shown on that sheet. Exhibit 105 shows the weight of the different size cast iron pipe and pounds of lead per joint on the different sized pipe and the cost of equipment per service and contains the figures that I used in making my computations in Exhibit 104. Exhibit 105 offered and received in evidence. The figures that I have used are the correct figures and the fair and reasonable market value.

Cross-examination by Mr. Rose:

I have never worked in the construction of gas plants and have never worked in the construction and placing of one service at a time. It would make a difference in the cost of services where they are put in on special orders from time to time and where they are constructed all at once. Where they are put in piece by piece as ordered it is the most expensive. That would involve the gathering together of supplies and a special trip made by the men and a team and time to and from the work. My entire experience in civil engineering has been in the service of the city of Lincoln. In a sense I worked for a while at bridgework for Sheeley and O'shea. That was just a short time. I was out of the city's employ for possibly one year. We were constructing just pile bridges. There is a great deal of difference between that sort of work and the engineering in a gas company and I do not think that would particularly qualify me for estimating the cost of the construction of the gas works. There is also a great difference between the construction of bridge work and gas works. I have also kept a pretty close record of the cost of digging, back-filling and all of the items of cost in laying sewer pipe and we keep a correct record. We do not keep any record of the

cost of water that we use in floating. That is merely drawn
132 from the water department free, and neither do we keep any record of the permits paid. The city does not have to take out permits to do its own work. To do a job of private plumbing requires a permit. They don't require permits in dirt streets. I did not estimate anything here for permits or water. I did not figure the lead joints. I have never had any experience in laying pipe with lead joints. I allowed in a general way here the cost of a competent engineer for superintending this work while it was going on but I did not make any special item of it. It is covered though in the cost. The cost of the four inch pipe we figures at 14¢ the running foot, on twenty inch pipe 40¢. The price is figured at $33.00 per ton, both sizes. It can all be bought at the same price. I did not know that the cost per ton of a larger cast iron pipe was greater than a smaller cast iron pipe. It is not according to the quotations we had. I had quotations from current dealers who handle such pipes. The quotations I refer to are from the Municipal Journal, and there is a quotation of $33.00 per ton cast iron pipe.

I did not allow any sums for accidents or liability insurance. That is an element. I don't think I omitted it. I did not make any allowance for that one item, but we put the price of construction at such a figure that it will cover that. I figure 58 1/3¢ per running foot for the cost of replacing asphalt pavement over four inch pipe. It costs money and requires considerable labor to cut through asphalt pavement and you also have to go through the bed of concrete, binder and asphaltum, and when the opening is made the pavement has to be replaced with new concrete, new binder and new dressing and the dirt below has to be tamped or flooded. It could be both. At the present time, under the guarantee that now exists on asphalt pavement here, the contractor is compelled to put back this kind of pavement wherever water or gas goes at the same price per yard that he gets for the original work. He is compelled to do this under the city ordinances. That does not hold good if the guarantee has run out. The cost of cutting the pavement would be added. I have just figured
the cost to the city of this asphalt pavement. I do not see
133 any reason why I should not. I do not know at the present time how many of the asphalt guarantees have run out. There is one district in the city of two blocks that the guarantee has run out.

So far as I know the Green River Asphalt Company is solvent. The city has a cash retainer of some kind for a guarantee on the O street pavement, but I do not think that company could be compelled to perform its contract to replace openings on that pavement. I do not think they can get service on them. I do not know whether it is insolvent and bankrupt or not. The asphalt pavement on 11th street was finished in December 1898 and the ten year guarantee runs out December 1908. Ten years is the highest term that has ever been given as a guarantee. A five year guarantee is the lowest term. That covers two blocks on 12th and one on N; the balance is all ten year stuff. Everything that has been put in up to N is under the ten year guarantee. I do not take into consideration the conditions

under which the opening of asphalt pavement is permitted by ordinance. I think the gas company has filed a bond with the city Clerk to take up and replace all the different classes of pavement. I don't know about asphalt. They probably pay the contractor his price for replacing that. I can not say in that one respect. They have a bond to take up and replace in as good condition as it was and the bond covers damages in case of accident, the gas company to hold the city harmless.

Notwithstanding these conditions, I just allowed and figured the same sum per year for replacing the pavements that the city had to pay for the original pavement. I figured on a basis of going right in and taking that out and putting this construction in, putting the pavement back in first class shape and completing the job. I think the company could do it as cheap as the original price. That is my judgment under our guarantees here. It would be impossible to replace the area removed by a ditch at the same cost the entire street was paved for. All of my figures are based upon an average in a general way. As a matter of fact the cost of digging a trench for a 20 inch pipe is much greater. You have to dig a wider trench. The
134 cost of digging a trench for a 20 inch pipe would probably be double the cost for a four inch pipe. I took an average on the ditch for all classes of pipe.

You can lay most any pipe up to about twelve inch pipe, outside of your bell, in a 22 inch ditch. There is no 20 inch pipe under asphaltum. I do not think there is any sixteen inch pipe nor any twelve inch. The schedule there will tell that. I believe you can lay a twelve inch pipe in a 22 inch ditch outside of the bell. They generally dig around the bell so they can calk or lead, etc. A 22 inch trench will cover a ten inch pipe nicely. There are 45/100 of a mile of ten inch pipe under asphaltum and a little over one-half a mile of eight inch. For laying of an eight inch pipe I would not open the asphaltum at the top any wider than twenty inches, which is wider than eighteen inches. It would be a question of judgment. We could open it eighteen inches and lay the pipe there or we could open it twenty. That is usually up to the superintendent or for-man. A ten inch pipe could be laid in a 22 inch ditch. That would be about right. I figure on an opening of 12 inches for a service pipe. In ordinary practice if they don't bore, the opening for a service pipe is made eighteen inches wide. If we were opening up asphaltum I don't believe it ought to be opened any wider than twelve inches to keep down the cost. I estimated an opening of twelve inches for all services except brick. In dirt streets we would probably take out about eighteen inches and in brick streets we would take out about the same. For the laying of any sort of main under the brick pavement, we would have to have about a twenty-four inch opening. The workman could not make the connections in a twelve inch ditch. They might do that but they would block it out to get room to work. That would require a litile extra work there to make the additional opening wider. In the service pipes I am figuring only to the lot line. The average length of service pipe is 50 feet. I do not go beyond the lot line, and we did not allow anything for the cost of

permits and did not figure anything for carrying the service
135 from the lot line to the inside of the house, nor did I allow anything for meter connections.

I think the gas company at one time constructed these service lines to the inside of the house and made the connections with the meters. I am not sure of what they are doing now. I was not asked to figure that far in. If that is a proper item to be allowed I have made no estimate upon it. The item of $3.35 for labor is the labor for one service. It consists of the labor costs of the services, an average of 50 feet in length on dirt streets. I am not in shape to give you the different items that make up this total of labor. I went into the details at the time I made up the schedule but I do not have them here. I made no inquiry as to what the actual cost of the labor was in those cases to this company or to any other company. I based it on prices we pay men for ditch work. In addition to the men who dig the trenches the pipe-fitters' labor would be figured in making this service. He generally gets about 25¢ an hour. In bridge work ten hours per day is common practice. I believe the law provides for eight hours. The average tradesmen here runs from eight to nine and ten hours per day in common practice. I don't know that I know of any tradesmen that work to exceed eight hours per day for a day's work. Eight hours ordinarily constitute a day's work of all kinds in Lincoln.

We figured $9.00 as the whole cost of a single service. There is no labor involved in this item of $3.35 outside of the gas fitter and the trench digger. It costs something to transport the material and distribute it but I get an allowance for that. The drayage for a single service I figure at 50¢, that is, where you are putting them in right along in a street. I did not figure on going out and spotting one in here and then going out to another part of town. I figured this as a joint business. I figured it as a straight proposition, completed all at one time. For an eight hour day I can hire a trench digger at $1.75 per day. Most anyone that is digging a sewer trench or any class of digging can hire efficient men at that price. In a great many cases the price of common labor is $2.00 a day for
136 eight hours in Lincoln. That has been the general and prevailing price, but I do not believe it is at the present time. A fair digger would open up 100 feet of 2½ trench easily in a day. The width of such a trench would be about sixteen or eighteen inches. This would average about 12½ feet an hour. This is not paved streets. It is in dirt streets. I used this same $3.35 in the paved streets, but I figured the cost of the paving separately. 2½ feet was the depth that we figured the services below the ground. The main trenches varied and I figured on about a 3½ foot ditch. At the point where the tap was made, the service trench would have to be as deep as the main trench. I figured it on an average. I am not in the gas business and I would not want to say that I know exactly what would be required for trenches for this pipe, but we figured the services on an average depth of 2½ feet. I would not figure the depth of the service trench at the lot line at 1½ feet. It is possible that we figured the service trenches on a three foot basis in depth.

We figured it up, I know that. I would not swear whether we figured at 3½ or 2½. Make it either one you please and we will go ahead that way, or make it three feet. I do not believe now that 2½ feet would be a sufficient average depth in a great many cases. I will admit that that depth would run the services very close to the ground at the house, but I will stand pat on that anyway. I think that is the basis we figured on and I will stay by it. If I made an error on that I would expect it to be taken account of, but the difference would not be much in the cost. In freezing weather it would make a difference in the temperature of the gas. In this climate a gas pipe ought to be buried at least two feet at all points. For certain safety it ought to be lower than that. While 2½ feet is pretty safe, 2½ feet would be the average of safety in practical engineering. We have short spells of very severe weather in this climate. In my construction work I have never dug a ditch 2½ feet deep and only 12 inches where men are expected to work. It is possible to be done, but it is not practicable or sufficient in ordinary construction work.

137 Sixteen inches is plenty wide for that depth for small pipe. I only allowed the cost of a twelve inch ditch for services in cutting through asphalt.

On exhibit 105 I allowed twelve inches for services under asphaltum and cedar blocks, brick eighteen inches. I have seen trenches 2½ feet deep constructed for this sort of work, but I would say that would not be a proper way to open up a ditch. I have never laid any gas pipe. I have done considerable sewer work and considerable ditch work. For the sewer work we used vitrified tile pipe. I superintended the work and did the engineering and ran the men and attended to the pipe laying and the building of the man holes and the job complete. We usually did that work by sections. The digging would run all the way from five to fourteen and fifteen feet deep. Of course it makes a good deal of difference. The deeper the trench, the more proportionately it will cost. The dirt has to be raised higher and the efficiency of the laborer, who is in a cramped place is necessarily lessened. Some of these mains in this city are down pretty far in places. I could not say whether any of them are down twelve and fourteen feet or not. I did not allow anything for large mains at any such depth. I know in a general way the condition of the soil which the mains from the works up town traverse. I did not figure that it was necessary to dig the ditches low enough so the pipe would rest beneath the influence of surface water. I did not know whether gas mains were down that deep in the bottom at the plant. I have not endeavored in this work to make my figures as favorable to the city's cause as I conscientiously could. I believe I have made errors against the city's interest in this figuring, for instance, I think a great many of the services are put in without the taking up of a foot of street and undoubtedly it cheapens the cost under a lot of this pavement. I am endeavoring here to figure the replacement cost against the gas company's engineers' figures.

You could put in new services without opening the streets by boring. You would have to go down at each end and to connect,

but you would not have to take up the entire distance of an
138 asphaltum street. You would have to make a manhole or something first anyhow. You would have to have room to make your taps at the main and you would have to be prepared at the other side to make your connection through and you would have to have a place for the auger. I know they do that in the streets here in Lincoln. The gas company seems to do it successfully. They do it at least. They put in a service down on my own lot. They crossed under a thirty foot pavement and never took up a shovelful. The gas company did that with their own men. The service did not come from the church and run down a trench outside of the pavement. I believe I am pretty well posted about that. They crossed under the pavement, 30 feet wide, without taking up a yard of paving. I was right there on the ground at the time. David Saul was the foreman on that work. That was done in August or September last year. The church is there on my side of the street too. If they came from the church they would not be required to go under the pavement. I know positively that they did not connect my service up from the church service. There was no intention to err either way. The object, so far as I was concerned, was to be as fair in this matter as I knew. On every item in this replacement I can not vouch for my ability in making a practical estimate here. If I were to figure this over again, after this cross examination, in the interest of fairness, I would put those services a little lower in the ground and increase the cost.

Redirect examination by Mr. Stewart:

In digging of a trench, six inches deeper would not add very much of an item in dollars, to the cost of digging. Making the additional allowance, I think these figures would cover the cost of new construction to the present time. Last year labor was $2.00 per day for an eight hour day instead of $1.75 as it is now. Back ten or twelve years ago you could get first class labor for $1.50 per day for eight
hours. For the past six years you would have to pay all the
139 way from $1.75 to $2.25 for digging. The city pays for common labor $1.75 for eight hours a day, which is the same labor that is required to do this class of digging. The alleys of the city are not as generally paved as the streets. The alleys are principally paved in the heart of the city in the business section and generally through the city the alleys are not paved.

140 J. M. DIFFENBAUGH, being first duly sworn testified on behalf of the defendant as follows: Pages 298 to 324 printed record.

Direct examination by Mr. Stewart:

I live in Lincoln and have lived there for about 22 years. My present occupation is contracting and building sewers in this city. I have been in that business for six or seven months. Previous to that I was water commissioner in this city for three years. Prior

to that I was an employee in the water department. My work in the water department was mostly construction of mains and involved the digging of ditches and laying of cast iron mains. I do not know that this work differs in any way from the laying of gas mains, except that with the gas pipe you have to lay to drip. The work would be the same so far as the laying of the pipe and the labor is concerned. I was in that work about 20 years. I used to employ the labor for this construction work and the city generally bought the materials. The materials were under my supervision. I am acquainted at the present time with the price of such labor that is required for the digging of ditches and laying water mains and I am in a general way acquainted with the market value of the gas mains and the materials that enter into the construction of gas mains and services in this city. I have made an estimate and can state the reasonable cost in value of the labor and material that would be required to replace the gas mains and services of the Lincoln Gas & Electric Light Company in this city. Exhibit 106 is my estimate. It is a correct estimate and shows the reasonable cost.

Exhibit 106 is offered in evidence.

On the four inch pipe I base the actual cost of the material and labor at 52¢ per running foot to complete the job. I figure that pipe at 19 pounds to the foot and $33.00 per ton, for four inch cast iron pipe. For the two inch wrought iron pipe, I figure 21 cents a running foot for the laying of the pipe, exclusive of the paving.

The price of the pipe is 11 6/10¢ per running foot. That is
141 the market value quoted to me at this time. I got the quotations from the Western Supply Company, wholesale dealers in plumbers supplies and pipe. That is what it is worth in the market here and what is quoted to me. I figured cartage $500.00 for the drayage and hauling of this two inch pipe; the extras that there would be fitting along the line, etc., I figured at $1,000.00, and the labor at 9¢ per running foot, that is, for digging the trench, back filling and laying the pipe. That would be for a fifteen to an eighteen inch trench 3½ feet deep for the mains. That would cover the cost of laying the two inch pipe. On the four inch pipe I figure all of the pipe of course on the basis of $33.00 per ton. It can be bought today for a little less. I figured the lead at 5¢. I am informed today it can be bought for 4¢ per pound. I figured the cartage at 50¢ per ton. That covers all of the pipe. I figured 3¢ for extras, something that generally goes in. We might not use it, but for instance, there might be a drip or something like that to go into the mains. That makes 3¢ extra per foot. I am not familiar with where they are located and I could not tell, but there might be something special to put in, in that line. On the six inch pipe I figured 2¢ more for laying. They are a little heavier to handle. In all other respects it would be the same. On the eight inch pipe I figured the labor at eighteen cents on account of it being a little heavier to handle the pipe. On the ten inch pipe I figured 22¢ for the labor; on the twelve inch pipe 25¢; on the sixteen inch pipe 35¢; on the twenty inch pipe 40¢. Of course for the twenty inch pipe or any pipe over six inches, can be bought for probably $1.00

less than the smaller size pipe, but I figured on the basis of the smaller pipe, that is, $33.00 per ton. Pipe varies so much it is hard to keep track of it. From my experience in laying pipt I would say that these figures I have given would be adequate to cover the cost of reconstruction today. Sometimes the cost is more and sometimes it is less.

142 I have been familiar with the price of labor and material for the past 20 years. I can not recall them now. The cost has varied considerable, from $18.00 to $40.00 per ton. The cost of labor has varied probably in the same proportion. The cost of labor has never been higher than it was this last year. It was extraordinarily high. I don't know how deep on the average, the gas company lays its mains. Some of them are very shallow and some of them are deep, but perhaps they would average three feet. I should judge wherever we ran across them in the line of the work we have done, and we run across them frequently in laying water mains and sewer pipe, the depth of their services varies considerably too. It is hard to tell how deep they average, but I would say about three feet.

I can get all the labor I want for 20¢ an hour, and you can get it too for 17¢ an hour. Last fall the ruling price was from 20¢ to 25¢. Prior to that time the price for diggers was from 12½¢ to 15¢ and 17½¢. I don't know that the work of making the joints requires any special skill only screwing the pipe together. These connections in gas mains are made similar to the connections in water mains. The pipe for both water and gas mains are joined with lead joints. They are laid, yarned and calked for them to pour the lead in and that causes the joint. The services I estimate at $9.00 a piece. I figured services 50 feet in length of 1¼ inch pipe at 7¼¢ per foot. I figured the gas cock at 78¢ and the stop box at 72¢. I believe they quoted me that and the labor. I allow $3.00 for the labor, 50¢ for the cartage, 37¢ for extras. You want a nipple and L when you make the connection and a tap most generally on a two inch pipe. I made an estimate on extras on a two inch pipe for that much. From my knowledge and experience of the reasonable value of these items I would say that this is sufficient to cover the cost.

I have made an estimate of the cost of taking up and replacing paving. For the service I figured a ditch three feet deep. I am not acquainted with the depth that the gas company lays its service pipe in this city, but I do not think it would average more than 2½ feet.

143 I do not know exactly what depth they use. I have examined them and seen them while we were doing construction work and I do not think they would average over 2½ feet. On the mains under the wooden blocks I figure 33¢. That is the average for a main two inches up to ten inches. I figured 11,300 lineal feet under wooden blocks. I don't know of any wooden blocks in this city now. I figured 72 services under the wooden blocks at 22¢. These figures include the taking up of the blocks, provided they were there and replacing them and also taking up the concrete and replacing it. On the wooden blocks pavement I figured on opening a ditch

12 inches at the top and 18 inches, for the mains. You can work in a 12 inch ditch, provided you do not go down any deeper than you do for a service. On the two course brick I figured 6¢ per foot with extra labor and figured on replacing the same material. When you take the pavement out it helps on the digging. There is nearly a foot that you do not have to excavate, and in consideration of that and the fact that the materials would be replaced, I figured that 6¢ per lineal foot would be a reasonable price and on services under two course brick I figured the same. On the asphalt I figured 58 1/3¢ per foot for 49,100 lineal feet of mains. I figured on a trench 18 inches and labor and material makes up that cost. I do not figure on saving any of this material. That has to be replaced with new material. Neither have I made any allowance there for boring. On the 17,080 lineal feet of services under asphaltum, I figured at 38¢ a foot. I figured on opening a trench on this asphalt about 12 inches wide for the shallow ditch that we have to put in. You might have to make it a little wider if you had to dig a deeper ditch, especially at the point where you make the connection. I have had actual experience in this work of taking up pavement and laying it back, in connection with the waterworks and sewers and my figures are taken from my actual experience. Taking it as a whole I think these figures are the reasonable cost for doing all of this work. I have allowed nothing for profits but superintending can be done under this estimate.

144 I have averaged all of the work and aimed to put in enough to cover the superintending. In the services you might save considerable by boring, if you bore five feet on each service, if you had the trench open six or eight feet, the condition would tell you what to do and in that way you would save all of the paving and all of the trenching. My figures are based on actually taking up all of the pavement and replacing it over the mains and services. My observation has been that water pipe in Lincoln is affected in some places by electrolysis, especially along the car tracks and along and around the power house. There has not been any considerable amount of pipe affected that way during my twenty years of experience. The only difference in that respect between water mains and gas mains is that the water mains are coated with a composition of asphalt dope and the gas mains are not unless specially ordered. It has been several years since I saw mains affected by electrolysis. They have helped that by bonding some of the mains down by the power house. To make a connection they tie a wire around the main and run it back to the power plant. I have not seen any mains affected that way lately, but I have within the last three or four or five years. They bonded them possibly ten years ago. I have forgotten how long ago it was they first noticed the trouble. I have never taken any mains out on that account. It was not so bad that we had to. We made connections at the very dangerous points, at the power house, and I believe some of the gas mains and water mains are bonded now. I have not seen any bad effects from electrolysis of recent years at any place except near the power house. We have traced through to it but they have

laid lots of it to where the services gave out frequently. They have laid electrolysis to the giving out of the water services frequently. The alkali soil, I have observed, has a detrimental effect on the water services. We found that in places they only last a few years and in other places they last a good many years. I have not observed any effect on the mains.

145 Cross-examination by Mr. Rose:

The tapper in the water department is the man who makes taps to turn off and on the water in a general way. I commenced in the water department as a laborer and worked up. I was a laborer until about 1891. I received from $1.75 to $2.00 per day. I became a tapper I think in 1898. Between 1891 and 1898 I was foreman of the construction and received $65.00 per month. As tapper I received $70.00 per month. During that time I worked under the supervision of the water commissioner. Most of the time until recent years the water commissioner has been appointed by the Mayor. The water commissioners whom I served under were Mr. Lyman, Mr. Bullock, Mr. Percival, Mr. Byers, and Mr. Tyler. The highest wages I ever received in the water department up to the time I was elected water commissioner, were $75.00 per month. I never was an accountant or an engineer and have never had any extended experience along those lines. I made the calculations shown on Exhibit 106 and they are the best calculations I can make. If I had the contract to do this work perhaps I could extend these items more accurately than they appear, but I speak for the accuracy of these items. The item of $142,866.54 on this Exhibit is a correct addition of the items in the column above, perhaps it will vary some, something like a few cents. We are all liable to make mistakes. I did not spend a great deal of time on this table. I compiled it myself. I have not had any engineering education. I used to think I had a good common school education, but I have not had any technical education in these things. I became water commissioner in 1904 and retired in May, 1907. During that time I think we constructed more than two miles of main, but I would not say that it was more than five miles. The number of men we had in that department varied at different times. Mr. Traxell was the accountant in the office at that time. Since retiring from the water commissioner's office I have been doing contract work. The largest contract that I ever undertook
146 was possibly about $1,500.00. That was building a sanitary sewer. It was done under the supervision of the city of Lincoln and I made my contract with it. It was located over in the sixth ward. We had to cross the pavement on Sumner street and 25th and on the alley between 24th and 25th on Sumner street. They were asphalt. The city charged me up for replacing the asphaltum and I closed the concrete pavement. I kept an accurate account of the labor employed in cutting across the streets. In crossing the pavement at 25th and Sumner I had one man to cut the asphaltum. He cut through the asphaltum, the binder and

the concrete. I think the concrete was four inches and I believe the binder was 2 inches and the asphaltum 2 inches, making in all about ten inches, but I am not positive. He opened it with a pick and an axe. He used the axe to cut the line through the asphalt, the top dressing and he used the pick on the binder and in the concrete. It took just three hours to cut a hole through, eight feet long by two feet wide. We did not cut clear across the street. He cut two holes in the pavement and tunneled the balance and I paid him 25¢ an hour for the time that it took to cut through the paving down to the dirt. I took notes at the time and from actual memory I noted that at the time. I will recall the name of the man in a little while, probably, that I paid 25¢ an hour for doing this work in three hours.

I have had eight contracts with the city of Lincoln and in addition I have sewer and water contracts in east Lincoln and southeast Lincoln. One was for L. J. Dunn, another for Mr. Orr. Mr. Dunn's was water to his private residence. Mr. Orr's was sewer. Mr. Orr's contract was less than $100.00. This is the extent of my experience in contracting. I don't remember how far I ran the sewer for Mr. Orr. I ran from the house down to the alley and down the alley for perhaps 200 or 300 feet. In the last six months I have been a somewhat extensive employer of labor. Sometimes I had a dozen and sometimes as many an thirty men. I can not tell you how many they would average. In our
147 business we take up and lay off men as we need them. My work is not continuous. Mr. Bing assisted me in making out the tabulation on the asphaltum. We went over it after it had been made out, and compared with each other the cost of services and the labor. I did not change my estimates any. I do not know whether we correspond or not. I estimated $3.00 for labor for a trench three feet deep.

During the giving of my testimony I had a memorandum of the details that I pulled out and used. I was present here during all of Mr. Bing's testimony. In my employment here no price was stated and nothing said about it. Mr. Stewart asked me to do it. I expect to receive something for it, but nothing was said about the price. On two inch pipe, gas cocks and stop boxes and one and one-fourth inch pipe I got quotations from the Western Supply Company. I got a higher quotation from them on the four inch pipe which I declined to use, because I could buy it cheaper. The quotations on four inch cast iron pipe are considerably higher than they were in 1905 and 1906. Six inch cast iron pipe can not be purchased in Lincoln today for less than $40.00 a ton. I am not posted in Lincoln, but I am posted on the factory prices plus the freight. I am not an electrician but I have read considerable of the action of electricity upon cast iron and wrought iron pipe, but not far enough to be an expert on it. I have read a good many scientific papers. I can not tell you now what they were. It would be worth considerable money to a man who could devise a method to prevent against electrolysis. I do not know of any way to entirely prevent it. I do not know whether or not

there have been any extensive lines of gas mains that were necessarily taken up on account of electrolysis, by the gas company here. Water pipe as it is manufactured, is dipped in a solution. That was not done to protect the pipe from electrolysis. It was done long before they ever knew anything about electrolysis. The solution protects the pipe from the soil. The coating is not an electricity conductor, but so far as I know it does not afford
148 a sort of an insulation. The water pipes are laid to carry water and the water pipes of the city are filled with water most of the time. Water is a conductor of electricity. Gas pipes instead of carrying water carry gas. I don't know whether gas is a good conductor of electricity or not and I don't know whether the gas or water mains are most liable to electrolysis or be affected by it. I do not know whether the experience with water mains furnishes any criterion at all for gas mains, in that respect I don't pretend to know.

My price of $33.00 a ton for cast iron pipe was secured out of the Municipal and Engineering News. I have several quotations. They give q*h*otations every week. That is a journal devoted to the interests of the municipal ownership on all subjects. It is published in New York, I forget who is the publisher. The rate I quoted on four inch pipe is the same they quoted on twenty inch pipe. I think twenty inch pipe is $2.00 less, but I gave a price of $33.00 per ton for all sizes to make it safe and I gave the gas company the benefit of the doubt. I think that I can get four inch cast iron pipe delivered in Lincoln today for $33.00. The price fluctuates considerably but I could have done that in the last six months. I could have had it from the United States Cast Iron Pipe Company and the American Pipe Company of Birmingham, Alabama, and I can produce quotations from that company within the last six months. I had the quotations the other day, but I don't know what I have done with them. The car rate from Birmingham here used to be $5.10 per ton. That is what we always paid when we bought our pipe and I added that to the quotations and still kept within the $33.00. I think the quotation is as low as $24.00 for twenty inch pipe. $26.00 was the highest with one dollar extra for gas pipe. I would not use the quotations of the Western Supply Company on cast iron pipe, because I think I can buy it as cheap as they can. When I am in business I buy where I can buy it cheapest. They ought to know where to buy as low as I can. They are in the business and I think I can get the market quotations as low as they can on cast iron pipe with my stand-
149 ing and knowledge as a contractor. I deal at present quite extensively with the Western Supply Co. I asked them the price and they took two or three days to look it up. They also quoted me the cast iron. I do not now remember the name of the man who cut the asphaltum on the 24th and Sumner in three hours.

Redirect examination by Mr. Stewart:

His name is Frank Watson. I found electrolysis on the city water mains around the power house mostly. There seems to be

a misunderstanding and of course I can't tell when that took place, but you can find indications of it at any time, and can now.

Recross-examination by Mr. Rose:

Electrolysis will pit cast iron pipe, where it leaves the main and make a hole in it. It forms a crust and under the crust you will find it pitted. I don't know whether electricity eats or decomposes the iron. I am not an expert although I know they claim that where we find the pipes pitted that electrolysis does it.

Redirect examination by Mr. Stewart:

Exhibits 107 and 108 are quotations of the gas pipes taken from the Municipal Journal and Engineering News, a trade journal, devoted to municipal and private contracts that they can get trace of. I think I have the papers that these quotations were clipped from. I will bring them here if I can find them. One is dated April 12th, and the other is a week previous, 1908. I think it is a reliable journal circulated among contractors and trades people. Exhibit 107 and Exhibit 108 offered and received in evidence.

Recross-examination by Mr. Rose:

I do not know where Frank Watson is now. He worked for me considerably last winter. I can not tell when I last saw him, but I think it was along the fore part of April of this year.
150 I think he is a married man, but I don't know where he lived at that time, but I think they lived in Lincoln. This municipal journal does not, that I know of, deal in pipe or receive and fill orders for pipe. I do not know what the financial responsibility is. If I were ordering pipe I would not order it from this journal. We have no guarantee at all that they would make their quotations good. This journal is published in the Flat Iron Building, New York City. I can not tell you what the rate of pipe per ton is from New York City to Lincoln. This journal is published weekly. It is devoted mostly in the interests of the contractors and of municipal ownership and everything pertaining to municipal affairs. If I were to make a contract I would investigate the quotations a little further by inquiring of the foundry but I think they are very reliable. The United States Cast Iron Pipe & Foundry Company is the largest dealer in cast iron pipe in this country. I- has its headquarters in New York City and has a foundry at Birmingham. They have a string of foundries all over the country. The quotations of that company at the foundry, with the tariff rates added to Lincoln would give the correct price and give the price that a contractor at any particular time would be obliged to pay, unless he took a large supply, then he could probably get it for less, but you could get a quotation on a large supply.

If Mr. Malone made his figures on that basis, I think it would be right. Frank Watson was just a laborer. I think last year he worked for the Beatrice Creamery Company. That is my impression.

Redirect examination by Mr. Stewart:

I have followed the quotations of cast iron pipe in this trade journal and have found them reliable. This shows the quotations at Birmingham and I figured on that plus the freight. The freight from Birmingham here was $5.10. That is what we used to pay.

151 LOUIS JENSEN, being first duly sworn, testified on behalf of the defendant as follows: Pages 324 to 328 printed record.

Direct examination by Mr. Stewart:

I reside in Lincoln, Nebraska, and have lived here since 1878. I am a building contractor and have been engaged in that business in this city since 1884. I do the complete work from the excavation up, stone work, brick work and all the branches of building. The qualifications of the witness as a builder of brick and stone structures is admitted. I have examined the buildings of the Lincoln Gas & Electric Light Company in this city with a view to making an estimate of replacing them. I did that yesterday. I am prepared now and can give an estimate of the replacement value of these buildings and of the labor and material that enters into their reconstruction. In company with Mr. James Tyler Sr. the water commissioner and architect, we measured the present buildings and found the present value of all the buildings is $39,934.00. One building was $10,395.00. The center building was $15,047.00. The west building we estimated at $6,550.00 and the two story part of the west building $1,092.00. A coal shed $2,000.00, an oil house $500.00, an electric motor house, it was a small house on the northeast at $650.00, two chimneys, one steel and one brick, $3,700.00. We found that the east building had depreciated 25% making its present value $77,961.00; the center building had depreciated 30% making its present value $10,532.97; the west building was depreciated 30% making its present value $4,585.00; the two story addition there was no depreciation. The coal shed had depreciated 50% making its present value $1,000.00; the oil house had depreciated 40% making its present value $300.00; the electric motor house had depreciated 20% making its present value $520.00; the chimneys had depreciated 15% making their present value $3,145.00. The total present value was $28,970.97. In the first figures which I gave as the replacement value I included in them the contractor's profit and I would be willing to take a contract to replace them at those figures.

152 Cross-examination by Mr. Rose:

You could not very well take a contract to replace them in their present shape. Some of them are about fallen down and you could not construct them the way they are. Some of them are pretty shaky. They have depreciated so much they are cracked in many places and they do not seem to have been kept up very well. It looks to me as though some of them will require the cost of replac-

ing them at an early date. The roof seemed to be all right. It seemed to be the walls. They were lightly constructed nine inch walls and there is a kind of a soft foundation down there. I presume they have settled and cracked. That was the main thing. I do not know how deep the footings are. We could not tell from the house. Some of them projected up above the ground. I have had no experience in excavating in that particular locality and I do not know how deep the footings are for a big chimney. On figuring on a contract of approximately $40,000.00 involving as many buildings as there are there, I would go more into details. I estimated one of those buildings and found that the cost would be about $8,000.00. We put it at $10,000.00. Mr. Tyler was there with me and we consulted with regard to the cost at the present time and so we put it a little higher. In other words he put it at 6¢ per cubic foot. That class of buildings are sometimes estimated at from seven to sixteen cents per cubic foot and he rather thought that this class of buildings should be estimated at about six cents and so I yielded and set that price on it. I ran out and estimated the materials in the various walls and the cost of the labor per thousand feet of brick and the like of that on the first building. I designated that No. 1 and I found the estimated cost of that would be about $8,000.00. We put it at $10,395.00 on account of putting it at 6¢ per cubic foot. I estimated the material used because that was the hardest thing to get out and found what it would cost. That was the item of $2,000.00. Aside from those two items I did not attempt to go into it all in detail, the time I had would not permit me to
153 run out the details and to reduce the work to details so I could figure with absolute accuracy. All of the buildings being of the same nature we based it on this 6¢ per cubic foot. The buildings are not all identical. They are a little different. We did not estimate the receptacles for tar that are excavated into the ground. We just estimated the buildings. I could replace the two parts of the west building for $7,642.00 which is the sum of my estimate on the two parts. The west building is just a large room. I- has a west wall then the north and south walls, then a flat roof on posts. The $1,000.00 building was new. That was 20 by 29 and 29 feet high. That is including the basement. There are very few brick in it. There is only three nine inch walls. Last year when brick masons were scarce I paid 67¢. The highest wages were 67½¢. The scale is about 55¢ this year.

Redirect examination by Mr. Stewart:

The scale was the same last year but we had to raise it because of the scarcity of brick layers. The coal shed is in the worst condition.

154 H. S. WIGGINS, being first duly sworn, testified on behalf of the defendant as follows: Pages 333 to 340 printed record.

Direct examination by Mr. Stewart:

I live in Lincoln and have lived there for the last nine or ten years. I am a public accountant and have been engaged in that

business in Lincoln during all of this time. Prior to that time I was a railroad accountant. I have been in that business altogether between twenty and twenty-five years. I have examined the books and accounts of the Lincoln Gas & Electric Light Company, plaintiff in this case. I have done that in the last three or four weeks. Any tabulations that I have made of the receipts and expenses of the gas company, have been made from the books known as the yearly gas account. I have also examined in this connection, what is known as the accountant's table, with ledgers that show the segregation of the expenses. The gas report for the years 1902 to 1907 inclusive, will be needed. I have made an analysis of these accounts and comparative statements. I have them with me. Exhibit 117 shows the expenses or the cost of material and expenses of making coal gas for the years 1905, 1906 and 1907. Exhibit 118 shows the cost of material and expenses of making water gas for the same years. Exhibit 119 shows the cost of the mixed gas on the basis of the amount sold, for the same years. Exhibit 120 is my recapitulation of the gas made, the gas sold and the gas used by the company and the gas unaccounted for, for the years 1902 to 1907 inclusive. Exhibit 121 is comparative ratios showing the comparison in various items of cost and expenses for the years 1905, 1906 and 1907 with the results for the year- 1906 and 1907 being compared wtih the results for the year 1905. Exhibit 122 is a comparative statement of gas sales, expenses and net earnings for the years 1902 to 1907 inclusive, showing sales, price per thousand and net earnings. Exhibit 123 is a summary of the twelve months for the year ending December 21, 1902 of the expenses of the gas department, also a summary of the earnings. Exhibit 124 is a report by
155 months for the year 1903 also a summary in the back of the book for the entire twelve months. Exhibit 125 is a report of expenses and earnings of the gas department by months for the year 1904 also a summary in the back part for the entire twelve months. Exhibit 126 is a report of the earnings and expenses of the gas department for the twelve months of the year 1905. The summary for the year 1905 is in a separate statement. Exhibit 127 is a summary of the earnings and expenses of the gas department for the year 1905. Exhibit 128 is the report of the earnings and expenses of the gas department for the twelve months of 1906. That does not include the summary. That is mentioned in another Exhibit. Exhibit 101 is a statement of the earnings and expenses of the gas department by months for the year 1907, also a summary in the back for the entire year. Exhibit- 117 to 122 inclusive are compiled by me exactly as they appear in the books of the gas company, which have been identified as Exhibits 123 to 128 inclusive and Exhibit 101.

Exhibits 117 to 122 inclusive offered and received in evidence.

All of them are taken directly from the books except Exhibit 121 which is my own compilation based on these reports. They are correct calculations to the best of my knowledge and belief. From the original vouchers and invoices the company paid the Pittsburgh Coal Co. in 1906 for Yououghery coal, $5.40. In 1907 the average

price paid was $5.46 ⅔ per ton. In 1906 some of the coal cost $5.70, $5.75 and $5.85. Part of the time the regular contract price was $5.375 and part $5.20. The average price paid at Lincoln that year was $5.40 on the cars. That didn't include the cost of unloading it. I have not computed this cost on the cost of unloading and handling per ton.

Cross-examination by Mr. Rose:

I omitted the expenses for making coal gas in the years 1902, 1903 and 1904 in Exhibit 117 for the purpose of simplifying the matter and avoided covering such a long period of time. In the summaries in Exhibits 122 and 123 I included those years because the cost of gas was different and it was decided to show the amount the gas sold for, for a longer period of time than we cared to go into
156 in the Exhibit. We did not think we could make a point by this item in those years and carry that item and omit the same years in the other general summaries, because they could not serve the city. The reason was to show the effect on the net earnings of the reduction in price from the year 1902 down until it reached the rate of $1.20. I do not think, so far as any point goes, that the expenses of 1902, 1903 and 1904 would be very material. The fact that the cost of manufacturing and delivering during those years was decreased, would in a measure compel a reduction in price, and the schedules as to the station cost of manufacturing and delivering gas to the holder would be interesting date, but I don't know what bearing it would have on the analysis of the reduction as compared against the net profits on the business for different years. I do not know so I can not tell you. The decrease in the cost of manufacturing and delivering the gas itself to the holder, might be so great as to entirely compensate the reduction in charge.

These schedules were included in Exhibits 119 and 122 and excluded from the others for those years because it was not desirable to encumber the records of the Exhibits with a great mass of figures. In excluding the items for those years I did not take into account the fact that the station cost of gas had decreased. That element did not enter into it. I did some work on this last October and at intervals since I have applied to the company for access to its books and records and I have been given full access, consistent with convenience of the company in administering its own business and I have checked out and approved in a measure the accounts of the company. From my examination of the books I would say that the methods of accounting employed by the company seem to be fairly accurate and conscientious. Such mistakes as I found were such as I might expect to find in any set of books. I found nothing to indicate any effort during any of those years of a manipulation of the books or anything of that sort. So far as my examination goes I would say that the company has attempted at least, to keep an honest and fair record of its business transactions and after
157 checking them out I would feel justified from relying upon the general summaries, in exhibiting the business in a summarized form.

On the third sheet of Exhibit 119 I have shown the distribution expenses and collection expenses of the mixed gas. I did not take anything into account for interest on the investment. I followed the method of accounting used by the company and I did not take anything into account for the item of depreciation. The company in its system of accounting does not enter up these items as a part of the distribution expenses. I think it would be good accounting to apportion what is regarded as a reasonable rate on the necessary investment, partly to the cost of manufacturing and partly to the cost of distribution, in order to get the ultimate results. Whether or not a certain portion of the item of depreciation should also be charged to the cost of manufacturing and another portion to the cost of distribution, is a matter resting largely in the discretion of the management. The company does make a charge of $1,000.00 a month for depreciation under the head of reconstruction reserves. That is on both the electric and gas plants. Now as to whether that should be charged partly to manufacturing and partly to distribution and to the elements of expenses is simply a matter of detail. It is not a matter I would pretend to answer authoritatively. As an accountant I think this reconstruction reserve and the charge for depreciation would amount to one and the same thing. I did not make any inquiry as to that. The reconstruction reserve account amounts to about $7,000.00 a year on the gas plant.

Redirect examination by Mr. Stewart:

The company began to charge off this $1,000.00 per month for reconstruction in January 1906 and has continued it up to this time. Of the electric department, the gross earnings for the year 1904 were $77,958.90. Total expenses $52,911.26. Net earnings $25,047.64.

158 For 1905 the gross earnings were $91,052.62; Expenses $57,467.42. Net earnings $33,585.20. For 1906 the gross earnings were $116,565.25; expenses $77,677.88, net earnings $38,587.35. For 1907 gross earnings were $136,439.55, expenses $96,646.31, net earnings $39,793.34. I have the construction account of this company identified as Exhibit E at the former hearing.

H. S. Wiggins, recalled for further examination testified on behalf of the defendant as follows: Pages 341 to 353 printed record.

Direct examination by Mr. Stewart:

I checked this construction account through the books of the company from the beginning. It was originally started 1872 to 1873. This states 1873, but I think the first work was done in 1872. It was usually headed in the various books that were kept as "Gas Construction." The initial cost of the plant as shown by these books was $53,700.00. It was paid in stock of the company, and was the contract price. I found a duplication in it. The entire construction payment for the year 1900 was also included in the statement of construction for 1901, making a difference of $22,538.00. That dupli-

cation was in Mr. Honeywell's statement. In it also there is an item for the year 1892 commission on 333 bonds sold, $16,397.53. Expenses on bond $1,618.31. The year shown on page 11 referring to the labor account as I recall it, shows that there was a little labor appearing in the gas manufacturing department and the labor that appears to be charged to construction account seems excessively heavy. I found for instance, items of $705.00, $289.00, $541.00, $304.00, $1,308.00, $176.00, $483.00, $156.00 and $498.00 appearing as I recall, weekly wages to men and the way they were carried through the books. I failed to find where much labor was charged to manufacturing or expenses and there is a very large charge for construction made during that period. Also at frequent intervals in this construction account there were charges of attorneys' fees.

159 Also on page 26 I found a charge of La Clade Fire Brick Company of $3,215.00 and another of $513.38 which seemed to be charged for cupola brick in the construction of benches. I have no means of knowing whether that was rebuilding benches or original installation of benches and on page 37 for the year 1899 I find an entry of La Clade Fire Brick Manufacturing Company $865.80 for two benches of 6's. I could not say whether it was rebuilding the benches or original installation of benches. This construction account was running through the various ledgers. They are not in evidence and have not been identified here. I have examined the books of the company in regard to the stock issue on December 31, 1892. That is found in journal B page 161 December 31, 1892, and shows an entry of capital stock issued $500,000.00 and the books do not show that anything was received for that stock. And in 1897 the books show an additional issue of stock of $450,000.00 and a bond dividend of $165,000.00. According to the books the company did not receive any consideration for that issue of stock and bonds. It is charged against profit and loss in Journal B page 410.

Cross-examination by Mr. Rose:

There were some other expenses aside from the naked contract price of the original construction and these outside expenses would run up the construction account from 1873 to the figure that Mr. Honeywell gave. I ascertained this duplication for the years 1901 and 1902 by checking over the books. As I recall it they had changed from one set of books to another and in changing they brought forward the entire amount paid for the construction in the previous year so that at the end of the year 1901 the amount of the construction represented two years' business on the back books and the amount on the books represented two years' expenditure and Mr. Honeywell very naturally followed the items and had taken off the previous year item by item. The examination of the books will disclose what the error was and it is a very natural error. I

160 would not say that the commission on the sale of bonds used for construction was not properly charged to construction expenses. The other expenses of the bond for lithographing and attorneys' fees and getting up the abstract of the corporation, would be properly chargeable to the construction account, but would have no

bearing whatever on the replacement value or anything of that kind. I understand that replacement value means what would replace it if you had the money to pay for it. I can not say positively that the manufacturing cost and labor in 1888 was carried into the construction account, but I saw some indications from the general value of the account, that indicated that that might have been done. The reasonable charges for attorneys' fees for drawing contracts and taking care of the contractor's suit and things like that would be a proper charge on the construction account, and those things might be incidental to the construction of a plant of this size, and would probably be considered the same as the cost of the physical properties, especially if the incidental expenses were incurred on an account incident to construction. These contingencies do arise, enter into and form a part of the cost of the physical properties.

The item of the La Clade Fire Brick Company for $3,215.00 on page 26 of Mr. Honeywell's report for fire brick, I think was the contract price for benches as I recall, and I would not say but that that was additional benches constructed under contract. Lot 79 might have been acquired by the company as late as 1890. I don't know when they acquired Block 83 which the Lincoln Electric Light Company formerly owned. I do not know whether they acquired some additional properties in the vicinity of the gas plant, to prevent being crowded and for storage room and future expansion. The item of $200.00 for taxes charged to construction is the only item of taxes in the construction account. If the company had purchased a lot and used it in its construction work that was subject to a tax lien of $200.00 and had they discharged that tax lien that item might very properly enter into the construction account. I have not examined the details to see whether or not there was an item of that kind and I would say, in respect to these old matters back in
161 1898, 1899 and 1890 that I didn't think Mr. Honeywell or anyone else connected with the company, has any very definite knowledge as to what those items were for. I have not seen anything to indicate but what the charges were proper enough. From all of these items that you have run over here, I find no charge in the construction account, but what appears on the fact of the record to be legitimate, especially the more important items. There were some items of payment to Mr. Van Ripen and Mr. Mullen and to others that I could not understand, that would be charged to construction but I could not say that they were wrong and there is no one here that can offer any explanation except just what is shown on the books. The original vouchers might show, if we could get back to that. I cannot give you the exact date the company acquired the old electric light company.

The books that I have examined include the books of the original Lincoln Gas Company and the gas company as amended in 1900 and the Lincoln Gas & Electric Company, the predecessor of this company. The transactions with respect to the entries of stock were the transactions of the company which the present company has succe-ded. The last issue of stock and bonds, $15,000.00, was in the nature of a stock dividend. The others just seemed to have been

additional issue of stock without any apparent reason. I could not say positively whether these two items $500,000.00 and $450,000.00 represent the total stock issued in the entire history of the old Lincoln Gas Company. It is not made clear on the books that the $500,000.00 stock issued in 1902 was paid to the former owners for the original stock, which was retired. If that is the case I could not say and do not know. There is no extension of that character noted on the books. I have examined back as far as 1892 up to the time the Lincoln Gas & Electric Company sold to Wood & Havemeyer and the total outstanding stock issue at that time was $950,000.00 and no more. I would not say that this issue of $500,000.00 in 1892 represents all the money at that time invested in the company.

162 It represented more than there had been put into the company. There is in the books no record of retirement of old stock contemporaneously with the issuance of the half million of stock. There might be in the minutes of the company somewhere, but I don't find any such entry on the back books. I have not examined to ascertain whether the issuance of $450,000.00 was authorized. When I gave the item of expense for the electrical department in 1904 I had access only to the electric light books for the space of one evening and did not go into the details of those expenses. I did not go into it far enough to ascertain whether the electric department's proportionate share of the bond interest was included in that. I don't think that it was. I think they followed the same method through all of the years that they did in the gas department. What I gave as the net earnings is just what the company gave, but I do not think they include bond interest. I could not say positively. They do not include any sum for depreciation.

Redirect examination by Mr. Stewart:

Exhibit 130 Journal B is the book containing the stock and bond entries which I have referred to. Page 410 of Exhibit 130 Journal B, beginning at "Undivided Profits" and continuing to the bottom of the page, is offered and received in evidence. I have examined the books of the gas company and its antecedents and up to June 1890 there was no cash contributed by the owners. I do not find that there was anything paid in. The original plant was paid for by a stock and bond issue up to June 1890. The books showing the amount of stock issued up to that time, to be $175,000.00. Of that amount $53,700.00 was issued for construction, but I do not find that there was any cash paid in. The books run right along up to that time regularly.

Redirect examination by Mr. Rose:

Beginning in 1890 the old plant was reconstructed and afterwards the Electric Light department added.

Redirect examination by Mr. Stewart:

163 Subsequent to June 1890 there has been added up to the present time $709,196.50 to the entire electric and gas plant.

In June 1890 there was an additional stock issue of $25,000.00. That was paid in notes and I think the notes were paid for. In September 1890 there was an additional issue of $12,100.00 which was paid in cash. In October 1890 there was an additional issue of $63,-344.00 which was paid for in cash and in notes and I take it that these notes were paid for. In 1891 and 1892 6% bonds were sold in the amount of $333,000.00. They received that amount less $16,-397.00, commissions and expenses. In 1901 there were $67,000.00 worth of Treasury bonds sold at a discount of 25% for which they received cash. In 1901 there was stock sold for $900.00. In 1902 and 1903 the holders of the Lincoln Gas & Electric Light Company 5% consolidated and 5% mortgage bonds, paid in $77,000.00 in cash. In 1901 and 1902 there were sold 5% consolidated bonds, in the Lincoln Gas & Electric Light Company, in the amount of $64,-000.00 which was the par value. In 1904 and 1905 the company borrowed on 6% notes $100,000.00 and eventually took up those notes and issued stock in payment of them. I guess the transaction took place a little earlier than that. It was at about that time. In 1907 the company borrowed $39,000.00 on two year collateral notes. Those notes are still outstanding. I have not traced in any way to know what became of it. I noticed in one case that the books state that $40,000.00 worth of bonds were issued or given out for the payment of interest coupons. I do not know what use was made of the remainder. I did not make any attempt to trace it. Those entries are found in cash book and Exhibit 131, Journal marked Exhibit 132 and ledger marked Exhibit 133, series A covering from March 1872 to June 1890. In cash book marked Exhibit 134 and journal marked Exhibit 135 and ledger marked Exhibit 136, being series B covering from June 1890 to December 31, 1897, series C, being cash book marked Exhibit 137, Journal marked Exhibit 138 and ledger marked Exhibit 139 and runs from January 1, 1898, to September 29, 1900. In Journal marked Exhibit 140 running from
164 October 1, 1900, to date, ledger marked Exhibit 141, running from October 1, 1900, to November 30, 1901, ledger marked Exhibit 142 No. 2, running from December 9, 1901, to December 31, 1905, and ledger marked 143 No. 3 running from January 1, 1906, to date. The outstanding accounts payable at the end of the year 1906 were about $35,000.00 and in 1907 about $50,000.00 and they run that throughout the year so far as I know.

Recross-examination by Mr. Rose:

That merely represents the unpaid accounts on that particular date and has no reference to the amount expended during the year. It showed that the company was using credit of $35,000.00 at the close of the year 1906 and $50,000.00 at the close of the year 1907. That is in addition to what was paid for equipment and machinery. These bills represent the amount that had been charged into the account. It is the material account or expense account or the stock account and had not been paid for. It did not represent all of the stock on hand, but it represented the unpaid portion of stock on hand. The ledger account for June 1890 shows outstanding stock

issued of $200,000.00. That, with the additional issue of $500,000.00 in 1892 and $450,000.00 in 1897 would make a total stock outstanding, if it was outstanding, of $1,150,000.00. In examining the books I did not pay so very much attention to the stock outstanding. At the close of 1892 the books showed $1,000,000.00 total stock outstanding; of that $50,000.00 was Treasury stock and had never been issued. The issue of $200,000.00 prior to June 1892 is not accounted for in the entry of $500,000.00 of that date, and in some way it is dropped out. It must have been retired in some way, but the books do not definitely show how. I think there is a recapitulation of the different summaries showing how much was actually paid out by the corporation in the construction of its plant up to June 1890. I don't mean to imply that the sum of $175,000.00 was all of the money expended by the company from its organi-
165 zation to June 1890 for the purpose of its construction. The construction in the earlier years was charged against revenue. That is, it was paid for out of earnings and was charged off every year and the surplus earnings of the company during those earlier years was used to improve the plant; and the surplus earnings since 1890 that have not been applied to bond interest, have been used entirely in bettering the plant. As I recall it now, up to 1887 all construction charges were written off yearly and went against the earnings and were paid for out of profits. Since that date I don't say there has been any direct charge of construction against revenue. There has been no stock dividend since May 1900.

The proceeds of $40,000.00 on bonds that were used to take up maturing and defaulted coupons, indicates that this resulted from the fact that earnings of the company had been necessarily used in bettering the company's property, is a conclusion that I am not sure that I can draw. From 1900 up to the present time, the books show a considerable sum charged to the construction account. The items that have gone into the Treasury aggregate about $760,000.00 subsequent to June 1890, representing the total receipts from the sources mentioned by me, including both electric and gas departments. Any surplus off of bond interest and operating and maintenance expenses since 1900 has not been paid out in dividends and they could not do otherwise than remain with the company and I think that it shows a natural deduction that they were absorbed in the betterment of the plant and showing the plant to have increased in value by the amount of surplus.

166 H. S. WIGGINS, recalled for further examination, testified on behalf of the defendant as follows, pages 445 to 450, printed record:

Direct examination by Mr. Stewart:

In my examination of the books I noticed in one place in one of the journals where there had been some leaves taken out. I think it was Journal D or C. I made a note of it on the margin of the book. I don't exactly recall the date. I can tell by looking at the book.

The bench repairs during the year 1907 amounted to something like $9,000.00 and that is what is charged into the accounts called contingent bench repairs. The reason it is charged into that account instead of bench repairs proper is so that it can be spread over a term of years supposed to represent the life of the repairs made. In 1907 the amount charged out for bench repairs was $4,022.24 which was very largely in excess of the years 1905 and 1906. A great portion of it is still standing in the contingent bench repair account. During 1907 from April on they usually charged about $361.00 a month. That commenced with the time the extensive improvements were made and that improvement then amounted to about $9,000.00. That indicated that it would all be charged out in about twenty-five months. I found no adequate reason for the marked increase in the cost of the manufacture of coal gas, starting from 1904 at 40¢ 1906 54¢ and 1907 62¢ per M. cu. ft. I have not been able to find any reason for the marked increase in the cost of the retort labor something over 3¢ per thousand cubic feet from 1905 to 1907, as shown on Exhibit 117. The retort house labor as I understand it and am informed, consists principally of wages paid to stokers. I found the rate of pay to stokers had not materially increased from 1905 to 1906 and had not at all increased from 1906 to 1907. This is as far as my observations of the pay roll goes.

167 I have not from my examination of the books and records of the company, been able to examine and verify and determine the integrity of the pay roll and identify the parties receiving the pay.

Cross-examination by Mr. Rose:

That was not due to the fault of the company, but to lack of time; nor was it due to any lack of facilities of the company, and I was not asked by Mr. Stewart to do that. I did not go over that ground. To make an audit of the books covered in my work would require months and I only had weeks.

The cost of the retort house labor was higher per thousand cubic feet in 1907 than it was in 1906 and in 1906 it was higher than it was in 1905. It was mentioned at one time that there had been a strike down there and some of the men from the office had gone down and tried to shovel the coal into the retorts. Mr. Honeywell told me recently that they had not been able to get experienced stokers and that they had put in machinery for putting in the fuel and that the men that were in that class of work remained with them right along month after month. In fact, I found the same names running right through for a long period of time. How long the strike lasted I did not inquire. But whatever would be the immediate cause of employing more labor to do this work, would not be exhibited on the face of the books. I suppose it would be regulated by the amount of gas made, that is, the proportion of the increase in labor would be. In order to reconcile this increase and find an efficient excuse we would have to resort to information outside of the general books. If it was actually shown that more was actually spent for the retort house labor, that would be of itself sufficient to

raise the cost of coal gas in the holder. You could not discover the cause merely on the face of the books without resorting to collateral information, such as analysing the pay roll to see how many men were employed, etc. I would hardly admit that the fact that I did not find the explanation on the books, would be wholly un-
168 important. I made an analysis this far, I went through the distribution of expenditure and checked the items month after month, and I would notice at times a very considerable increase in cost.

The books in which the pages are missing are now before me and those pages are pages 194 to 199. The entry on page 194 is the closing entry of the books of the former company. It is in the handwriting apparently of an auditor and is a different handwriting from the handwriting of the bookkeeper who previously kept the books. It closed on November 30, 1901. The first entry following that is on page 201 and the opening remark there is dated December 19, 1901, and is in the handwriting of the same person who made the closing entry. The entry on December 19, 1901, is the transfer entry opening the new book. That transfer is of date December 13th. The different items in those entries give reference to the ledger pages on which the accounts are found. The cash item is supposed to be at page one of the ledger. I could not say whether this was a continuous record or not. I have not checked over to see whether the opening entry is a correct transfer to correspond with the closing entry of the old company. A checking would probably disclose that and whether it is a continuous record. It is a matter of practice with me to make a notation of any missing leaves, in any book of account, and I made this just in the ordinary course. I do not believe I went into it close enough to find whether there was any significance to it. I assumed that the leaves were not taken out of there without reason, but book-keepers often take a leaf out because they make an error. It is bad practice. The bookkeeper can tell you about that better than I can.

169 EDWARD W. BEMIS, being first duly sworn, testified on behalf of the defendant as follows, pages 352 to 420, printed record:

Direct examination by Mr. Stewart:

I reside and have resided in Cleveland, Ohio, for the last seven years and during that time have been superintendent of the waterworks. From 1889 to 1899 I had been teaching in the department of economy and history at Vanderbilt University, Chicago University, and the State Agricultural College of Kansas, and from that time until I went to Cleveland, I was engaged in general statistical work partly for the State of Illinois and partly for the United States government, doing some research work. It was largely in the line of gas and problems kindred to gas itself, street railways, and electric lighting to some extent. I have studied the problem of gas quite a good deal since 1890, when I made some special studies on the subject and published them. Between a waterworks and the gas

business there is a good deal of analogy in the distribution system. The mains are laid very much the same way, only deeper in the soil. They are very much the same kind of mains. The services are somewhat smaller. In Cleveland they use the meters almost universally and have something — 65,000 meters in use. The system is considerably analogous to the metering of gas, and the general distribution system and the collection of bills, the relation of the company to the customers, etc., is something similar to that of gas. I have had special experience in investigating the matter of manufacture and distribution of gas.

I have been employed by a good many cities in cases like this and have appeared before the State Commission of Public Utilities of New York many times, and likewise a good many times before the state gas commission, and legislature, and state and federal courts to some extent, as a witness. I was one of the committee of five of the National Civic Federation that made a special study
170 of private and municipal gas works, waterworks, street railways, here and in Great Britain two years ago, and I was one of the committee that wrote the final report or series of reports. There were several published.

I was connected with the investigation of the gas plant in the District of Columbia, but I made less investigation there than in most places. I went down there recently to appear before the Congressional committee on the subject connected with the gas company and its prices in Washington. I have done more work a good deal in many other cities than I have in Washington. I have done a large amount of work in the city of New York, a good deal in Boston, Syracuse, Buffalo, Saginaw, Cedar Rapids, Ia., and Montreal, and a good many other cities. That work consisted in a study of the amounts of the accounts of the companies and an analysis of their costs and a general attempt to find out the reasonable costs of manufacture and distribution of gas. In these investigations I have familiarized myself to a reasonable degree with the process of the manufacture of gas, and the labor and material entering into it. Of course, I have never been connected with gas works in a practical way but I have been through a great many and I was obliged to know a good deal about the work in order to understand the cost and accounting system, and to a considerable degree I am familiar with the make-up of a gas plant, and I have made a study of the life of the various apparatuses and the constituent parts of the property of a gas plant. I visited the gas plant here for a short time and read most of the testimony and heard some of it, and I have had submitted to me the analysis of the accounts as prepared by Mr. Wiggins, and I have studied and examined the reports of the gas company which they get out annually. The reports show a material difference before and after the adoption of what is called the quality ordinance in March, 1906. I examined the reports for 1905, 1906 and 1907. The books show the average candle power for mixed gas for 1905 and 1906. They do now show the B. T. U. for 1905. Therefore the per-
171 cent that I have had to rely on is the candle power but that, to my mind, is a sufficient total. The B. T. U. varies largely

with the candle power. The books show that the average candle power of the mixed gas in 1905 was 17.015 candle power. In 1906 it was 18.08 candle power. The difference of a candle power will make about 20 heat units.

The best authority for this, I would say, I do not know whether he is any better than some others on this point, but there is a recent handbook for gas engineers by Latta who quotes Prof. B. Lewes, of London on page 161: "A difference of candle power in water gas will make 20 points difference in heat units. Beginning with 15 candle power yielding 547 gross, B. T. U.; 16 candle power, 567 B. T. U.; 17 candle, 587 B. T. U.; 20 candles, 647 B. T. U. With coal gas you have a higher B. T. U. 15 candle, 610 B. T. U.; 16 candle, 625 B. T. U.; 17 candle, 647 B. T. U. But in each case the difference of a candle power makes a difference of about 20 B. T. U. of heat units." That made a difference of 1⅔ candle which is the difference between 17 and 15 and 18.08 candles in the mixed gas, and will make a little over 30 in the heat units, about 33, perhaps. It will be about ⅓ of a gallon of oil or about 1½¢ per thousand cubic feet, at the price they are paying for fuel. I have investigated the life of the various classes of property that enter into the construction of a gas plant.

I have made a large number of inquiries and a study of the history of different parts of plants that were in use and have studied the literature upon the subject. A great deal has been written on that subject in the last five years in the engineering journals and textbooks. One can divide a gas plant for this purpose quite conveniently into five classes or divisions. First, the land, which has no depreciation, second the working capital which consists of supplies on hand that are quickly used up and cash, third, mains, fourth, buildings, and holders, and fifth, the rest of the plant outside of the benches and tools which are renewed year by year out of the repair account. The mains have the longest life. There is
172 practically no limit to the life of the mains so far as engineering knowledge can determine. There are two conditions which affect the life of a main. One is some ususual degree of electrolysis or destruction from the alkali or salt in the soil, and second from the mains becoming inadequate in size from the growth of the business, requiring a very much larger main. Without those two causes present there is no particular reason why a main should not last 500 years. The wear and tear is practically nothing and the same is true of water mains. There is not much difference between the two in that respect. They are made of the same material. The gas mains in a city of this character would be affected by the alkali or salt in the soil if they were largely present. I have heard no testimony indicating that that was the case. On the water main there has been some evidence as to trouble with electrolysis near the power house, and yet I have heard nothing relating to it anywhere else to any degree and I have read the testimony of the company's witnesses on the subject, too. As to mains becoming inadequate, there is some force in that but not through most of the system. It is only in a few sections where mains have to be re-enforced.

Usually they are not taken up but a main is put in on the other side of the street.

For example, in our 700 miles of main in Cleveland which is more than any other gas company in the United States with three or four exceptions, we very rarely take them up and replace them, and the same thing is true with gas mains, there and all over the country. I consider 75 years as the reasonable life for mains though there can be considerable said in favor of 50 years, but that would certainly to be the minimum and in my opinion 75 years would be a reasonable life unless there are extreme local conditions. I class buildings and holders together. They have a life, aside from inadequacy, of over 50 years but on account of inadequacy owing to the development of the business requiring larger holders and different and larger buildings I have usually taken 40 years, but I think
in a growing town in a city no larger than this the displace-
173 ment is more rapid than in a larger and older city and I consider 30 years would be reasonable here. I group the rest of the plant, the meters and services and all of the manufacturing plant, the works and other equipment together. Some of it has a longer life than others but 20 years I consider a fair allowance. In 1907 the company gives the cost of the coal gas in the holder at 62.9¢ and water gas at 39.51¢. In 1906 the company gives the coal gas at 54.26¢ and the water gas at 41.95¢. In 1905 the company gives the coal gas at 40.77¢ and the water gas at 40.95¢. The chief reason for the manufacture of coal gas when water gas can be manufactured so much cheaper that I can see is the lack of adequate holder capacity so that they could rely wholly on their water gas set, but that would apply only in the winter season. During three-fourths of the year I would suppose that they should make a very much larger quantity of water gas relatively than they do now but if they give up their coal gas entirely that would compel them to buy generating fuel for the water gas. Yet they could make considerably less coal gas without doing that if they sold some coke.

Mr. Honeywell said that if they bought their generating fuel they would have to pay from $1.50 to $1.85 a ton more for it than when they obtained it from the coal gas. That would increase the cost of generating the water gas about 4¢ per thousand feet for 1907. At that time the average price of the mixed gas in the holders was 48.08¢, while the water gas was 39.51¢. If no coal gas had been made then 39.51¢ would be increased by this extra payment for coke to about 43.4¢ and there still would be a saving of about 4.6¢ or 4.7¢ per thousand cubic feet. There might have to be a cent's more worth of oil added to keep the B. T. U. up to standard but there still would be, I think, a saving of 4¢. I would not necessarily say that coal gas could be entirely dispensed with in the middle of the winter unless they had more holder capacity, but by making it less than they do now in most years they could, I think, save 3¢ or 4¢. They
have one holder that is 50,000 capacity, and the other is of
174 200,000 capacity. With a combined coal and water gas plant they should have a capacity of about two-thirds of the maximum day's output. One day's output is about 850,000 feet or was

last December, so they ought to have a holder capacity of about five or six hundred thousand feet.

I think an extra 500,000 foot holder would not be too much in addition to what they have got now but even without that I believe they could make less coal gas than they do now and more water gas and therefore cheaper. 12 gallons per ton of coal carbonized is the normal amount of tar residual. I believe 8 gallons is what they get here, and about 1,250 or 1,300 lbs. of coke should be produced per ton of coal carbonized. That is about the normal amount. Also all larger works and even works of this size obtain ammonia residual and some are beginning to save the carbon. The normal amount of leakage or unaccounted-for gas is about 5%. About 150,000 feet per mile of main is the average of companies of this size in Massachusetts. That is about one-half of what they have here. One very common cause of this leakage is high pressure, the mains not being sufficiently re-enforced to take care of the growth of the town. They put on very high pressure at certain hours which has its effect on the leakage of the mains and on the burners on the leakage, and, of course, another occasion is the lack of sufficient attention to the main barring for leaks, etc. Barring is running a bar down to discover where the gas is leaking up. The abnormal leakage when it is due to pressure is remedied by having high pressure mains or large mains going out to supplement the distribution system at the outer rim, and also by paying more attention to repairs and the condition of the mains if it is due to that. There are none of these high pressure mains or supporting mains in this plant. They are quite common in plants at the present time. The leakage in the State of Massachusetts is not different in regard to the low amount than in other cities that I had occasion to study, but it is easier to quote because that
175 is the only state in the country that requires, and has for 20 years, a sworn return and these returns are published each year in the annual reports and these Massachusetts cities and the English companies are the only places you can go for public sworn information on such points. Any other information I would get would come from my observation in connection with the individual cases and plants where I might happen to see the books, and I have investigated this question. Excessive pressure causes blowing of the gas expecially if it is fluctuating. A burner will be adjusted to a pressure of, say 3 inches, and if the pressure goes up at certain hours to five or six inches the burner will blow if it is not turned down. A great many do not bother to go near the burner or they may have to go near it frequently. Pressure fluctuates frequently. That is the indirect result of the mains being too small. The main being small in order to have any pressure at all at certain hours when a good deal of gas is being used, it has to be sent from the works at a very high pressure and then the pressure can be reduced at other hours.

In a properly equipped gas plant the minimum pressure is 1½ in. to the maximum of 4 in. Sometimes it is allowed to run up to 5 in. but that is considered to be rather poor practice. I

have studied the effect on the earnings of an increase of the output of plants of the size similar to this in Lincoln. I have studied the effect in every company in Massachusetts in the last 20 years where I had an opportunity in the files of the gas commission to study it. In the matter of depreciation the first thing to determine is the average life of each particular class of equipment. If the mains were taken at 75 years then 1/75 of their value might be said to disappear each year, yet the mains are nearly as useful right through until near the end of the 75 years, when they will have to be discarded for inadequacy so that the expense of meeting this depreciation that will come in the form of renewing the mains is not felt until the end of the time. We assume ordinary repairs
176 to be met as is usual in all gas companies from year to year, and I am now talking about the ultimate renewals due to the depreciation which cannot be taken care of by ordinary repairs.

The expense of such renewals comes at the end of the life. The problem, therefore, is how to secure the money for renewing the mains at the time they have to be renewed. I cannot conceive of a fairer method than the sinking fund method of determining what sum yearly must be set aside so as to equal the principal or value of the main at an agreed rate of interest in the sinking fund, say four or five per cent, at the end of the life of the main. Suppose some piece of property has a 40 years' life. You may say that 1/40 of the value of it disappears every year. If, however, you ask the gas consumer to pay 1/40 of the value of that piece of property back to the company every year the company has an opportunity to invest that in its plant at more than sinking fund rates or in the savings bank, at the worst, and loan it out at sinking fund rates, and even at 4% interest its full value paid in 40 annual installments would make at the end of that time 2½ times the principal. That is, if you had a building worth $100,000 and you assume that it had a 40 years' life, and therefore loses $2,500 a year, and the gas consumers pay $2,500 a year to the company, the consumers will pay apparently $100,000 by the end of the 40 years. The company will have $250,000 to show for it. It seems to me that if the company gets $100,000 at the time it needs it when the buildings need renewal at the end of the 40 years. It has been recouped for all its loss and $1,000 a year instead of $2,500 a year in a 4% sinking fund will make $100,000 at the end of 40 years. The difference is that the consumers keep the profit of the investment instead of the company. Therefore it seems to me that the sinking fund method is the proper way to finance depreciation. Taking Mr. Malone's valuation the first thing to do in determining the proper amount of depreciation is to divide into classes the properties which have different average lives. This I have done. I have excluded the real estate entirely. This
177 leaves $543,072.72. The mains in dirt streets and in paved streets are given by the company at $220,605. The buildings are given at $37,286, and the holders with the tanks are given at $33,675, making a total of $70,961 for the buildings and holders. The balance of the investment I have grouped together in a class

by itself which covers the manufacturing plant, the meters and services, and everything not included in the mains, buildings, and holders. This balance is $251,506.72.

Now, I applied 75 years of life to the mains, 30 years to the buildings and holders, and 20 years to the rest. The amount necessary to put away annually on a sinking fund basis at 5% to replace the mains in 75 years is only $287.79. 5%, I think, is a proper sinking fund charge in this part of the United States where interest is a little higher. In New York I should take 4%. It is necessary to set aside $1,071.51 a year for 30 years on a sinking fund basis at 5% to replace the buildings, and holders, and it is necessary to set aside $7,595.51 annually for 20 years on a sinking fund basis to replace the balance of the property, a total required for the replacement of the three classes of property, of $8,953.81, which, on the basis of 179,366 ft. of sales in 1907 is about 5¢ per thousand feet. It does not vary .01¢ from that. If the mains be given a 50 years' life instead of a life of 75 years it will add $500.50 a year to the amount necessary to be set aside yearly for the replacement of the mains, or .43¢ per thousand cubic feet of gas sold last year, making a total of 5.43¢ per thousand feet. This is on the company's showing or claim of value. In computing this depreciation I gave the company the benefit of the value of paving over the mains which was included in the company's valuation. I did not include their allowance of about 10% for engineering and interest. Neither have I included the cost of obtaining the money. Allowing them depreciation on the 10% for engineering and contingent expense would bring the whole depreciation up to about 6¢ per thou-

sand cubic feet. On Mr. Deffenbaugh's valuation of the
178 mains at $243,000.00 aside from paving with a life of 75
years, it would require $185.90 to replace them. For $20,000 for the value of the buildings after allowing for depreciation and allowing $15,300 for the holders and tanks which is $60 per thousand cubic feet of capacity, which is high considering their age and condition, makes a total of $35,300, which, with a 30 year life, would require 1.51% to be set aside annually for depreciation. Allowing for the balance of the property at $211,893, and excluding the paving and land, would require $6,399.17 to be set aside annually to replace it. This makes the total depreciation on that basis, of $7,118.10 yearly, or 3.97¢, or practically 4¢, per thousand cubic feet on the output for 1907. Allowing 50 years as the life of the mains in this computation and everything else remaining the same, it would add .28¢ per thousand cubic feet and make the total depreciation 4.25¢ per thousand cubic feet of sales in 1907.

One of the holders, capacity 205,000 feet, is about 18 years old, and it is valued at $168.53 per thousand feet capacity, and the other, capacity 50,000 feet, is over 20 years old, and that has been valued at $187.50 per thousand feet capacity including the tank. Now these holders have depreciated more than one-half. That is, more than one-half the 30 years I have allowed them has expired. Two-thirds of their life and fully half their value has gone, and I have allowed them $60 a thousand feet of capacity, which I con-

sider a liberal allowance. The value of the holders and the cost of construction run, according to size, from $60 to $75 a thousand feet for a five million foot holder, up to $200 per thousand feet for the 50,000 foot holders. It varies somewhat with the part of the country and with the prevailing prices for iron but a 500,000 foot holder could generally be erected for $125 per thousand feet capacity, and a 200,000 foot holder, for about $150. In the past we have erected them for less than that when iron was cheaper. With regard to the mains, the estimate of Mr. Deffenbaugh of $243,000 which I used, appears to be higher than what it
179 cost the company. The last three annual reports, for 1905, 1906, and 1907, show first in regard to their 2-inch mains that in 1905 they cost them 23.6¢ a foot, including labor and material. In 1905 this cost was 19.3¢ a foot, and in 1907, 21.2¢ a foot, and I took the 21.2¢ and applied it to the entire length of 2-inch pipe. With regard to the 4-inch pipe, in 1905 the cost was 27.8¢ per foot for labor and material; in 1906 it was 51.2¢. I took 51.2¢ as the basis. With regard to the 6-inch pipe, the only pipe they laid was in 1906, when it cost them 68.2¢, and I have used that figure for all of their 6-inch pipe. With regard to the 8-inch pipe, the only pipe they have laid in the last three years was in 1905, when it cost them 88.3¢, and I have used that for the entire main. The price of iron pipe this year is lower than it has been for several years all over the country. I have no figures for the 10-inch, 12-inch, 16-inch, and 20-inch pipe, but there is very little of it.

The price for the 2-inch, 4-inch, 6-inch, and 8-inch is remarkably close, almost within 10% of the figures given by the company under oath in a case a few weeks ago so I have taken for the larger size the Cedar Rapids figures, that the company itself gave. This was, for the 10-inch pipe, $1.13½ a foot; I have taken here $1.20. For the 12-inch the Cedar Rapids price was $1.45; I have taken it here at $1.50. For the 16-inch the Cedar Rapids price was $2.07; I have taken it here, $2.15. For the 20-inch they did not have any at Cedar Rapids, but I have taken $3 as a rather high approximation. Applying these results to the entire system the total is $127,269.80 as compared to Mr. Deffenbaugh's valuation of $143,000. I have had experience in the matter of laying mains and know the cost, but I have not placed definite figures on water mains to the situation here because they are laid so much deeper. We lay our mains 6 ft. from the top of the ground and the services the same depth to protect them from frost. These are deeper than most water companies lay and I have thought it much more correct to take the company's own figures for gas pipe. As to the
180 services, in 1907 they report a net cost of $8.55 after deducting some receipts from consumers for part of the service. An average for all laid in 1906 they gave in their report, $8.27 and in 1905 it is $12.06. They did not receive so much from consumers that year. Some years they receive — some consumers a larger amount than in other years.

As to the efficiency of the company's plant here, they appear to

have a coal gas plant and I have learned since my testimony yesterday that they are putting up a 7 ft. 6 in. water gas set which will so largely increase their capacity that it will render possibly unnecessary the extra holder I spoke of and will allow a larger amount of water gas compared with coal gas. With respect to the mains the system is in very poor shape as illustrated by this fact: out of 338,594 feet of main, 220,705 ft. is 2-inch, which is 65.2% of the total. I don't think I have ever come across a company that has so large an amount of 2-inch main, in percent. I have gone through the entire 60 companies in Massachusetts on that point as given in their last annual report and I do not think there is one that has as high as 50% of 2-inch mains. The whole tendency of the gas business is to discard their 2-inch mains. They are written off in many places as having very little value on account of the size. They have become inadequate to a considerable degree and it requires such a high pressure to force the gas through them, and keep up the pressure in a city, especially at certain hours of the day. This high pressure increases the leakage, and also the dissatisfaction among consumers on account of the unequal and high pressure causing blowing, which increases the gas bills without a corresponding increase of light and heat. When the pressure is high and the burners are not turned down and adjusted to it, the gas will go through without giving its full illuminating or heating value. It will register in the meter just the same but does not give the benefit to the consumer. Such a high pressure may be almost a necessity, however.

181 When I was speaking of the life of 75 years on mains I assumed mains of the ordinary size. I think this 2-inch pipe has practically lost four-fifths of the value already on account of inadequacy. It is with reference to the 4-inch, 6-inch, 8-inch, and upward sizes that the longer life is predicated on. These smaller mains have been discarded long ago by most companies and they are not being put in very much now at all except in alleys in a few neighborhoods that do not use much gas. With respect to the efficiency of operation and management of the company as shown by the reports here, I have observed in the coal gas plant some increase of cost which I cannot explain. In the last two years, for example, the retort house labor has increased from $5.25 per thousand feet in 1905 to $8.18 per thousand feet in 1907, or nearly 60%. The wages of the stokers in 1905 were $2 and $2.25 a day and today they are all $2.25. They have not increased over 10%. Mr. Wiggins told me about the wages.

The failure to save all of the tar, being a yield of only 8 gallons instead of 12 gallons to a ton of coal, and the failure to save ammonia is evidence of lack of facilities at the plant or something else, which would be remedied, I think, in most companies. Even if the tar is of little value for heating purposes it is better to save it for that than to let it run to waste. There are some other items in the matter of charges that do not relate that I know of to management. The normal leakage is from five to six per cent, and the leakage of this company last year was 11.84%. It was as low as 6.84 in 1903, and

has been rising until it reached, in 1906, 16.56, then it fell to 11.84 in 1907. 3¢ a thousand feet is usually considered the proper expenditure for promotion of new business. It has been much more here but it has doubtless produced good results in developing new business. Last year it was 7.47 but I would not expect that in the future it would exceed 3¢. A reduction in price of gas would render unnecessary the expenditure of so large a sum for extension
182 of the business. That is to be taken strongly into account. The reduction in price, itself, will advertise the business and induce a considerable increase of sales of the gas as a substitute for coal.

The working capital is given here at $59,146.88. By the testimony of Mr. Wiggins it was shown that the company was owing about $50,000 in accounts payable, I assume for supplies and materials, which is a credit enjoyed by the company and to that extent is a balance or set-off of the working capital to the extent to which the company gets capital free of charge from those from whom it buys supplies, and to that extent it should be set off from the supplies on hand, and the working capital. I don't know whether or not this $50,000 accounts payable applies to the plant as a whole but if it does, two-thirds of it would apply to the gas department, or about $33,000.

I have also noted that the amount of the coke stock on hand at the end of 1907 was much higher than it was in June, 1906, or June, 1905. Starting with the amount the company gives as its operation cost, starting with the receipts of the company in 1907 from the gas when the price was $1.20, the books show that the net receipts were $1.2031 after deducting losses from bad debts, adding the amount received from those who had paid the minimum charge but did not use the full amount of gas, and after adding the forfeited discounts, if the price were reduced to $1, the price including the forfeited discounts, etc., and deducting the losses on the bad debts, it would be at the same result of $1.31 and taking off 2.5 cents which I understand is a new tax that has been lately imposed it would be reduced to 97.81¢. The company claims operating costs in 1907 as 79.12 and there would be a margin of 18.69¢. To this should be added the saving from first, promotion, 4.5¢, second, a reduction of unaccounted-for gas by 40¢, still leaving about 7¢ which is higher than I have considered reasonable. That would be a reduction of 2¢. Third, I notice that the legal expenses in 1907 were 1.2¢ per thousand feet sold, or a half-cent higher than the average of the previous four years, which were, in 1903, .74¢; in 1904, .71¢; in
183 1905, .45¢; in 1906, .49¢. I believe I added in 1902 which was 1.01¢ and found the average of all five years was about ½¢ lower than the 1.2¢ in 1907. I assumed that the normal expense would be indicated by the average of those five years and considered a probable saving in the future of ½¢, which would mean a total deduction from promotion, leakage, and legal expenses of 7¢.

There are questions of the residuals which I have looked into a little but unfortunately it was not possible for the company to give me the data until late last evening and I have not had *had* the full

time I had hoped for, but I did discover on hasty examination the following on that. In 1907 the company sold 21,175 gallons of tar for $1,404.44 or at the rate of 6.13¢ a gallon. They used in the various parts of the work 93,353 gallons which they credit at only $1,900.99, or 2.03¢ per gallon. The entire expense of handling the tar whether sold or used was $617.89, or .54¢ a gallon for all the tar used or sold, or about 2½¢ a gallon if that is concentrated on the tar sold. If it is concentrated on the tar sold then they netted from that 4.19¢ per gallon. The net sales of tar were $886.55, and the value of the tar used at the works was 2¢ a gallon or $1,909.99, which makes $2,787.54 credit for the value of residuals. They have credited for the value of residuals from the tar, only $1,248.26. In other words, the company appears to have received from the tar sold less the expense of handling plus the tar used for making steam in the electric department, even at only 2¢ a gallon, $1,539.28 more than the coal gas department or the gas department in general was credited with receiving, which is about 1¢ per thousand feet of all the gas made. It cannot be accounted for by any large difference between the tar used and sold and the tar made for there is not any large difference. The tar made during the year was 108,263 gallons, and the tar used or sold was 114,728 gallons, a very slight difference or only 6%, which cannot account for this discrepancy. In other words, by charging the whole thing to stock as they do in making such an arbitrary charge for residuals they make the cost of
184 gas last year about ¾¢ higher than it should be as I read the books, based on the tar account. With regard to the coke residuals, I find that in 1907 they obtained for the coke sold, and the breeze, $6,492.70. All of the expense taking care of the coke whether sold or kept at the works is $2,902.13, leaving the net profit on the coke sold and concentrating all the expense on that, which, of course, ought not to be done, $3,590.64. The value of the coke used by the company in its water gas and electric departments and elsewhere is given at $18,755.02 or a total profit from the coke of $22,345.66, but the company credits itself on the coke residuals at only $20,537.73. The difference is $1,807.93, or about 1¢ per thousand feet of gas sold, so there is 1¾¢. This appears to be borne out by the records and books on such a hasty examination as I was able to make after getting the report. If I add that in it makes 8.75¢ per thousand feet of possible profit.

I have omitted from this summary the item of the retort house labor. That increased in 1907 nearly 3¢ per thousand feet of coal gas made over 1905, which would be an increase of about 1½¢ if distributed over both coal and water gas. If we take as a basis the reasonableness of the 1905 figures plus 10% increase in the stokers's wages, it would make the margin of profit 28.69¢ with gas at $1. From this must be deducted an allowance for depreciation which as I estimated this morning was 4¢ according to my estimate of value on a 75 year life on mains, to 6¢ with the company's allowance for valuation and 50 year life of mains, so that it would leave a margin of profit from 24.69 to 22.69 per thousand cubic feet after allowing for depreciation. The total interest and dividends paid out by the 11

Massachusetts companies having over 75,000,000 of sales, exclusive of Boston, was 23¢ per M feet last year. This plant has a much lower capital structural value than many plants because of the greater amount of 2-inch pipe, the very small amount of holder capacity, and the age, and large proportion of water gas plant, which is much cheaper to install than coal gas. From all of these causes
184½ the plant here has a lower structural value per thousand feet than many eastern companies. A structural value of one-half million dollars would be only $2.50 per thousand feet of sales and even $600,000 would only be about $3 per thousand feet of sales, assuming the sales to be next year 200,000,000 at rough figures. 7% of $3 is only 21¢, and 7% of $2.50 is only 17½¢ per thousand feet, and margin of profit would be correspondingly lower than at the rate of 6% or 5%. I use 7% on the theory that rates are a little higher here than in Iowa or in the east where I have always used 6%. $8,000 a year is approximately the figure that I have allowed for depreciation. $7,000 is the figure on my estimate and it would be about $10,000 on the company's valuation.

Reconstruction reserve is considered as synonymous with depreciation. It is maintained to meet the same thing. The contingency of increasing the reconstruction reserve on account of earth-quakes, and cyclones can hardly be considered within the bounds of reasonable calculation as they are so extraordinary. The contingency of the discovery of natural gas if it exists at all is exceedingly remote. According to the edition of Brown's Directory, a sort of official compilation of all gas companies in the United States, there is not a single natural gas company in Nebraska. According to the construction account, more than half of the plant was put in prior to 1893, and the average life of the entire plant must be fully 20 years. Now if we assume the depreciation of the company's business at 5% a year straight depreciation, without a sinking fund basis, then it would have practically no value at all today. But on a 20 year life with my theory of a sinking fund the plant would be worth a little over one-half or about one-half of its original cost. I did not include in my computation of valuations, piping for gas ranges on the theory that that was part of past promotion and gratuitous service and not the property of the gas company today. The pavement I excluded on the ground that the company had not paid anything for it. However, neither of these items were excluded on
184¾ the estimate made on the basis of the company's valuation.

Cross-examination by Mr. Rose:

The handbook I referred to is published by a man named Latta in New York City. I do not remember his initials. I do not know how old a man he is. I do not know what experience he has had as a construction engineer and manager of gas works. The quotation I gave from him was from a very prominent chemist. I do not know a thing about him or his earnings. I have not intended and have not quoted him as an authority. I intended to give it as a quotation from Prof. Lewes and I assumed that Latta's quotation was correct. I do not know that there is an absolutely fixed relation be-

tween the candle power and the heating power. I listened to some testimony by a professor at the University of Michigan in the Saginaw gas recently on the history of some tests made at a particular plant and I took some notes but I do not have them with me. I inquired for what tests the city had here but they have not been handed to me. I think they were over-looked. There is an approximate relation between the candle power and the heat unit of gas but it is not absolute. I do not understand that there is not even an approximate relation, that the variations are so great that we must admit that there is no practical application between the two. This is true if you confine it to coal gas or water gas but, of course, the ratio is different in the two gases and the proportion of the mixture would make a different relation. My principal investigations on the subject of gas has been in the line of acquiring statistics. As a statistician I prefer to go back as far as possible and I asked for the results here of four or five years and I have had access to such as Mr. Wiggins was able to prepare. My suggested economizing of costs here was based on the year 1907. 1904 was as favorable a year for water gas and much more favorable for coal gas. In my testimony I gave the items for the years 1907, 1906, and 1905, and then I suggested that for the future a saving could be made by generating more water gas, basing my figures on the year 1907.

185 Between 1905 and 1907 there was only a difference of 1.4¢ in water gas. The last year has more weight. In my computation of what might be saved by the company manufacturing water gas I took as the base rate for water gas, 39.51, station costs, and for coal gas, 62.9¢, which are the figures of 1907, and had I applied the same test of the experience of the company in 1905, I would have found on the same identical analysis that the cost of the water gas exclusively would have been greater than the cost of the mixed gas. It would have increased the cost of the mixed gas that year of 40.77¢ for coal gas and 40.95¢ for water gas if I had used the water gas exclusively, and I would not have had the benefit of economy and residuals from coke, but if I had used 1905 exclusively for coal and water gas, I would have started on 33.07¢ instead of 79.12¢.

In 1905 the total cost was nearly 6% less than 1907, for the mixed gas, so I was taking the last year which was more favorable to the company than if I had taken 1905. I think there was a reason in 9105 for its being so low and a reason why, therefore, it wouldn't have been fair to take it. The same loss of economy in fuel and residual that I analyzed and exhibited in 1907 if applied to 1905 would have made the result of the manufacture of all water gas show an increased cost over what the actual experience was from the use of coal and water gas, but it would still have been less than in 1907. Assuming the prices of fuel, coal, and oil to be what the company had paid in actual experience and later paid for 1907 under those same conditions the manufacture of exclusive water gas would have been increased about 4½¢ if it had not been for the manufacture of coal gas which was mixed with it. This is because of the increased price of coke of $1.85 which amounts to

about three and a fraction cents a thousand feet, oil about a cent per thousand feet, making a total of about 4½¢. It was around 4¢. That same economy derived from the manufacture of coal gas alone as applied to the net comparative cost at the station of coal and water gas in 1905 if eliminated, would have made the water gas that year cost much more than the combined cost of the
186 mixed gas but I had a reason for rejecting 1905 that I thought was fair to the company. Whether the actual experience showed the station cost to be high or low the same elements would affect the cost of the water gas at the station in order to bring the efficiency of the gas up to the standard required.

Coal gas in 1905 was a different proposition to 1907, and this cannot be ignored in any comparison. The whole question was the coal—the coal used in 1905. I understood that poor coal that had some sulphur in it was used in 1905, and they couldn't continue using it. Now if that was wrong then it would have been, perhaps, fairer to use 1905. Coal gas rose from a cost of 40.77¢ in 1905 to 54.26¢ in 1906, and to 62.9¢ in 1907. I know that it would not be fair to take any one year and form a conclusion from that year. Prices of oil and coal will fluctuate and that is why I tried to use all of these years but I did not use them in giving my probable results in the line of economy for manufacturing a greater proportion of water gas because I thought that water gas had to be compared with coal gas under existing conditions of coal. At the same time conditions of one year may be reversed the next. I was not arguing that the coal gas plant should be scrapped but it ought not to be used during the present prices. It would be a good thing to keep both plants ready for use and I would not criticise the company for keeping both in this locality. A 500,000 foot holder installed and erected here in Lincoln would cost in the neighborhood of $50,000. That would not include the land.

I arrived here to attend this trial Wednesday morning, and I have attended the hearings persistently. To a slight degree I have assisted the city attorney and made suggestions. I had read much of the testimony previously taken before I came. Aside from reading the testimony in this case and the various exhibits which I had at home I had only been in Lincoln once before and that was only a little pleasure trip. I do not remember any business. I was here four or five hours perhaps. I drove a little bit around town, but I did not see much of it.
187 That was eight or nine years ago. I haven't looked up the population of Lincoln at all in the past years. Knowing nothing about the population and conditions in 1872 it would be very hard to say what would be the reasonable requirements and future needs of the public in a plant of this kind. An engineer could not very well tell what the future development of the town might be. In 1890 when it was reconstructed an engineer could not go into the field of prophecy and ascertain the particular size of the equipment for the future needs of the city. He could do it better than in 1873 on account of the past history of the town.

Having had the experience of the town in the past it would be more of a guide. I am not acquainted with the state of development of this city now as compared with what it was in 1890, and I haven't looked up the relative values of property. Those things would be important in judging the prudence of the engineer in building this property. An engineer would want that data. I would not want to judge the intellectual capacity of the engineer who laid the plant out at that time without knowing these facts. Hind-sight is better than foresight. I do not recognize or question the rights in any investment where they put their money into any sort of business. It may develop or it may go down. I don't know that there is an absolute right in the matter. They saw a going town and they put their money in. If in 1870 Lincoln was a city of 1,000 inhabitants and the entire consumption of gas demanded then was about 65,000 a year I would not think under those circumstances an engineering project that provided for a plant for the needs of a city of 50,000 people in the future would be justified. A much larger allowance must be made for depreciation in a town of 5,000 or 1,000 growing up to a town of 40,000 than afterwards. Inadequacy develops more rapidly. I took an average of Brockton, Charleston, East Boston, Haverhill, Malden, New Bedford, Newton, and Salem for leakage. Those were the towns that had over 100,000,000 feet of sales and under 300,000,000 feet in the year ending June 30, 1907. The towns that had dividends and interest of 23¢ were every 188 town having sales over 75,000,000, except Boston.

In Brockton they have 87½ miles of main and sales of 129,732,800 feet. In Charleston, they have 55½ miles of main and the sales are 210,163,264 feet; in East Boston they have 29 4/5 miles of main and the sales are 159,975,000 feet; in Haverhill, 54¾ miles of main and sales of 182,359,100 feet; in Malden they have 149½ miles of main and sales of 218,222,870 feet. Malden has a leakage of 12.07¢ which is the highest of all. New Bedford has 81 4/5 miles of main and 229,652,295 feet of sales; Newton has 126 miles of main and 188,242,500 feet of sales. The leakage in Newton is 4.31. Salem has 55¾ miles of main with 118,327,800 feet of sales. All of the gas plants in Massachusetts dated with Boston somewhere about 1820, and the others followed along. The majority of them, I do not think came until after 1840. Just how soon after that they came, I could not say. I don't know as I ever saw the figures. The plants in these towns were probably all installed between 1840 and 1860. It might have been a little later in one or two. A good many of these towns such as Salem and New Bedford were formed under the authority of the British government before the independence.

Haverhill and Brockton are manufacturing towns and probably have been prominent about 30 or 40 years. I do not know what the ratio of the increase of population has been in the last 35 years in these towns. Many of these towns have the traditionally New England elms with the wide lawns between the curbs and the house. Newton is pre-eminently of that character and Charleston is a little of that character. I think some of these towns have as great a width

from house line to house line or even from curb to curb as they have here. I have driven in both Newton and Lincoln and I would say that Newton has as wide streets as Lincoln. I have been in many others but not recently and I do not recall about them. It is very hard to say how many of these towns are laid out checker-board fashion, the regular platted streets intersecting giving 300 feet blocks in the clear with an alley intervening out of that, and all of
189 them have streets that average in excess of 100 feet. I could not say whether or — any of them are platted that way. There perhaps is not a town in Massachusetts where that condition exists in just that form. There may not be any town among those which have been mentioned that has such a great proportionate area within its corporate limits in public highways or streets as in Lincoln. I do not know positively.

The first 15 or 20 years of the life of a plant is of very great importance in determining what the reasonable rate of depreciation is. I should say after 20 years in a town the company would have a pretty reliable experience to go on. I do not know anything about the conditions in Wichita, Kans. I would not undertake to say whether or not a company can anticipate the future requirements as late as 1890 of Wichita. I do not know within what period the demand from southeast Lincoln has been added to the plant here. I do not know when the demand in north Lincoln in Belmont or Yulanda place was taken off of this plant, nor do I know about that section of the town being moved away bodily. Nor do I know anything about the history of the southeast part of Lincoln. These conditions would affect the past depreciation. They would also affect the present structural value of the property if there are a lot of mains in abandoned streets. If a main that might have been reasonably adequate as far as an engineer could have seen in 1890 became wholly inadequate by reason of the extension of the town in those directions that would affect the depreciation. In considering the future it is necessary for the engineer to know local conditions and the past. Of course, we always have the experience of the company.

In deciding the present value of the property any mistakes that were not intentional but any failure to adjust the plant to the needs of the city and its growth will affect the amount that you will have to write off today in getting the present structural value, and that has caused in the past the writing off of more depreciation
190 than if such failure to anticipate the future had not existed. There is need here of increased capital for larger mains or high pressure mains, and so far as increased mains are necessary to reduce the leakage it will be necessary to make an allowance for interest and income upon the additional investment, and so far as the increased facilities at the station what are now being installed, that means there will be additional invested capital to be compensated for, and, testifying eight or nine months after Mr. Malone testified, one ought to add in the investment made since that time, in applying the present conditions. I took into account the fact

that the city of Lincoln is in part located in the salt basin and that the plant itself is located on the Salt Creek bottoms.

I asked Mr. Deffenbaugh if alkali had hurt the water mains because I saw something in the testimony of Mr. Malone or somebody in regard to that. I took Mr. Deffenbaugh's statement that he had not observed any bad effects from the soil. I heard the testimony of Mr. Deffenbaugh on that point here. I had not heard that the F street well located within the city had produced salt water so briny that they had to abandon the well, and that it affected the pumps and private services in use in the *the* water department of the city of Lincoln, and I had not been informed that there is a flowing salt well in Government square right in the heart of the city, and I was not advised that around the city and extending perhaps into the corporate limits there are areas of alkali salt, and that there are areas of alkali salt within the city where the gas mains have to be laid, and I have never been out to see what are called the salt basins here, and I did not know that salt had accumulated on the top of the ground and has been saved right here in the city and carried away in sacks. I am not posted on the historical facts. In Massachusetts they do not make any general rule for the allowance of depreciation but the state authorities take it up in each company separately as they come up for hearing. I think they are more rigid now than they were formerly. They had a law allowing 5% on the total cost of the new plant in
191 municipal works, but that was not applied by the commissioners to private companies that I know of. That law was in effect up until about two years ago. I don't think it was reasonable under the conditions of the plants as they existed at that time, and I don't think it was so regarded by the public, and generally accredited over the country as reasonable, and I do not think the practical operating gas engineers in the country considered it reasonable. Practical gas engineers have not made any estimates, to my knowledge, at all. They may have in concrete cases.

The first corporation case that I heard argued or read the history of was the Holyoke case. That came out in 20 volumes in 1898, and in that case President Humphreys of Stevens Institute estimated a depreciation of about 5% or 6% per thousand feet in that plant. The plant has sold 68,000,000 feet of gas about two-thirds coal gas and one-third water gas. He has since said that he did not intend to make that the general rule but only in regard to that plant, and his testimony was of a general character in that case. Holyoke had a population at that time of about 40,000. I think I heard one or two witnesses in this case claim 5% for depreciation and I believe in the Saginaw and Cedar Rapids cases I heard the same but in most of the testimony and evidence that I have seen they have not claimed so high a per cent for depreciation. They have mostly in larger cities, though, such as Buffalo, and Syracuse. The size of the city affects the question of depreciation only as regards inadequacy. A large city is not supposed to grow quite as fast though at times it does. Depreciation is affected by the rapidity of growth which controls the question of inadequacy. The character of the soil and elec-

trolysis affects the durability. With respect to the manufacturing plant the factors there which affect depreciation are the progress of the art and an inadequacy due to the growth of the city, by the wear and tear, but this would be about the same as in the small
192 plant and in a large plant. In testifying on the item of depreciation here I understood that the plant was only organized 35 years ago and was originally constructed with wooden mains that had to be replaced, and the original construction I do not suppose would be as expensive as iron though I do not know. Then the plant had to be practically reconstructed a second time in 1890 or 1892, but I do not understand that there has been any reconstruction of the distribution system except in the matter of those wooden mains.

I have taken into account the testimony here of Mr. Honeywell that the distribution system itself was practically reconstructed in 1890, and then again a large part had to be replaced and reconstructed in 1900 to 1902. I do not believe that the cast iron mains have been renewed to any extent. The renewals were probably wooden mains and 2-inch mains, but I do not think the 4-inch, 6-inch, and 8-inch mains have been replaced except as taken care of in ordinary repairs, by the 6¢ a thousand feet. I have not been informed that the M street 6-inch mains were replaced with 8-inch mains and I did not know that the 27th 4-inch mains were replaced with 6-inch mains, but I am not surprised that the mains from the plant were increased from 8-inch to 20-inch mains. I knew that they must have been increased from the days of old. I have noticed a very great increase in the demand in looking over these reports. That was, of course, contemporaneous with a large additional charge for a new-business department, and indicated on its face that there had been a house to house canvass to put in equipments. While the charges were large for that the expenditure will operate in the end to the economy of distribution, and I would not criticise the expenditure of a large sum of money for new business if there were many tenements that were not equipped previously for gas. Persistent and attractive solicitation is a very useful method to promote the business. Of course, reduction in price will also do it but this other method is a useful one in a measure and ought to be resorted
193 to in connection with a reduction in price. It is desirable and customary to call the attention of individuals to the reduction and to explain the advantages and the equipments. Persons who have not been accustomed to the use of gas need to be informed about it and appliances have to be explained to show the convenience and cost and this requires money. It is a sort of legitimate public exhileration.

When the company is charging rates that are only adequate to maintain its plant and give the constitutional recompense to the stockholders, if there is a decrease in the price there is no known way to make up that decrease except to expand the volume of the business so that by enlarging it they can actually carry it on at a decreased percentage of profit provided they had exercised all reasonable prudence and economy in the management. As a result of

the increased consumption the relative cost per thousand feet of administration and labor and the like will be diminished. As the plant is enlarged there are certain elements of necessary cost of manufacture and distribution that will be decreased relatively per thousand feet of output. In this plant without any other change in the plant itself except a reduction of 20¢ a thousand feet in the sale of gas it would very likely take an increase of 40% in the sales to make up for it. I cannot be positive. 30% might do it. You cannot tell off-hand. I do not think it would require 100%.

At the time this ordinance took effect at the end of 1906 the manufacture and distribution cost of the gas was 82.68¢. The increase of sales in 1907 over 1906 was about 17%. I have not worked out to see and it will be hard to say what decrease in the cost per thousand feet this increase of 17% in the sales means. There was quite an increase of some items that was not due at all to increase of growth. The combined cost of manufacture and distribution for 1907 was 72.12¢, which is a decrease of 3.56% in the cost over the previous year. I have not worked this over in that way. I have observed that a decline of 20¢ in price generally means a decline in profit of not over 15¢ owing to the large increase in business
194 and in the second year it would be a decline of not over 10¢, usually. That generally follows. It will vary in different plants. It is not a precise mathematical rule. It would depend on the energy of the company in following it up. All I mean to say is there is a considerable reduction in cost per thousand feet with a large increase of output sure to follow, but I would not attempt to say that that can be reduced to a definitely ascertained basis in this city.

As to leakage, I stated that on the experience of eight companies in Massachusetts in 1907 it was 6.04%, or 150,000 feet. In 1906 it was 5.92% for unaccounted-for gas. It is generally considered fairer to apply the leakage per mile of main rather than per thousand feet of gas. There were 64 miles of mains here at the close of 1906. At the beginning of 1907 there were about 61 miles, an average of 62½ miles and the sales were nearly 180 million feet. That is not quite 3 million feet per mile of main. I do not know how this compares with Madison, Wis., Denver, Colo., Des Moines, Ia., Omaha, Nebr., or Sioux City, Ia. The leakage is somewhat larger proportionally with a small main and in this plant here there is an abnormal ratio of small mains. In the annual report of leakage the figures are given on both bases. The leakage last year was 385,213 feet per mile of main, and 354,081 feet per mile of mains reduced to a 3-inch size. That is a little over twice what I said these 11 companies had. They have an average of 151,000 and I allowed about 200,000 feet as normal in my calculations. I took off only 40%. They have a more expensive equipment in the Massachusetts companies than they have here and if we bring this company to the basis of the Massachusetts companies we would have to employ a greater amount of capital upon which a dividend would be required. This would partially compensate for the decrease in the leakage.

It is more economical to take care of inadequacy by putting down

a parallel small pipe instead of replacing the old pipe with one that is adequate and save the old one, because it generally saves
195 tearing up the paving for services and mains. They generally put the new pipe near the curb and cut off the services from that side of the street from the old mains and supply them from the new. You would not have to open up the surface much, you could simply open up by the curb whereas if you took up the old main and put a new main in its place you would have to tear up the pavement, and if you laid right close to the curb the services on that side would not be under much paving. Anyway it saves the bother of taking up the main more than anything else and leaves it there and you get its use. There is not any difference in cost. A trench has to be dug anyhow. There is not any very large difference in cost but you save your mains. The leakage undoubtedly slightly increases relative as the size of the main decreases. The chief difference is that you must keep a high pressure on a small main; if you have too many small mains relatively to large ones, you have too high a pressure and it causes the leakage. You have relatively more volume of gas to the area of the crevices or joint, though the pressure accounts for more, but both are elements. By this method of taking care of inadequacy you would have two ditches in the same street. That is the way it is commonly done. It leaves a large portion of the street free from services and rather relieves the congestion of pipe in the street. It relieves the company from having services crossing the street so much. You lay another main near the other curb and then all of the services in the center can be removed as needed. If you want to lay a big water main or a big sewer you can cut it.

I am not aware of, and have not been posted, myself, of the ordinance regulations in Lincoln, governing the laying of mains. It is generally true that they have to be laid under the direction of the city engineer. I don't know what the ordinances are here. Sometimes the franchise provides for that. In Cleveland a good share of the gas mains are laid near the curb, one on each side of the street. They have a hundred miles laid that way. The practicability
196 of doing this would depend somewhat on the regulations of the city. It is not a matter that the company should control arbitrarily because in that respect they are using the public streets and are subject to be directed by the city authorities. I do not mean to say that they should not take up the small mains, but I say that it is a very common method to parallel them. If we were to put down a large main in the one trench it would enable the company to remove the smaller main, and only one trench would be required. I do not think there would be any greater economy then in the matter of leakage in using a larger main because the little economy resulting would be set-off by the longer services. If the smaller mains were removed and the pipes were in a good state of preservation they could be used in some other place where their size would be adequate, and there really would not be much difference in actual economy whether you make the large pipe do the work or whether you reenforced the supply by separate pipe in that section. The engineer in each locality should be the best judge. I say that the paralleling

of the mains is a very common method but the judgment of the local engineer on local conditions would be better.

The figures I have given here on the item of depreciation were theories based on statistics which I have collected. It is an acknowledged truth and it is the practice of constructing engineers to allow for contingencies which are added to the theoretical or estimated cost of practically every improvement that is constructed. It is commonly put in as overhead charges. It is customary to allow ten to fifteen per cent on account of over-head charges, including interest during construction. I want to modify what I said about the cost of construction because I do not think the over-head charges are as great for mains, meters, and services, as for the manufacturing plant. As to the life of the plant I think my figures of life, especially 30 years for the buildings and holders and 20 years for the rest of the plant are lower than any I have ever known given by an engineer for a case, in any case that I ever was connected with, with the
197 possible excep'ion of the Saginaw and Cedar Rapids cases. It is customary to estimate mains from 100 to 75 years, buildings 40 years, holders, 30 to 40 years, and the rest of the plant about 25 years, though some of it will be given a shorter life, but I mean taking it as a group. I have taken a shorter life than is usually done for holders, and in most of the plant here because it was a growing town and not quite so large as some.

I have met Henry L. Doherty, president of this company, and talked with him once or twice and I have heard of him outside. He is prominent in the gas enterprises of this country and is regarded as skilled in bringing properties up to efficiency, and I suppose he is an especially skilled man at promoting consumption for individual plants. I think he is a good engineer in all of those lines. Mr. McMillan is prominent and they are connected with the same enterprises. I think Mr. Doherty is Mr. McMillan's general manager, and Mr. Doherty, I think, is largely interested in both engineering and financing properties of this kind. I have never heard him testify in cases of this character nor have I, as I remember, ever read any of his testimony. I do not think he is given to setting himself up as a witness and I do not know how much he estimates the depreciation of machinery nor how he estimates the depreciation in the whole plant per year. I would consider Mr. McMillan a better authority on industrial operation of gas plants. He has been gathering complete data from these companies for many years. I do know what his company set aside for depreciation a few years ago. It was 5¢ a thousand feet and three or four cents for repairs, an average of 2.8¢ being all that he set aside. He did that in the returns to the U. S. Commissioner of Labor, and it was published by the government at Washington. He gave an itemized statement of his ten or fifteen plants, grouped them together. They had aggregate sales of 3,000,000,000 feet, I think. It appeared in the report of the U. S. Department of Labor for 1899. They were not given as his companies but they were his. It appeared as a group owned by a syndicate,
198 but it appeared later that they were his. I talked with him about it and he wondered how it got out that they were his

companies. I don't know whether his experience in Madison, Denver, Lincoln, St. Joseph, Detroit, Milwaukee, and St. Paul, since that time has demonstrated that the amount he then estimated on the basis of the business he had previously conducted, was wholly inadequate. A year ago he told me that on account of the rise in price of labor and material his figures of that date should be raised somewhat, but it was 8¢ then for the aggregate of repairs and depreciation, and included cities of the size of Milwaukee and Denver. I also believe one of his companies was at Nebraska City, but I am not sure. There were 12 companies that had an average of 251,000,000 feet of sales. I am not absolutely certain whether Nebraska City was one of them or not.

In 1907, according to the company's actual experience if there had been a 20¢ reduction in price and a 2½% occupation tax, the reduction in revenue would have been $40,357.35, if there had been no increased output. I think about 7% would be a reasonable rate of interest on the company's invested capital here. , I recommended 6% in Iowa in the Cedar Rapids case. It struck me this morning that 7% would be proper here, though 6% at the start with the idea that there would be growth might be right. An item of between $8,000, and $9,000 to take care of depreciation would be reasonable. I would regard $10,000 a little high.

In 1906 if there had been a reduction in price of 20¢ and the 2½% occupation tax had been effective, the reduction in revenue would have been $34,567.65, if there had been no increase in the output over what was actually sold. I predicted what would take place in the ensuing year of 1908 with certain economies put in instead of taking the past experience of the company, because the result of a reduction in price of sales could not appear in 1907, when in fact there was no reduction. I would have to assume larger sales in that year if I had assumed the rate of $1 in force. I could have predicted what
savings there could have been at the new rate if it had gone
199 into effect in the year 1907 and assuming larger sales just as
I did in 1908, and could have taken the company's actual condition at the date the rate went into effect and I would then have made my predictions on the possibilities as I found them for a period of time nearer and not so remote from the date when the ordinance went into effect. It would have had a greater bearing on the year 1907 but not on the prospects of the four or five years during which the ordinance is supposed to operate. I haven't studied at all the effect on the payment of interest on the bonds. I have only considered what was a reasonable return on the structural value. I considered the structural value to represent the investment.

I predict that the sales of the company will steadily increase and the efficiency and permanency of the plant would be better and the element of depreciation would lessen as the company reached an equipment that was adequate to the city, and more nearly standard in its character, and I don't pretend to say that the requirements of price would necessarily be the same in 1907 to the company that they were in 1908. It changes year by year. I took a year which was remote to the extent of one year from the date of the effect of

the ordinance. In order to make the equipment economical and meet the requirements of the plant like this it is essential that the company have credit, and favorable earnings in relation to the invested capital must be shown in order to command money for investment. I believe that a gas property that earns 7% will sell at par. In the East 5% will make them sell at par. I do not know that the McMillan organization is any stronger than the U. G. I. McMillan's connection with this company gives it a larger financial strength. I could not compare the company to the larger and better known company known as the U. S. Gas & Improve-
200 ment Company. I am not aware of what the McMillan stocks have sold for for the last eight months. All stocks have been low during the last year, I know. In ordinary years they undertake to place value on stock as low as 7%. I do not know how it is now. I know this from a careful study of all the gas stocks sold on the New York market, before the panic.

In connection with the New York Consolidated Gas case I made a report and found that stocks that had been earning 6% and bonds that had earnings of 5% in all the leading gas companies except Buffalo had been selling at par for the previous two years. That netted the investor only five or six per cent. That is what they actually drew in dividends. That is true with the U. S. Gas & Improvement Company stock during those two years. That was in 1907 and up to October, 1907. The panic came soon afterwards. I don't know the market today. If that stock actually returns 8% to the investor it is a good exception to the rule. Buffalo was the only exception when I made the investigation. I do not think I erred in that, but I do not know what it is now. They have outstanding stocks all the time. I do not deny at all that they return the investors 8% dividends. The stock was selling usually in the market at a premium.

A year ago Buffalo was the only company out of 30 or more companies that did not sell at par on a five and six per cent dividend. In most of those cases they made no showing at all of additional earnings, over and above what was withdrawn in dividends. They were dealt with in the stock exchange without knowledge of more than the declaration of dividends and interest. The U. G. I. and most of these companies does not give full reports. I do not know whether any of those companies that sold at par on a 6% dividend, in fact earned a larger additional dividend that remained in the plant. I have not got the information. I think some of the companies did but which ones or how much I do not know. I freely concede that no particular year can be taken as a basis and where I used statistics I take all the experience that I can get. It
201 would not be a very hazardous commercial enterprise in a business of this character which has to deal with municipal bodies and is subject to the regulation of rates to distribute in any year all of the earnings and dividends if the company had what I would call a sound financial status, and was not trying to earn more than they could justify in a rate case as the structural value.

I do not think the people are essentially unfair and unjust in regulating rates. As soon as they know the facts I think they are quite generous to corporations. I think that if a company showed that its entire earnings for the year were distributed in dividends and were all required to distribute a dividend of 6% that such a stock would command the money of investors in this business anywhere in the world, and in this country. There has not been a single stock or bond issue in ten years by a single Massachusetts company that has not been authorized and the rate fixed and there has not been a single issue on more than 6% basis, and they do not allow it. If the stock is paying 16% they will fix a value of $200 or $300 below which it cannot be sold and the bonds cannot pay generally over five, never over six per cent, and all of the gas companies in Massachusetts have financed themselves under these orders of the commission for years. The dividends and interest do not amount to over 23¢ a thousand feet but they may put back into the plant some additional surplus. I think in actual practice it is practical to run a plant of this character on a basis that consumes all of the earnings in dividends, but I do not think that it is necessary under my testimony this morning except for about a year while the ordinance would presumably continue for several years. I would presume that this ordinance would continue for a period of five years because rates are not changed, generally speaking, in the United States by city councils oftener than that. They are not changed anything like as often. As a matter of fact, the company could probably stand a cent or two cents reduction each year as its present output increases. As a practical matter councils
do not attempt to reduce every year or two. The standard
202 of quality is also subject to change.

I know of Prof. Marks who suggests, I think, something like 8% earnings necessary to make the stock pay, but I am not sure of the 15% which he suggested. I thought it was intended to take care of other things—depreciation, etc., and he has taken that back in the last few years. In the latest edition of his work he says it applies only to small companies. I have it but I have not read his later edition. It was discussed in my presence a good deal in New York. I will take your word that the standard of 15% has not been changed in any of the later editions of his work. He has been on my side of these cases and has been letting his services to pound down rates. He was associated with me in the New York case and the Buffalo case. I do not attempt to swear to all of his conclusions nor he to mine. He is not as good an authority as the authority I quoted from in Latta's handbook. As an engineer he ranks a good deal above Mr. Latta. The gas that may be wasted through pressure after it has passed through the meter would cut no figure in the company's net waste. It would merely be a booming of the sales. I do not have very much knowledge of the burner equipment compared with the burners formerly in use. I have heard it discussed a great deal, and I have used gas burners all my life, but I am not an expert on gas burners. There is a burner for fuel consumption that mixes air with the gas before it is burned. I have

one in my own gas stove and they are in common and general use and regarded as the best appliance, and, generally speaking, the mantle burner has taken the place of open gas jets for illuminating purposes and is more efficient and these mantle burners also have, I think, devices for mixing air with the gas before it is ignited. I think that you would find one-half of the burners in this town without Welsbach mantles. They are used more constantly. However, it varies wonderfully in different cities. It is astonishing what a difference there is in that respect. It depends somewhat upon whether or not the policy of the company is aggressive in
203 their business campaign. If they attempt to make the gas attractive and up-to-date, the community will adopt the mantle burners. A high pressure then ordinarily is an advantage where the gas is mixed with the air before being ignited, and it increases the efficiency of the gas. It is found desirable to have the pressure higher now than formerly when the open burner was used. The results are better, on the whole. Just what brings it about I do not know but it is the general agreement among gas men that the pressure should be a little higher than formerly. One and a half inches of pressure will work pretty well but two or four inches is considered about right among most gas men. I was speaking of a minimum for two inches. Doubtless the average would be somewhere near two and a half or three inches. In an ordinance you have to allow for the necessary fluctuation of pressure. You have to allow something to come and go and while two and a half or three inches would be better than either four or two inches you have got to have some margin. I was told by some one when I was at the works that at that time the pressure went up to seven and a half at the city hall. I may not have understood it correctly. I have been trying to get the records for some time and they have just arrived. I have not examined them yet. When the consumption reaches the peak in this system I would think that it would be impossible to give an adequate supply through some of the mains without approximating the pressure which is reported. Where 65% of the mains are 2-inch mains I would not be very much surprised with such a result at times. A low pressure at that time would not give an adequate supply to the burners. Seven and a half is high and it may be that even with the present mains they could get along without going as high. I would not say positive. Actual experience would be the best test and the local engineer and judge of the distribution would be able to inquire into and inform himself of the condition. He is the man to whom the complaints of inadequate supply would come. You could require the company to
204 keep its pressure below seven and a half and leave to them the means of accomplishing it which would, of course, require the investment of some additional capital. The waste of the gas in this plant rose as high as 16.56% in 1906. Extraordinary circumstances or occasions might increase that outside the leakage of mains. There might be a broken main or pilfering or secret tampering with the mains. That occurs very rarely in communi-

ties, though. I have never known it referred to in a single case but, of course, it could occur.

The gas unaccounted for here includes the gas that is stolen and that might be discovered and credited. In 1907 it was reduced to 11.84%. I have no records of the pressure at the holder that I am aware of. By increasing the pressure at the holder it is possible to deliver a great quantity of gas through the same main. The leakage should be proportionate to the extent of the main in a large measure. If you make a delivery of a greater quantity of gas through that same main that would tend relatively to lessen the loss per thousand feet. It would distribute the leakage over a greater amount of gas. Leakage may be due to broken mains, leaks from explosions, or fires. They would cause a great deal of leakage and they are unavoidable. I do not mean to say here that property acquired by the company on credit does not constitute a portion of the invested capital. If $50,000 worth of supplies are unpaid for and the company owes for them it has nevertheless that amount of invested capital in its business. Other companies where similar accounts have appeared do not pay interest on these accounts payable. They merely buy on credit for two or three months which they were granted in buying. So far as this company pays interest that should not be deducted from the working capital. As an item of invested capital it ought to be deducted rationally. As long as the company does not have to pay interest I do not see why the consumers should have to pay it. The operating expenses for 1906 are given as $127,000. That would be a little over $10,000 a month.

The floating indebtedness of $50,000 would not be covered
205 by the current bills of 60 days credit. I have no definite knowledge to warrant apportioning any part of this $50,000 accounts payable to the electric department, nor the $35,000 the previous year.

To keep the company in good credit it is essential that a company of this size should pay their bills more promptly so that $50,000 in bills are not accumulated. If that is for gas alone it is too high, and it is a little too high for both the gas and electric departments. $20,000 for the gas department alone would be a more reasonable allowance. It is very common for companies to have too much credit in buying supplies, and they often have, and it is to their interest to have, cash on hand to discount the bills the same as the successful merchant does. I think they could save money by having all of that capital to pay out at the time of delivery. I would think instead of having an indebtedness of even $5,000 they should keep a credit balance of $5,000 or $10,000 constantly to meet the bills on hand. Yet it is essential that many companies of good standing do have a whole lot of outstanding bills. So long as the company pays interest on the item of working capital I should not deduct it. I would deduct from it the part that they do not pay interest on. If we allow for 60 days' supplies according to the way I figured it at $10,000 a month for total expenses, that would amount to $20,000 and in addition we would still have to have a large amount in equipment from time to time, and current supplies and so much money

invested in wagons, horses, pipe, fuel, and oil, which must be had to carry on the business. That property, of course, is physically valued and subject to a tax burden, and if the company had the money on hand and had that equipment free of debt it would have to be accounted into the invested capital.

I have adopted the fairest method I know of in calculating the physical value of the property to ascertain what the necessary invested capital is, and the physical value of the supplies on hand necessary to carry on the business must be included, but against that there is a set-off. It would be desirable and convenient
206 for the company to carry a balance credit of some five or ten thousand dollars in the bank for the purpose of meeting its bills. That is a legitimate part of its invested capital if it has it there. It is true that unless the town has been pretty thoroughly canvassed already that upon putting into effect a reduced rate of charges good business judgment required the company to employ more men in the new-business department, and increase the promotion costs in order to by expanding sales in a measure compensate for the reduced price.

It is quite common for companies upon the taking effect of a reduced rate to canvass over the patrons and endeavor to induce them to employ new devices and use the gas for new purposes. I would advise it for a few months and then I do not think it would be necessary any more. The immediate effect would not be to increase the promotion charges in view of the amount this company has spent for it. I think I could decrease them here under those conditions by the end of the first year. I would not advise it to be reduced for the first six months, but then I should reduce it. I would not advise it to be increased above the present expenditure in those first six months.

As to the reduction in lost gas no one could tell whether you could reduce it or not in any given year, though the company itself has a lower leakage and unaccounted-for gas in 1903. Then it was 6.84. I allowed in my computation 7%. ½¢ a thousand for legal expense in a town of this sort is not much of a difference. I am entitled to take the average experience of the company on legal expenses for several years. That gives a better idea.

No one man can estimate with any definiteness what the experience of the company concerning litigation will be. This company may go along under normal conditions and pay an attorney a thousand dollars a year to look after its work, and then a year will come where extraordinary demands *is* put on the legal department and they have to hire assistants and take evidence and sometimes employ experienced engineers to testify and pay them money for it. I do not know whether conditions of that kind will arise again or not and when they do arise they will have to be taken care
207 of. With an increase in coal gas from 59,000,000 feet in 1905 to 69,000,000 feet in 1907 I do not think the retort house labor for coal gas would ordinarily increase 60% per thousand feet. It is true that the efficiency of stoker laborers varies but it ought not vary anything like that. Sometimes new men have

to be employed without experience and that reduces the efficiency of the labor. Sometimes they reduce the number of men working in that department and make a small amount of gas and that relatively reduces the efficiency of the labor, and these are variations that will necessarily manifest themselves in an item like that.

The credit for all the residuals in 1907 did not appear in the report of the cost of gas. It was not in the total operating cost per thousand feet of 79¢. Some time in the years to come when they adjust their stock account it will all appear, but as to the year of 1907 I do not think the profit fully appears. Part of the stock that is entered in 1907 may have been on hand at the beginning of the year. I think there should be a yearly adjustment and there apparently was not so as to cover the net profit or loss from the stock account into the operating expenses. It is quite possible that some years had a higher operating expense than appears in these reports. But the making of the adjustments this year might do an injustice to the previous year. In order to make it apply exactly each year there should have been an adjustment made at the beginning of the year as well as the close, and that is what I did practically, by taking the entire amount made of tar and coke and following it through to the amount sold or used. That was not very different from the amount made. It was not enough, as I said this morning, to materially affect it.

In my calculations I took for the basis the present depreciation value of the property and in another calculation I took the company's inventoried value, and in expressing what I thought was a fair depreciation I went back to 4¢ and at the same time I gave the consumers the benefit of the interest upon the depreciation reserve.

In doing that I took the figures that I thought correct and
208 they counted most strongly against the company. If you are going to allow the depreciation upon the decrease in value from time to time and if you are going to allow that per cent on the reserve fund theory, it will only be sufficient at the end of the period to replace the depreciated value and when you allow depreciation only on the depreciated value, when you come to the end of the 50 years or 30 years or 20 years, there will not be sufficient money in the depreciation fund to reconstruct the property or the buildings as it originally was. You would only get the present value back. The investor is entitled to have his invested capital kept intact for the whole period provided he has not eaten his cake as he went along as this company has done. If they have not saved their reserve fund they cannot ask the consumers to make up what they have used up in the last 40 years.

The proper basis would be at the outset when the plant was first constructed to set aside the necessary amount the first year and continue through the life of the plant and in that way the investment would remain intact. The company by some means should preserve unimpaired its original invested capital. The company could more profitably invest its sinking depreciation fund in the extension of its own plant than it could by putting the money in the savings bank or trust companies, and then it would have a com-

plete guarantee against loss. I can give in a general way the process of the manufacture of coal gas but I would not attempt to do it in its full details. I do not pretent to be competent to draw plans for a gas works but I can give you a general idea of the process. I would not attempt to describe with technical accuracy and precision the process of making coal gas including every process of distillation of the coal and every equipment for purifying, scrubbing, and putting it in the holder, nor would I attempt to describe the different machines employed in every detail of that process. I would not even attempt to describe the bench or oven and its processes complete. I know where the coal is put in the bench. The furnace coal is usually put in below and the coal put in at
209 the mouth-piece. Sometimes it is put in with machines. They usually put in coke below at the floor underneath the retort. I don't think I described any process when I was in the plant to Mr. Adams and Mr. Stewart. I hardly remember what I described. I guess I pointed out the ash pits down there but I did not pay much attention to it. I saw afterwards what I had done.

I do not think that a 50 year term of life for any mains in this particular locality in view of the experience of this company as I have gathered it from the testimony is altogether preposterous. I think that while 75 years would be long if there is serious danger to the mains from the soil and electrolysis, I remember what I have seen of the testimony and heard of it, and I am willing to concede that 50 years might be reasonable in view of the doubt as to the soil and electrolysis, but I would consider anything less than 50 years absurdly low. I take into account the question of inadequacy except that the 2-inch mains have already depreciated on account of inadequacy about as much as they ever will. There will not have to be a very large amount of 6- and 8-inch mains replaced on account of inadequacy. There will be some but those mains will be supplemented by mains on the other side, as I said this morning, and in some cases by removal.

I never knew of a company that had so short an average life for street mains as 15 years, not even for inadequacy. There might be individual lengths half a block or a block but I am talking about the mains as a whole. I have been through the rapidly growing western towns a good deal. I have lived in the west a good deal. I have seen them grow pretty rapidly and I have seen the testimony in many of these gas cases. They have grown especially rapidly in Cedar Rapids. Saginaw has not grown so fast. For the past seven years I have been superintendent of the Cleveland waterworks which is operated by the municipality, and that is my first experience in the actual operation of industrial enterprises of this sort, and my first experience in actual industrial operation and manage-
ment. I am 48 years old. Prior to that I was engaged in
210 statistical investigation for a few years, and prior to that I was a school man. Tom Johnson is the Mayor of Cleveland. He is a great advocate of municipal ownership and makes it a political issue, though the water works there have been owned by the city since they started in 1855. I have in my office two or three com-

petent engineers. I am not a practical engineer and do not claim to be, and the work of the architect and engineer in my department is largely done by the engineers. My work is more supervision, statistical, and keeping the costs and looking after the work and seeing to the appointment and efficiency of the men and a great many questions as to the policies.

I think my views on the subject of municipal ownership and reduced charges for public services were all printed before Mr. Johnson ever thought of them. I suppose because of my view being kindred to his own he called me to his service when he became Mayor of Cleveland. We had been personal friends for some time and I suppose that they all had an influence. I was on this investigating committee for the National Civic Federation and that took about two years. It took about one-third of my time each year and I also made a study of municipal street railways and lighting companies at Chicago for the State Board of Labor. I was on that board but I do not think I was a partisan, but I was known to be friendly to municipal ownership as against private enterprise, and I have always appeared in the interests of the cities to sustain reduced rates in the same way that gas engineers have appeared in the interests of the companies. I suppose that I appeared in this case just about the same as a gas engineer would appear. I suppose there is very little difference and I do not know that there is. I appear here for a compensation to be paid by the city. I do not know whether I am to receive what the lawyers would call a considerable compensation or not. I have done considerable work of this kind in the few years. I testified against the Consolidated Gas Company of New York. That case has now gone to the
211 United States Supreme Court.

I testified in the Des Moines case 15 years ago, I think. When I was making statistics in research work for the government I simply did some work three or four different times for the Department of Labor, but I was not studying the gas question then. It was the question of labor. They sent me to Europe in 1900 to study technical questions under Mr. Wright's administration. That work did not pertain especially to the gas problem. When I worked for the state of Illinois I was under the board of labor. I made an investigation in 1896 and 1897 and that is the only work I ever did there. I lived in Chicago then and I had been there for some five years and knew the situation pretty well and lived there during the several months that I made the investigation. I do not think Chicago, New York, or Milwaukee would furnish any particular analogy to Lincoln, but I suppose you could get a good many things in those cases that pertained to a case like this, but the ultimate results would furnish no close analogy. I worked in Montreal, but that was a much larger city with a much larger gas plant. Authorities differ as to whether Murdock or somebody else started the process of manufacturing gas, but it was started in England and France about the same time, about the beginning of the 19th century, along in 1800 somewhere. The process was known and was beginning to be developed, maybe, in London, and other places in the 17th century.

EDWARD W. BEMIS, recalled for further examination, testified on behalf of the defendant, as follows, pages 422 to 426:

Redirect examination by Mr. Stewart:

I have examined Exhibit 144, the automatic gauge register of pressure, and it indicates that some time every day between four and six in the afternoon the pressure exceeds 7 inches. That pressure makes the gas blow and increases the leakage. It may be a necessity in small mains but it may not be necessary that the mains should be so small. There is a tendency of late among gas companies to put in re-enforcing mains of high pressure to take gas at 10 point
212 pressure from the works and tapping it into the supply mains and use an automatic governor that will reduce the pressure to what they want in the mains. With the mains being so small it is less expensive to lay them than to lay the large mains. I meant to say the $7,000 would be a proper allowance of depreciation on this plant. That is what I worked out in my figures this morning. In figuring this depreciation I did not allow for scrap. That makes my estimate all the more conservative because there would be some scrap at the end of the life of the plant. So far as the earnings that should properly go to depreciation have been paid out in either dividends or interest on inflated capital, to that extent the company is not entitled to collect it over again from the consumers, nor for money to pay for plant depreciation. They are only entitled to current and for the future depreciation.

The repair account of the company for 1907 was about ½¢ per thousand feet higher than the average of the previous four or five years. It would be referred to as higher and indicate that the repair account is not likely to increase in the future. Five or six cents is a normal amount in other companies. In my depreciation I figured that all renewals of the retorts or settings and all tools renewals and keeping up of office supplies and furniture and repairs that is not absolutely displaced, or meters or services and mains, and machinery and buildings, and anything along the line of maintenance would be taken care of in the operating expense by way of replacement, repairs, or renewals. All of the items that are necessary to keep the plant up in good shape and physical condition I figured would be paid out of the operating expenses. That is all included in the 6¢ repair item of this company, but where the whole unit is renewed outside of the failing or the retorts and where anything like an entire setting or where you get a new machine in place of an old one or new length of pipe to take the place of the old one or a new meter, then it ought to be charged to the renewal account, which is
213 the fund set aside for depreciation to re-build those units. But when an 8-inch main takes the place of a 4-inch main you should charge off its depreciation at that time only the cost of the 4-inch main taken out, and charge the new 8-inch main to construction. I think that is the way this company does at the present time.

From the testimony which I have heard on the water mains I would say that in the last three or four years there has been very

little electrolysis on the water mains near the power house, and there would be no more danger to the gas mains. There is very little difference so far as the electrolysis is concerned between gas mains and water mains. The water mains are likely to catch it a little the worst because electricity finds water a good conductor and if two mains of equal size were side by side there would be a little more electrolysis through the water pipe after it jumped through the joints or when it left the pipe. It would affect it whether it was water or gas. If there was a little more electricity in the water mains they would get a little the worst. The eight Massachusetts companies had an average of 2,690,000 ft. of sales per mile of main last year, and the Lincoln company had about 2,900,000 ft. of sales per mile of main, or about 10% more. There were five out of eight Massachusetts companies that were included in that study of unaccounted-for gas that had lower sales per mile than Lincoln yet they had an average leakage of only 6%, or 151,000 ft. per mile of main. I used 1907 in making my computation because that was the latest year. I understood 1905 would have been more favorable to use as far as the city was concerned for a considerably lower operating cost, but that was a year in which an inferior quality of coal, I am informed, was used, and they had to use a better coal later. 1905 would have been a fair year so far as the cost of coal was concerned. The average cost of the coal per thousand feet of coal gas made in 1905 was 58.49¢. In 1907 it was 69.31¢. In 1905 the cost per ton was $5.09, and in 1906, $5.68, and in 1907, $5.95 as they charged it. I understand, however, that that included considerable labor of handling and that the
214 actual cost F. O. B. cars, in 1907 was about 50¢ less. That is accounted for, I suppose 10¢ for unloading, perhaps 12¢, and I do not know where the rest of the expense of handling is. The natural growth of the city should be taken into consideration as tending to increase the consumption as well as the reduction in price in attempting to secure new business. It would cut considerable figure. This year, by not making any allowance for the four gallons of tar that was allowed to run to waste last year they saved about eight gallons which even at 2¢ a gallon for steam purposes would amount to 8¢ a ton of coal carbonized. It would amount to at least one-third of a cent for water and coal gas sold and would bring my 24.69¢ up to 25¢ profit on dollar gas. Giving the company its claims on inventory valuation and 50 years' life for the mains, it would make 23¢ instead of 22.69, making those figures approximately 25¢ and 23¢.

Recross-examination by Mr. Rose:

There are advantages to the consumers in having the management of the electric and gas departments combined and in getting a consumption for the tar, and there are also advantages in dividing the cost of administration between the two departments. On the other hand, there is likely to be less competition in rates and to that extent the consumers would not be benefited so much. However, if municipal regulation took the place of that it would tend to economize the cost.

Pure distilled water is a conductor of electricity. When you say pure distilled water I don't know just what you mean. The ordinary drinking water such as flows through the water main is a good conductor and I am not informed just what would result from your claim of pure distilled water. That water that most cities have for drinking purposes—ordinary pure water—is an excellent conductor of electricity. Pure water does not have impurities in it that bacteriologists would consider bad for drinking or for cleanliness. It is not absolute free from all bacteria or chemical constituents and solids in solution but these are not deleterious to health necessarily. I have never had occasion to ascertain and determine whether or not pure water free from anything in solution was a conductor of electricity but I did not suppose there was any difference. I don't believe there is any. If water that contains impurities and solids in solution only is a conductor of electricity I am not so sure but that a water main would conduct it through the iron just the same, whether the water inside would or not. I don't believe the water would be as free a conductor of electricity as the iron. I think it would have been fully as much as the gas. 12 gallons of tar per ton of coal is the average production. That is not the maximum that is reached in any plant and does not run from that down to 8 or 9 gallons, according to the coal that is used. 12 gallons is considered a normal output for a company that pays attention to it and tries to save it, using Youghiogheny coal. I don't know what they can get from Kansas coal. I think the market for tar is most likely in a city for local purposes and for steam as it is used here. Of course, in some eastern cities they are able to sell it. They sell it in New York, but I don't know as Lincoln would find it profitable to send it off. The company says it is worth 2¢ a gallon for fuel, and that saving is really made because the two plants are combined. At times in the past they have charged themselves, until recently, three or four cents for it.

215

216 C. P. WALTERS, being first duly sworn testified on behalf of the defendant as follows:

Direct examination by Mr. Stewart:

I am Clerk in the water office in the city of Lincoln and have been there for four years. There is a gauge for the testing of gas pressure in this city. It is an instrument by which a constant record is kept of the pressure of gas in inches. It is located in the City Hall. It is about ten blocks or three-fourths of a mile from the gas plant. The gauge registers automatically, on a chart prepared for the purpose. Exhibit 144 contains a record of that instrument from December 28, 1907 to March 31, 1908. The figures at the top of the chart are the hours of the day, and the tracing appearing irregularly over this chart is a line made by a pencil which is held in the machine for the purpose of recording the pressure. The figures on the left hand of the chart indicate the number of inches of pressure and the seven at the top indicates seven inches, and the record made by this chart

is made each day during this period. When the gauge goes beyond the top of the chart it indicates a pressure higher than seven inches.

217 H. F. PETERS, being first duly sworn testified on behalf of the defendant as follows: Pages 426 to 429 printed record.

Direct examination by Mr. Stewart:

I reside at 2803 Holdrege street, Lincoln, Nebraska. I have lived here for 19 years and I am in the real estate business. I have been in the real estate business for 16 years in this city and I am somewhat acquainted with the values of the real estate in the vicinity of the plant of the Lincoln Gas & Electric Light Company. I have property in Lincoln for sale down there and I have had occasion to familiarize myself somewhat with the values in that vicinity. The reasonable value of the block of ground per lot whereon the electric and gas plant is located, is about $300.00 a lot without the buildings.

Cross-examination by Mr. Rose:

There is trackage to these lots, and I don't think that effects the value of the property. Where a man starts an institution of that kind, if he needs trackage, he generally gets it, I think. I could not say whether lots having trackage facilities sell higher there in that community than those that do not have trackage facilities. I think the lots there were higher in the boom of 1888 than they are now. I think there are twelve lots in that block. I do not know what lots in that vicinity, between the gas company's plant and the passenger station, with trackage facilities, have sold for recently. I could not say whether they have sold for as high as $1,000.00 a lot or not and I don't think the trackage facilities in that location effects the price.

Redirect examination by Mr. Stewart:

If a party locates a manufacturing plant or something that consumes large quantities of coal or other material, in that section of the city, they can secure trackage facilities without expense. The railroad will build to them without charging and that is the reason why I say it does not add to the value.

218 Recross-examination by Mr. Rose:

I remember two years ago when I was interested in a mill that was built at Fremont, we first talked of taking the old mill that was built on 27th street, and the Burlington road offered to run a switch track over there without any expense to us. I do not know whether they would not do that for the Gooch Mill Company or not. That was a $40,000.00 new mill. The mill that I spoke of was the old Conn mill. It is on the Northwestern and about four blocks from the Burlington. It had trackage facilities on other roads, and is at least four blocks from the Burlington. The Rock Island does not run to it, neither does the Missouri Pacific. I do not know whether the Burlington required this year a payment of $4,000.00 as a condition

for going into that same mill for Mr. Gooch. I have not posted myself as to whether or not they would go in there free. We were figuring on a 500 barrel mill and that is what we built at Fremont and we expected to make that out of this one. I could not say what officer of the Burlington offered to go in there free for us. I was the man who had charge of it. Mr. Royston was interested in it and told me about it. He went with him but the man that told us was the man who looks after the leasing of ground. We also went over there on North 14th street and looked at some ground there and they spoke about putting in a switch if we wanted it.

219 A. S. TIBBETTS, being first duly sworn, testified on behalf of the defendant as follows: Pages 429 to 445 printed record.

Direct examination by Mr. Stewart:

I have resided in the city of Lincoln something over 27 years and my occupation during that time has been the law business. I have interests in other businesses. I am a director in several corporations and am a director in the City National Bank, and I have been fairly well acquainted with the prevailing rates for money for the past few years, in this city. For temporary loans the rates run from 4% to 8% varying a good deal according to the size of the loan and the responsibility of the party. Large institutions generally have borrowed at about 5% or 6% in the last few years. The current rate on municipal bonds and other classes of bonds has been from 4% to 5%. I have an opinion as to the value of real estate in the vicinity of the gas plant and have known of property being sold in that locality and I have sold some amount of property myself there, and I believe I could give a pretty good opinion of the reasonable value of the property there. I would say that the twelve lots of the Lincoln Gas & Electric Light Company at this time are worth about $250.00 a lot. I am also acquainted with the cost of organizing corporations as an attorney in this city. I would say that $500.00 was the reasonable cost of examining the titles to real estate, preparation of certificates of incorporation, mortgage bonds and matters incident to the organization of a company such as the Lincoln Gas & Electric Light Company would be. It would depend a little upon the amount of capital put into the business, but with my knowledge of the plant I would say that the local fees of an organization of such a matter would be in the neighborhood of $500.00. For the attorneys fees for the first year, in addition to the organization charge, I would say that $500.00 would be ample. There might not be any services at all except advice; if a person was engaging for the corporation and it was new and had not gotten into any difficulties except what
220 could not be avoided in the organization, I would say that $500.00 would be ample. A corporation of that kind where they have no litigation damage suits, could engage a good attorney for that amount. Most any of the attorneys here would undertake to do it for that unless they had some reason for not doing it. I have had certificates of stock engraved and I presume bonds also and I have an idea what it would cost, that is, what has been paid

for those things and my opinion is that 300 bonds would cost $100.00 or $150.00, possibly $200.00 for the engraving. It depends upon the quality, and it would be about the same or possibly a little less for stock certificates. The trustee certifies to bonds and makes any transfers that are necessary. If the transfer- of the bonds are to be made upon the books of the company, and the work incidental to a thing of that kind is very small, and the only thing required is reliability, the trustee could not be held *expect* for some misconduct of his own which might arise. A reasonable sum to be paid for a person acting as such a trustee, in the first instance, would be $300.00 or $400.00 per annum, then the work accruing after that depends upon the number of transfers and I could not say that there would be anything that would add anything to it. A couple of hundred dollars for the first year would be sufficient, it seems to me, that is, supposing that the transfers are made from the books of the company and the bonds are not transferred by delivery.

Cross-examination by Mr. Rose:

I have never put out a bond issue of upwards of $1,000,000.00 with a large industrial organization. There are very few that have done so here and I don't think there has been enough of that work here to make a market price of the legal work. I don't suppose there ever was one organization in this town with an issue of bonds of $1,000,000.00 where the work was done here, but they all know what such work is worth, what it would be worth here. I suppose that work has generally been done by New York attorneys. It was not done here.

221 Only these large municipal corporations have anything of that kind. One of the street railways here had its organization work done by John H. Ames. If he charged a fee of $2,500.00 for drawing articles of incorporation, he charged five times too much. It was a graft. I do not know what the cost of that work was in his case, and it is not a matter of general publicity that he got $2,500.00 for the articles of incorporation which did not involve any bond issue. I have examined one of the trust deeds pledging properties of a varied nature of the Lincoln Gas & Electric Light Company, which saves to the company its right to make replacements and protects in minute details both the company and the bond holder and the trustee. These instruments are more common than ordinary deeds and they are more voluminous also. In protecting all of the rights of the parties in common, the instrument itself makes up several pages of legal cap. Ordinarily it does not amount to several hundred printed pages. Ordinarily the trust deed that secures the issue of a million and one-half of bonds of the Lincoln Gas & Electric Light Company, ought not to require several hundred printed pages.

I don't know in detail what the requirements of a trustee of good credit in Chicago and New York are, but I know what requirements he ought to have, and I don't know what his particular requirements are with respect to the conditions of such a mortgage before he will accept the trust. It would depend upon the trustee. Any of the

trust companies engaged in this business would require that the conditions of the bond be examined by its own attorneys and approved and would require the company to pay the cost of that examination, but if it was done here there would be no necessity for that. Bonds of that amount have not been floated here up to this time on individual enterprises. In order to have them placed on the market it would be necessary to have a trustee that had a reputation. I have never seen any of the lithographic bonds with the coupons annexed of the Lincoln Gas & Electric Light Company, but I have seen those of similar companies. I don't know anything about how many words there are in one of them nor how many coupons there are attached.

222 If the bonds run forty years, it would make at least forty coupons. I don't know how many full sheets there would be required for lithographing. I could not tell you and do not know how many plates the bond for forty years, secured by a voluminous trust deed and containing the recitals of the trust, would require, but I suppose the cost of the lithographing would be affected by the number of plates, and I could not tell the cost of the plates without knowing the number of words there were upon it, but I give in a general way the fair cost of lithographing in corporations that I have been connected with, where they had lithographing done; but I don't think my evidence in regard to lithographing amounts to such a great deal and I would not want to guarantee my prices on that.

I don't think there would be much call for the services of an attorney with a company that was being organized and was expending in the construction of the plant from $800,000.00 to $950,000.00. An attorney would not be required for its contract with the city and its contractors and would not be needed to arrange for the opening of streets nor in connection with the hiring of men and manufacturers, for pumps, gas holders and machinery. He would not be needed in carrying on that work and drafting the contracts, looking to the enforcement of contracts, advise as to getting the streets open, going before the city council and getting permits and things of that sort. I don't think there would be much call for an attorney in that work. It would be possible that an attorney might be called upon for extensive advice, but I don't think it would be probable; or it might happen that a man might be killed or injured in extensive operations of that kind, but in that event the attorney would make separate fees. The executive manager, in administering and carrying on a construction enterprise of this magnitude, might ordinarily have the counsel of a competent attorney, to guide him in the prosecution of his work and in the execution of his contracts and to advise him as to liabilities of the company as they arise from time to time, but in general practice they generally

223 make their own contracts without seeing an attorney, unless they have an attorney hired by the year, to whom they can consult just as well as not. There has never been a situation in the history of this city where this amount of money has been expended by which that custom could grow. I never knew of a case in this city where the contractor in the execution of a mere paving contract

of much smaller magnitude than the amount involved in this case, has ordinarily expended large sums during the year on construction work, solely for attorney and counsel fees. I know that Buckstaff claimed he paid $5,000.00 to some party for attorney's fees. I don't know what he paid to Whedon & Mason, but he might have paid that. I don't think Murphy paid a great deal, nor do I think the Barber Asphalt People paid Frank Hall and Pettis a great deal. I would say $500.00 is a large sum for counsel fees, but larger sums might be paid under certain circumstances where the company had to call upon attorneys to protect them in the matter of damage suits or things of that kind. There might be paid many times $500.00 when the magnitude of the work is contemplated, but that would only be a possibility.

I should say that the Lincoln Gas & Electric Light Company has credit which will enable it to borrow money to meet its notes at the rate of 6% or 7% in this community. I do not think they have a credit for that amount. I know that they have offered $100,000.00 of short time notes, giving a trust pledge of its bonds at double the face of the notes and have been unable to place them. I do not know the amount exactly and my recollection is that they did not offer 7%. I do not recall that they offered any bonus of 1%. There was a time here when no company could borrow $100,000.00. If they had pledged their bonds I do not see why they could not get the money before October 28, 1907. My recollection is that they offered some notes last summer and I don't know that they could not place them with the banks or with private individuals in this town. I think some of them were placed.

224 I don't know upon what terms the American Light & Traction Company sold its notes a year ago. It may not have been a very good financial institution. I know what Armour & Company and Cudahy Company sold their notes for. They go away into the millions. I can tell what Raymond Bros. Clarke Co. and Miller & Payne borrowed money at. Assuming that the American Light & Traction Company was in good sound financial condition and a worthy institution, they could have floated short time notes a year ago, before the bankers' panic at less than 7% and a commission for placing them of 1%. If they had good credit they could do it for less. There was in the neighborhood of $40,000,000.00 of packing house paper here in Nebraska last summer at the rate of 5%. It raised to 6% for a little while, but now it is back to 5%. That is a legitimate enterprise and they have good credit. I know that there has been more or less agitation and distrust of gas companies and they have been over-capitalized, and that has had a bad effect on their credit. A company like the gas company here, with its right to occupy the streets questioned in a suit by the city, might go into the market and borrow money today at any price if it was not over-capitalized. If the capitalization was unquestioned and it had no debts at all, I do not see why it should not borrow money.

I know the Lincoon Telephone Company borrows money on their notes at 6%. They have $550,000.00 worth of bonds sold and paying 6% and with the bonds went a stock bonus equal to the face of

the bonds. That was when they first started. There is no stock bonus now. When they started they sold their bonds at 90¢ on the dollar. The stock represented no money paid in at all. It was simply water stock, but that is the way the bonds were floated. When they started $90.00 would buy $100.00 worth of bonds and $100.00 worth of stock. It was an experiment at that time. Nobody knew what it was. That would give some indication of the cost of getting money in this community for gas enterprises. The bonds are still outstanding and have gone into the market and the company can not redeem them at less than par with accrued interest.

225 You can not buy these bonds for less than par now. I do not know that there is anybody that wants to buy any bonds now, even government bonds. The telephone company we consider on a good financial basis, but the gas company is bonded too heavy to have a good credit. I have heard the representatives of the company state on the witness stand the value of the company's property. If it was shown that the bonds of the gas company do not cover the full value of the physical properties in all its departments, I would say that the company was on a good financial basis. I have bought stocks of this kind and sold them myself in a small way lately, but not in the gas company's stock. I never owned a dollar of the gas company's stock or bonds in my life. I have had bonds in the Lincoon Telephone Company and have some stock in that company today. Some of that stock represents nothing but water. I would not be considered an expert on the financing of gas companies over the country. I never was a promotor. I have been counseled by promotors in coal matters and in insurance companies, but not in gold mines.

Redirect examination by Mr. Stewart:

The Lincoln Telephone Company was put in here in competition with the Bell Company at the time when the Bell Company occupied the field. We introduced an automatic service that was considered at the time an experiment and it had to be exploited in the face of strong competition. The Lincoln Gas & Electric Light Company, with something like $1,168,000.00 of outstanding bonds and notes, would be entitled to credit on small current amounts only. It would not be entitled to any large amount. It would not be strange that any company that had bond issue in excess of its value secured by a mortgage or trust deed, would have trouble in borrowing additional money. Any concern borrowing money here in Lincoln in the past few years with a good credit, could get the money at from 5% to 6%. If the gas company was organized on a business basis and had money paid in to show for its investment, it could borrow plenty of money right here in town at 5% if it wanted to.

226 The credit of the Citizens' Street Railroad Company and the Traction Company is good and they borrow money at not to exceed 6% and I think they borrowed money last summer at 5%.

Recross-examination by Mr. Rose:

The New York Central and a good many roads issuing notes, paid as high as 7% last summer. Some of them couldn't borrow money for that because they were bonded for more than they were worth. At that time stocks were tumbling and they lost the confidence of the people and investors and those who were loaning money. They did not consider them safe. That was the reason for the high rates of interest last summer. Since the October panic the high rate has been due to the stringency in the money market, more than anything else. I can not name any one person who did not consider the New York Central good, but one of my clients was speaking to me about investing some money, or had some money invested in railroad notes. I do not know just what railroad it was now, and he did not consider them very good. These notes are not placed here to any extent. I did not ask my client whether he had any confidence in these notes when he invested his money.

I have never testified as an expert financier before, except just what I knew. I know about some of these things. So far as the legal part of financing enterprises of this kind, I think I know, but I am not a financial man. I simply know about the financial matters that are incident to my business and to the part I have had in business. I have pretty intimate relations with the banking business and have had for some 7 or 8 years and have been consulted on the financial part of it quite a good deal. I am not the financial manager of any bank no more than that I am on the Board of Directors and one of the consulting members of the Board. I spend but little time with the affairs of the bank. I know something about the commission paid to financial underwriters to put into the market an issue of bonds of a company like the Lincoln Gas & Electric Light Company. They take just whatever commission they can get.
227 The amount depends upon the institution. Some can place their bonds at a fraction of 1% and others are willing to pay as high as 5%. That is my knowledge. I would say that the biggest financial underwriters in New York would float the best railroad stocks in the country for a commission of less than 5%, but so far as taking an entire issue and placing it, the charge for doing that I am not acquainted with. I would say that there are financial underwriters who would place the best securities for less than 5% and the ordinary securities for less than 10%. I can not tell you who they are but that is my opinion. I have known of underwriters taking propositions to place bonds at 2% and 3%. Municipal bonds can be placed for less than that. A broker offered to do this, but I have known of no one assuming the responsibility of placing an entire issue. I would say that that was a poor way of doing anyhow. I would not know whether it was necessary to do that or not until I had tried and then it would depend entirely upon the corporation. If I wanted to put an enterprise upon its feet thoroughly and get the money and know in advance so as to contract for expenditures, it would be a prudent and safe thing to provide for the entire issue, but I can not say that was ever necessary with the gas company here,

unless to go and organize a new one. If a man has the money to put into the business and to promote a gas company, that ends it.

Redirect examination by Mr. Stewart:

I believe if there was nothing of the kind of the gas company in town today, that we could promote one and get the money and organize here in Lincoln in ten days, if it was honestly financed. I heard the officers of the company place the cost of replacement of the entire plant at $225,000.00 at the trial of the tax cases some time in 1903 and 1904.

228 Recross-examination by Mr. Rose:

I can not tell you who the manager of the gas company was at that time, but he made that statement. William Lawler was one of the witnesses. I do not recall who the other one was. They fixed the price of replacement at $225,000.00.

229 PAUL HOLM, being first duly sworn, testified on behalf of the plaintiff as follows: Page 468 printed record.

Direct examination by Mr. Rose:

I am engaged in the real estate business as an agent and dealer in Lincoln Nebraska and have been for about 22 years and have been active in the business continuously, and have been a large dealer and am acquainted with the market value of real estate throughout the city. I am acquainted with Block 79 on which the Lincoln Gas & Electric Light Company have their plant, and in my opinion the fair and reasonable value of that Block of twelve lots, exclusive of all improvements, and taking into account its nearness to the tracks and many other advantages that it has, is about $600.00 a lot for the inside lots and about $700.00 a lot for the corner lots.

230 S. W. CHENEY, being first duly sworn testified on behalf of the plaintiff as follows: Pages 468 to 469 printed record.

Direct examination by Mr. Stewart:

I am employed by the Lincoln Gas & Electric Light Company as superintendent of distribution. I have had experience in the laying of mains and services for them. I have been with this company for nearly two years and was with the Denver company for about a year, and I have had to do with the construction, reconstruction and repair of the distribution system, which includes the services. In actual practice a ditch 18 inches wide is required to lay a two inch main or smaller and 20 inches for a four inch main. The average depth of the ditch required for services is about 4 feet, and a man in actual practice will dig on an average between 10 and 20 lineal feet of 18 inch ditch of an average depth of 4 feet.

EXHIBIT 4 (EXHIBIT H IN INDEX).

Whereas, this company has been incorporated for the purpose of engaging, and with power to engage in the gas and electric business in the city of Lincoln, Nebraska, and vicinity, all as set out in Article 3 of the Articles of Incorporation, and

Whereas, In order to accomplish the purposes for which it has been incorporated it will be necessary for the company to acquire gas and electric plants, and distributing systems and franchises for the operation of the same, and

Whereas, The Lincoln Gas & Electric Company, a corporation organized under the laws of the State of Nebraska is the owner of valuable gas and electric plants, and distributing systems in the city of Lincoln, together with the right of franchise to operate the same under an ordinance of the Mayor and Councilmen of the city of Lincoln, approved March 12, 1872, as amended by an ordinance approved June 19, 1890, and as further amended by an ordinance approved May 2, 1900, and under various other ordinances of the Mayor and City Council of the City of Lincoln, all of which property, rights and franchises are suitable for the business to engage in which this company was incorporated, and

Whereas, It has been ascertained that the same can be purchased by the company for the consideration and upon the terms and conditions hereinafter set forth,

Now Therefore Resolved, That this company purchase property, rights, privileges and franchises of every name and nature at and for a consideration equal to Two Million Two Hundred and Forty Nine Thousand One Hundred ($2,249,100.00) Dollars, plus all the existing just debts and liabilities of the Lincoln Gas & Electric Company for the said sum of Two Million Two Hundred and Forty Nine Thousand One Hundred ($2,249,100.00) Dollars, to be paid in this company's full paid nonassessable capital stock at par, and the balance of said consideration to be paid by the company
233 assuming and agreeing to pay as and when they shall respectively mature and become due all the existing just debts and liabilities of the Lincoln Gas & Electric Company. The transfer to be made as of date December 1, 1901.

Resolved Further, That the Board of Directors of this company, and the proper officers of this company when elected, be and they hereby are fully authorized and empowered and directed upon receipt of the proper conveyances to this company of the property, rights, privileges and franchises aforesaid, to issue and deliver to the Lincoln Gas & Electric Company, or to such persons as it may direct, certificates for Two Million Two Hundred and Forty Nine Thousand One Hundred ($2,249,100.00) Dollars, fully paid, nonassessable capital stock of this company, and generally to perform such acts, and to execute such instruments in behalf of, and in the name of this company as may be necessary, proper or convenient

to fully carry out and complete on the part of this company the purchase aforesaid, and

Whereas, This company when it has assumed and agreed to pay all the debts and liabilities of the Lincoln Gas & Electric Company as aforesaid will be under the necessity of making proper and adequate provisions therefor, and it is expedient and proper that this company should at this time provide for immediate extensions to, and improvements upon the properties which it will acquire as aforesaid, and also to provide for future extensions thereto, and improvements thereon.

Therefore Resolved Further, That the Board of Directors of this Company be, and they hereby are fully authorized and empowered and directed to cause to be executed a mortgage upon all of the said property, rights, privileges and franchises when acquired, such mortgage, and the bonds to be issued thereunder and secured thereby to be in the form and of tenor and effect set out in the copy submitted to this meeting, and on file in the office of the company in record files as Document No. 3 identified by the signature of
234 the Secretary of this meeting thereon indorsed; and further, that the Board of Directors be generally authorized to do or cause to be done whatever may be necessary and proper to fully authorize the execution, and delivery of such mortgage and bonds as aforesaid.

It being expressly stipulated that in purchasing the property, rights, privileges and franchises of the Lincoln Gas & Electric Company this company agrees to become liable for any claim that one J. C. Van Riper may have against the Lincoln Gas & Electric Company in case he shall hereafter succeed in establishing the same.

"The following was introduced, referring to the action had at the first meeting of the stockholders of this company of all of the property, rights, privileges and franchises of the Lincoln Gas & Electric Company for the consideration, and upon the terms and conditions set forth in the minutes of said meeting of the stockholders, reference to which is hereby made.

Resolved, That the President or Vice President and the Secretary, or the Assistant Secretary, of this company when elected be and they hereby are authorized and empowered and directed upon receipt of proper deeds and conveyances to this company of all of the property, rights privileges and franchises of the Lincoln Gas & Electric Company, to execute, issue and deliver to the Lincoln Gas & Electric Company, certificates for this company's fully paid, non-assessable capital stock, and such other undertakings and instruments in the name and on behalf of this company as may be necessary, proper and convenient to fully complete and effect on the part of this company the purchase of the property, rights, privileges and franchises of the Lincoln Gas & Electric Company for the consideration and upon the terms and conditions set out in the minutes of said meeting of the stockholders.

235 Page 146 printed record.

EXHIBIT J.

Whereas, the Lincoln Gas & Electric Light Company has been incorporated for the purpose of engaging and with power to engage in the gas and electric business in the City of Lincoln, Nebraska, and vicinity, as will appear by the articles of Incorporation of said Company on file in the offices of the Secretary of State of Nebraska, and the County Clerk of Lancaster County, Nebraska, and

Whereas, in order to accomplish the purposes for which it has been incorporated it will be necessary for the Lincoln Gas & Electric Light Company to acquire Gas and Electric Plants and distributing systems and franchises for the operation of the same, and

Whereas, this Company is the owner of gas and electric plants and distributing systems in the City of Lincoln, together with the right and franchise to operate the same under an ordinance of the Mayor and Councilmen of the City of Lincoln, approved March 12th, 1872, as amended by an ordinance approved June 19th, 1900, and under various other ordinances all of which property, rights, privileges and other franchises are suitable for the business, to engage in which the Lincoln Gas & Electric Light Company was incorporated, and

Whereas, it has been ascertained that the Lincoln Gas & Electric Light Company will purchase from this Company, the property, rights, privileges, and franchises aforesaid for the consideration and upon the terms and conditions hereinafter set forth:

Now, Therefore, Resolved that this Company sell to the Lincoln Gas & Electric Light Company all this Company's property, rights, privileges and franchises of every name and nature, at and for a consideration equal to Two million, two hundred and forty nine thousand, one hundred dollars, ($2,249,100.), plus all this Company's existing just debts and liabilities, the said sum of Two million, two hundred and forty-nine thousand, one hundred dollars, ($2,-
249,100.) to be paid in full paid non-assessable Capital Stock
236 of the Lincoln Gas & Electric Light Company at par, and the balance of said consideration to be paid by the Lincoln Gas & Electric Company's assuming and agreeing to pay as and when they shall respectively mature, and becomde due all the existing, just debts, and liabilities of this Company, the transfer to be made as of December 1st, 1901.

Resolved, further that the Board of Directors of this Company and the proper officers of this Company be and they hereby are, fully authorized and empowered and directed to cause to be prepared and to execute, in the name of this Company, proper deeds and other conveyances of the property, rights, privileges and franchises aforesaid, and to deliver the same to the Lincoln Gas & Electric Light Company upon receipt of certificates for Two Million, two hundred and forty-nine thousand, one hundred dollars, ($2,-249,100.) at par of full-paid and non-assessable Capital Stock of the Lincoln Gas & Electric Light Company or upon receiving satisfactory assurance that such certificates will be issued and delivered

so soon as the same can be prepared, and generally to perform such acts and to execute such instruments on behalf and in the name of this Company as may be necessary, proper, or convenient to fully carry out and complete on the part of this Company the sale aforesaid.

It being expressly stipulated that as part of the consideration for the sale and conveyance of the property, rights, privileges, and franchises aforesaid, the Lincoln Gas & Electric Light Company shall assume and agree to become liable for any claim which one, J. C. Van Riper, may have against this Company, in case he shall hereafter succeed in establishing the same.

Resolved, further that the Board of Directors and proper officers of this Company be, and they hereby are, fully authorized and empowered and directed, upon receipt of certificates for the amount of Capital Stock of the Lincoln Gas & Electric Light Company aforesaid, to transfer and distribute the same to the Stockholders of this Company pro rata.

237 Resolved, further than when such distribution to the Stockholders shall have been made this Company be then and thereupon dissolved in accordance with Section 134, Chapter 16, Compiled Statutes of Nebraska, 1901, and that the Stockholders Present and voting at this meeting comprising more than two-thirds of all the members and stockholders of this Company, do hereby consent to such dissolution, and that the Board of Directors and proper officers of this Company be, and they hereby are, fully authorized and empowered and directed to perform all such acts and proceedings in the name and on behalf of this Company, and to execute all such instruments as may be necessary or proper to fully accomplish and effect such dissolution.

The question being upon the adoption of the foregoing Preamble and Resolutions, a ballot was had which resulted as follows:

Number of shares of stock voted in favor of the adoption of the Preambles and Resolutions 6749, Contra. None.

Thereupon the entire outstanding Capital Stock of the Company, excepting one share, has been voted in favor of the adoption of the foregoing Preambles and Resolutions, the Chairman declared that the same were fully adopted.

The following was introduced:

Referring to the action had at the Special Meeting of the Stockholders held this day respecting the sale and conveyance of all this Company's property, rights, privileges and franchises to the Lincoln Gas & Electric Light Company, and the dissolution of this Company, (Reference to the Minutes of said Special Meeting of the Stockholders being hereby made.)

Resolved, that the President and Assistant Secretary of this Company be, and they hereby are, authorized and directed to do and perform such acts, and to execute, acknowledge and deliver such deeds and conveyances in the name of, and in behalf of this Company as may be necessary, proper or convenient to fully complete

and carry into effect the sale and conveyance of this Com-
238 pany's property, rights, privileges and franchises to the Lincoln Gas & Electric Light Company, for the consideration and upon the terms and conditions set out in the said Resolutions of the Stockholders.

The question being upon the adoption of the foregoing Preamble and Resolution, the same were Unanimously adopted.

Gas Ordinance #22.

An Ordinance Defining Duties of Gas Companies, Fixing Maximum Rates for Gas Meters, Rules Regulating Supply, Use of, and Payment for Gas, Penalties for Violation Thereof, and Repealing All Ordinances in Conflict Therewith.

Section 1. Rates.—It will be unlawful for any one furnishing illuminating or fuel gas to charge customers more than one dollar ninety-two and one-half cents per thousand cubic feet for illuminating gas, or one dollar and fifty cents for gas used as fuel after October 1st, 1899. Annually thereafter gas used for lights shall be reduced seven and one half cents per thousand until October 1st, 1905, after which not more than one dollar and fifty cents shall be charged for gas used for either purpose. A meter rent of twenty five cents per month may be charged if less than three hundred feet per month are consumed, but not otherwise.

Section 2. Duty to Furnish.—Any person furnishing gas shall supply it to any property owner or occupant requesting service who has properly fitted his premises therefor, and paid or tendered the actual cost of extending service from point of location of meter to the curb line of any street wherein the supply man has gas mains. Service may be denied to consumers in default till payment for past service is made and to persons not responsible till deposit of sufficient sum to pay one and one-half month's estimated service is made to pay such service, and is from month to month kept good.

Section 3. Same.—Service may be denied if permission to inspect service or interior pipes or fixtures is refused, or if on inspection they are found defective. If service is denied for such alleged cause, the council may on the request of the person aggrieved, cause inspection by any competent person, the expense whereof shall be paid by the supply man refusing if the alleged defect does not exist.

254 Section 4. Discount.—Gas dues paid at the Company's office at or before six o'clock afternoon of the sixth day after any month's service, shall be allowed the customary ten per cent discount from the fixed or current rates.

Section 5. Penalty.—Any person or executive officer, president or manager of any corporation refusing to comply with this ordinance, or to furnish gas to any person entitled thereto, shall be guilty of a misdemeanor, and on conviction thereof be fined in any sum not less than ten dollars nor more than one hundred dollars, and each twenty-four hours' refusal shall be a new offense.

Section 6. Repeal.—An ordinance entitled: "An ordinance defining the duties of Gas Companies and prescribing the maximum rates to be charged and paid for gas and gas meters and the rules

regulating the supply and use of gas, prescribing penalties for violation of this ordinance and repealing section 928 A of the Revised Ordinances of the City of Lincoln and all Ordinances in conflict herewith," so far as in conflict with this ordinance, and all ordinances in conflict herewith, are hereby repealed, and this ordinance shall be in force from and after its approval and publication according to law.

Passed October 9th, 1899.

STATE OF NEBRASKA,
*Lancaster County, ss:*

I, Thos. H. Pratt, City Clerk, of the City of Lincoln, County and State aforesaid, do hereby certify that the foregoing is a true and correct copy of Ordinance No. 22, known as the Gas Ordinance, passed October 9, 1899, and approved October 14, 1899.

Witness my hand and Official seal this 6th day of May, 1908.

Gas Ordinance No. 363.

An ordinance establishing a unit of measure and a standard for manufactured gas, regulating the quality, purity, pressure, supply and use of gas; defining the duties of gas companies; creating the office of gas inspector and defining his duties; providing for a reduction in the price to be paid for gas not meeting the required standard established herein; establishing penalties for the violation of the provisions hereof, and repealing all ordinances in conflict herewith.

Be it ordained by the mayor and council of the City of Lincoln:

Section 1. Unit of Measure.—The unit of measure for the sale by meter of manufactured gas used for illuminating or heating purposes, shall be the cubit foot of sixty-two and 321-1000 pounds

avoirdupois weight of distilled rain water, weighed in air of the temperature of 62 degrees Fahrenheit scale, the barometer being at 30 inches.

Section 2. Standard.—All gas manufactured and sold in the City of Lincoln for illuminating or heating purposes shall be of the following standard: It shall have an illuminating power of not less than 18 English sperm candles when burned from a Suggs London argand burner No. 1, at the rate of five cubic feet per hour. It shall contain not less than 625 British thermal units per cubic foot, at a pressure of 14.7 pounds per square inch and a temperature of 60 degrees Fahrenheit scale. It shall have sufficient odor to be readily detected by its smell. It shall contain not to exceed 20 grains of sulphur per one hundred cubic feet. It shall have a pressure of not less than one and one-half inches nor more than five inches measured in a water gauge at the place where tested as herein provided.

Section 3. Testing Room.—The city council shall provide a suitable room in the city hall or elsewhere to be used as a testing
257 room by the gas inspector, and shall install and maintain therein all necessary apparatus, chemicals, supplies, books and records for testing and recording the pressure, quality, purity and illuminating and heating power of the gas supplied by any gas company to consumers in the City of Lincoln, and also all necessary apparatus, supplies, and records for testing, sealing and recording the accuracy of meters supplied and used by any gas company in said city. Said testing room shall be equipped with a Junker's calorimeter, or a calorimeter of standard make approved by the gas inspector; a bar photometer or a photometer of a construction approved by the gas inspector, a self registering pressure gauge and all necessary apparatus chemicals and supplies for making tests for the presence of sulphur, ammonia and sulphuretted hydrogen, and a machine of standard make approved by the gas inspector for testing meters, with necessary materials and apparatus for marking and numbering each meter tested with the result of the test and its date, together with all necessary books and records for recording the results of all tests and keeping a permanent record thereof.

Section 4. Gas Inspector.—The water commissioner is hereby made ex-officio gas inspector with authority to authorize the assistant superintendent of lighting plant, or any other competent person in his department, to act as assistant gas inspector.

Section 5. Duties of Gas Inspector.—It shall be the duty of the gas inspector to inspect, test and determine the pressure, quality, purity, heating and illuminating power of the gas manufactured and furnished to consumers for illuminating and heating purposes by any gas company in the City of Lincoln once each day and report in writing to the city council the result of said tests as to the pressure, quality, purity, heating and illuminating power. It shall be the duty of the gas inspector upon the written demand of any gas consumer and the payment of a fee of one dollar, together

273

with the location of the meter he desires to have tested to at once notify in writing the gas company owning said meter that
258 a complaint has been filed and the time when he will send after such meter, whereupon the gas company shall, in the presence of the gas inspector or assistant disconnect said meter, replacing it with another meter and deliver the old meter to the gas inspector to be tested by him, and if said meter shall be found to be correct, according to the standard hereinafter fixed, the one dollar paid by the gas consumer shall remain the property of the city. But if the meter is found to register more gas than consumed, within the standard hereinafter fixed, the fee of one dollar shall be paid by the gas company owning the meter and the gas inspector shall deliver to said gas consumer his certificate, showing that the meter has been found to register more gas than consumed and the fee of one dollar paid — said gas consumer shall be repaid to him by the city treasurer on the production and delivery of such certificate. It shall be the duty of the gas inspector to record in a suitable book provided for that purpose the number of meters inspected and sealed or condemned by him with the date and name of manufacturer and the results of such test, and he shall make a monthly report to the mayor and city council of the results of such tests.

Section 6. Meters.—Standard and Application.—All meters registering within two per cent slow or three per cent fast in every one hundred cubic feet of gas registered at a pressure of not less than one and one-half inches or more than five inches, measured in a water gauge, and when measuring the number of cubic feet per hour that the meter is designed to measure, shall be considered accurate. Inspection herein provided for shall be conclusive, both upon the gas company and the consumer, as to the amount of gas consumed during the three months previous to the month in which such meter shall be inspected.

Section 7. Monthly Reports.—It shall be the duty of the gas inspector to report in writing monthly to the mayor and city council the result of all tests of gas and meters made by him during said month, showing all moneys received by him, and to pay over to the city treasurer all money collected by him for testing meters and file his receipt therefor.

259 Section 8. Penalty for Violation of Standard. If the gas furnished by any gas company is found on any test to fail to meet the standard and requirements established by this ordinance, the gas inspector shall at once notify in writing the mayor and city council and such gas company, and shall make daily tests thereafter until the gas is found to comply with the standard and requirements herein established. And if the gas of any gas company is found for three consecutive days to fall below the standard and requirements established by this ordinance, such gas company shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be subject to a fine of one hundred dollars for each day that the gas furnished by it fails, upon inspection, to meet the standard and requirements herein established. Provided, the penalty provided for herein shall not be enforced when the failure to furnish gas according to the

standard and requirements herein established, is by reason of some unavoidable accident and was not caused through any negligence or fault of said gas company.

Section 9. Gas Below Standard Price. In case the gas furnished by any gas company to gas consumers within the City of Lincoln shall fall below the average of 625 British thermal units for the period of a month, beginning on the 20th of the month and ending on the 20th of the succeeding month, a reduction from the maximum amount allowed to be charged therefor by any gas company under the ordinances of the city shall be made to such gas consumers of five cents for each ten British thermal units which the average of such gas as hereinabove set forth shall show below 625 British thermal units.

Section 10. Application of Tests. The tests made by the gas inspector of the city for the purpose of determining the British thermal units shall be conclusive on all gas companies furnishing gas in the City of Lincoln for the purpose of determining the price to be paid for such gas by the gas consumers as hereinabove set forth.

260 It shall not be necessary for the gas inspector to make more than 15 tests for the purpose of determining the British thermal units on 15 separate days within any given month, and the average thereof shall be taken and deemed to be the average for the month for the purpose of determining the price to be paid therefor. If more than 15 tests are made the average shall be taken of all tests so made.

Section 11. Inspection of Books and Records. The books and records of all gas companies shall be subject to inspection by the officers of the City of Lincoln for the purpose of determining the amount charged and received for gas by any such company during any particular month.

Section 12. Violations of Ordinance. If any person shall counterfeit or wilfully deface the seal placed upon any gas meter by the gas inspector, the person or persons so offending shall be guilty of a misdemeanor and shall upon conviction thereof be fined not less than twenty-five ($25.00) or more than one hundred dollars ($100.00). Any gas company after receiving a written notice from the gas inspector, refusing to disconnect within twenty-four hours any meter of any consumer in the City of Lincoln and to deliver the same to the gas inspector to be tested shall be guilty of a misdemeanor and upon conviction thereof shall be fined in the sum of not less than ten dollars ($10.00) or more than one hundred dollars ($100.00).

Section 13. Application of Ordinance. The provisions of this ordinance shall apply to all companies which manufacture or distribute gas for sale for illuminating or heating purposes; and the term "gas company" shall include all persons, firms, corporations or individuals who own or operate works for the manufacture and sale of gas for illuminating or heating purposes.

Section 14. Repealing Clause. All ordinances and parts of ordinances in conflict herewith are hereby repealed.

This ordinance shall take effect and be in force from and after

its passage, approval and publication according to law. In-
261 troduced by John S. Bishop. Passed, April 9, 1906. Approved April 16, 1906.

Trade Notes.

Cast Iron Pipe.—Foundries report no large lettings in sight for the immediate future, and it is evident that municipal estimates are being cut to meet only imperative improvements. There is no

demand of consequence for gas pipe, although some plants are willing to buy on long terms of payment. Quotations: 4-inch, $27; 6 to 12-inch, $26; 16-inch and up, $25, with $1 extra for gas pipe. Frequent inquiries gives encouragement to manufacturers. Quotations: 4 to 6-inch, $23; 8 to 12-inch, $22; over 12 inch, $21, with $1 extra for gas pipe: On large contracts these prices have been steadied. San Francisco: Inquiries continue for small quantities all along the coast. Quotations: 6 to 12-inch, $38; 4-inch, $39.

Lead.—The market is firm, but dull. The American Smelting & Refining Company is selling at 4¢, New York, and independent interests are not competing, asking higher prices. The St. Louis market is also firm at 3.85¢. Considerable lead is in the market, bought at lower prices, but holders show no disposition to go after business.

New Pipe Foundry.—

Trade Notes.

Cast Iron Pipe.—Chicago; Business very quite. Quite a number of small municipal contracts are hinging on the disposal of bond issues. Competition has resulted in the reduction of $1 a ton. Quotations: 4-inch, $27; 6 to 12-inch, $26; 16-inch and up $25, with $1 extra for gas pipe. Birmingham: Proposed improvement in Manila, where 7,000 tons will be needed, and in Cuba where 18,400 tons will be taken, are encouraging to Southern producers. Prices low on large contracts, but firm for small orders. Quotations: 4 to 6-inch, $27; 8 to 12-inch, $25; over 12-inch, average $24, with $1 extra for gas pipe. New York: Prices advanced on account of stiffening in Southern iron. Quotations: car load lots, 6-inch, $24.50 to $25.

Lead.—Market firm with desilverized lead scarce and all grades held firm at 4¢, New York. St. Louis market firmer at 3.85¢. Inquiries have been made for good sized lots, and the demand continues to improve.

*Contract No. —.*

CHICAGO, Feb. 27, 1905.

Lincoln Gas & Elec. Lt. Co., Lincoln, Nebr., Bought of Pittsburgh Coal Company, Chicago, Ill.

Quantity.—About 8,000 tons, of 2,000 lbs. each, or all they may use at their plant at Lincoln, Nebr., during the life of this contract.

Grade.—¾" Screened, thin vein, Second Pool, Youghiogheny Gas Coal.

Price.—$5.20 per ton, F. O. B. cars their plant at Lincoln, Nebr.

Terms.—Cash on or before the 15th of each month for all coal shipped during the month previous.

Route.—Option of the Pittsburgh Coal Company.

Delivery.—Approximately monthly tonnage. About 650 tons per month as ordered by the Gas Company.

Expiration.—This contract expires April 1st, 1906.

Weights.—Actual Railroad weights by scales nearest loading point to govern all settlements.

This contract is one of a number of contracts made by the seller and is made subject to strikes, accidents, car supply or other causes beyond control.

The buyer and seller in entering into this contract realize the uncertainties of absolute deliveries, growing out of strikes, casualties, or other causes beyond the control of either party; and it is hereby mutually acknowledged that the intent of this agreement is not to bind either party as to failure to perform or modified performance by reason of matters beyond the control of the party in default, but that the material shall be shipped by the seller and accepted by the buyer as per delivery specified so far as the labor, the physical conditions at the respective plants, and the ability of carriers
270 will permit. It is mutually understood and agreed, however, that in the event of only partial fulfillment of this contract through restrictions of output from causes beyond control by seller, then the buyer shall accept without recourse such amount of coal as seller may be able under above conditions to supply from the seller's supply of available coal with other obligations.

The coal covered by this contract is to be used only in the plant

of the purchaser, located at Lincoln, Nebraska, and not to be sold or delivered to other purposes.

In consideration of the price named in this contract it is understood and agreed that the purchaser shall use no less than sixty tons each month, during the life of this contract.

This agreement is not effective until approved by home office and shall be subject to cancellation in case of violation of any of its terms or conditions.

*Contract No. —.*

CHICAGO, April 5, 1906.

Lincoln Gas & Elec. Lt. Co., Lincoln, Nebr., Bought of Pittsburgh Coal Company, Chicago, Ill.

Quantity.—About 15,000 tons of 2,000# each, or all they may use at their plant at Lincoln, Nebr., during the life of this contract.

Grade.—¾" Screened Thin vein Second Pool Youghiougheny gas coal.

Price.—$5.37½ per ton, F. O. B. their plant at Lincoln, Nebr. If during the life of this contract, the freight rate at $2.10 for the mines of Peoria is reduced, the Gas Co. shall receive the benefit of such reduction.

Terms.—Cash on or before the 15th of each month for all coal shipped during the month previous.

Route.—Option of the Pittsburgh Coal Co.

Delivery.—Approximate monthly tonnage. About 650 tons per month, as ordered by the Gas Co.

Expiration.—This contract expires April 1, 1907.

Weights.—Actual Railroad weights by scales nearest loading point to govern all settlements.

Deliveries of coal shall be subject to delays occasioned by strikes, lockouts, accidents and other unavoidable casualties in the operation of the seller's mines, the want of car supply, the failure of the railway companies to deliver or place cars at the mines for loading or other causes beyond the control of the seller.

It is understood between the parties hereto that the seller will be obliged to deliver coal to other buyers and consumers, and if by reason of the causes above mentioned, or either or any of them, such total obligations exceed the total shipments from the seller's mines, the seller may apportion among the buyer and other customers the coal it may be able to mine or ship for the time
272 being. And in event of partial fulfillment of this contract as aforesaid, the buyer without recourse, shall accept such amount of coal as the seller may be able to supply under such apportionment.

And it is further mutually covenanted and agreed that in the event of the buyer defaulting or failing to comply with the terms of this agreement and refuses to receive coal as specified herein, then this agreement may, at the option of the seller, be cancelled and ended; and for all coal delivered prior to such default, whether billed and paid for or not, the buyer shall pay, and hereby agrees to pay, the regular net circular price or prices in effect at the time of delivery.

The coal covered by this contract is to be used only in the plant of the purchaser, located at Lincoln, Nebraska, and not to be sold or delivered to other purposes.

This agreement is not effective until approved by home office and shall be subject to cancellation in case of violation of any of its terms or conditions.

Pittsburgh Coal Company of Illinois.

Railway Exchange.

*Contract No.* —.

CHICAGO, March 19, 1907.

Lincoln Gas & Electric Light Company, Lincoln, Nebr., Bought of Pittsburgh Coal Company, Chicago, Ill.

Quantity.—About 15,000 tons, or all they may use at their plant at Lincoln, Nebraska, during the life of this contract.

Grade.—¾" Screened Thin Vein Second Pool Youghiougheny Gas Coal.

Price.—$5.52 per ton of 2,000 lbs. each, f. o. b. cars, their works, Lincoln, Nebraska.

Terms.—Cash on or before the 15th of each month for all coal shipped during the month previous.

Route.—Option of Pittsburgh Coal Co.

Delivery.—Approximate monthly tonnage. 1,200 tons per month.

Expiration.—This contract expires April 1, 1908.

Weights.—Actual Railroad weights by scales nearest loading point to govern all settlements.

The above prices are based upon present freight rate per ton of 2,000 lbs.; should freight rate advance or decline these prices will advance or decline accordingly.

Deliveries of coal shall be subject to delays occasioned by strikes, lockouts, accidents and other unavoidable casualties in operation of seller's mines, the want of car supply, the failure of the railway companies to deliver or place cars at the mines for loading, or other causes beyond the control of the seller.

It is understood between the parties hereto that the seller will be obliged to deliver coal to other buyers and consumers, and if by reason of the causes above mentioned, either or any of them, such total obligations exceed the total shipments from the seller's mines the seller may apportion among the buyer and other customers the coal it may be able to mine or ship for the time being. And
274 in event of partial fulfillment of this contract as aforesaid, the buyer, without recourse, shall accept such an amount of coal as the seller may be able to supply under such apportionment.

And it is further mutually covenanted and agreed that in the

event the buyer defaults or fails to comply with the terms of this agreement, and refuses to receive coal as specified herein, then this agreement may, at the option of the seller, be cancelled and ended; and for all coal delivered prior to such default, whether billed and paid for or not, the buyer shall pay, and hereby agrees to pay, the regular net circular price or prices in effect at the time of delivery.

The coal covered by this contract is to be used only in the plant of the purchaser, located at Lincoln, Nebraska, and not to be sold or diverted to other purposes.

This agreement is not effective until approved by home office and shall be subject to cancellation in case of violation of any of its terms or conditions.

Agreement made this 6th day of April, A. D. 1905, between the Standard Oil Company (Indiana), party of the first part, and the Lincoln Gas & Electric Light Company, Lincoln, Nebraska, party of the second part.

Witnesseth: For valuable consideration it is agreed between the parties aforesaid, as follows:

The first party agrees to and does hereby sell to the second party, and the second party agrees to and does hereby purchase from the first party all the Gas Oil the second party shall use for the manufacture of Gas in its plant during the period of twelve (12) months from the above date, such supply estimated to be four hundred thousand (400,000) gallons, and it is hereby agreed shall not exceed four hundred fifty thousand (450,000) gallons, at and for the price of four and five one-hundredths (4.05) cents per gallon, in tank cars delivered at Lincoln, Nebraska, shipments to be made from Sugar Creek, Missouri.

The first party shall ship the aforesaid goods to Lincoln, Nebraska, as the business of the second party may require, and as they may in writing order, but not less than one tank car at any

one time, and as near as may be in equal quantities until the whole amount contracted for is delivered.

This agreement is understood to cover all the liquid Gas-making material that may be required for use in the plant of the party of the second part during the period embraced in this agreement.

The first party agrees that there shall be no unnecessary or unusual detention in the shipments of the goods herein mentioned, but they shall not be held responsible for accidents or unavoidable delays in delivery of same.

276 There shall be no delay in unloading cars. If cars are detained at destination over 48 hours (Sundays and Legal Holidays excepted) for the first day's detention thereafter there will be a charge of one dollar $1.00; for the second day, $2.00; for the third and each succeeding day, $3.00.

Terms.—Net cash thirty (30) days after date of shipment, payments to be made in New York or Chicago Exchange.

In witness whereof the said parties have executed this agreement in duplicate the day and date first written herein.

Agreement Made This 21st Day of March, A. D. 1906, Between the Standard Oil Company (Indiana) Party of the First Part, and the Lincoln Gas & Electric Light Company, Lincoln, Nebraska, Party of the Second Part.

Witnesseth: For valuable considerations it is agreed between the parties aforesaid, as follows:

The first party agrees to and does hereby sell to the second party, and the second party agrees to and does hereby purchase from the first party all the Gas Oil the second party shall use for the manufacture of gas in its plant during the period of twelve months from April 6, 1906, such supply estimated to be four hundred fifty thousand (450,000) gallons, and it is hereby agreed shall not exceed five hundred thousand (500,000) gallons, at and for the price of four and one-tenth (4 1/10) cents per gallon, in tank cars delivered at Lincoln, Nebraska, shipments to be made from Sugar Creek, Missouri.

The first party shall ship the aforesaid goods to Lincoln, Nebraska as the business of the second party may require, and as they may in writing order, but not less than one tank car at any one time, and as near as may be in equal quantities until the whole amount contracted for is delivered. This agreement is understood to cover all the liquid Gas making material that may be required for use in the plant of the party of the second part during the period embraced in this agreement.

The first party agrees that there shall be no unnecessary or unusual detention in the shipment of the goods herein mentioned but they shall not be held responsible for accidents or unavoidable delays in the delivery of same.

There shall be no delays in unloading cars. If cars are detained at destination over 48 hours (Sundays and Legal Holidays excepted) for the first day's detention thereafter there will be a charge of One Dollar; for the second day, two dollars; for the third and each succeeding day, Three Dollars.

278 Terms: Net cash thirty (30) days after date of shipment, payments to be made in New York or Chicago Exchange.

In witness whereof the said parties have executed this agreement in duplicate the day and date first written herein.

Gas Oil (27-34 Degrees).

Agreement Made This 15th Day of April, A. D. 1907, Between the Standard Oil Company of Nebraska, a Corporation Organized under the Laws of the State of Nebraska, Party of the First Part, and the Lincoln Gas & Electric Light Company, of Lincoln, Nebraska, Party of the Second Part, Witnesseth:

In consideration of the mutuality hereof, it is hereby agreed between the parties hereto as follows:

1. The party of the first part sells and agrees to deliver to the party of the second part the number of gallons of Gas Oil (27-34 degrees) the second party shall use in the manufacture of gas in its plant during the contract period beginning April 15, 1907, and ending April 15, 1908; such supply estimated to be 500,000 to 600,000 gallons.

The party of the second part agrees to receive the gas oil defined in Section 1 at and for the price of four and 20/100 (.0420) cents

per gallon delivered in tank cars at Lincoln, Nebraska; such deliveries to be made as the business of the second party may require and as they in writing order but not less than one tank car at any one time.

This agreement is understood to cover the liquid gas making material that will be required for use in the plant of the said party of the second part during the period embraced in this agreement.

The party of the first part agrees that there will be no unusual or unnecessary detention in the shipment of the oil herein mentioned, but said party shall not be held responsible for accidents or unavoidable delays in the delivery of same.

It is agreed that the party of the second part is to make all necessary arrangements for the prompt unloading and return of cars upon arrival at their works, and in all instances to use their utmost endeavors to prevent delay.

280 It is agreed between the parties hereto that payments shall be made in cash, monthly, on invoices of the preceding month; payments to be made in Omaha Exchange.

In witness whereof the parties hereto have executed this agreement the day and date first written hereunder.

STANDARD OIL COMPANY,
NEBRASKA,

Sixth Floor, Keith & Perry Bldg.

E. R. Dusky, Gen'l Sales Mgr.
General Offices: Kanses City, Mo.

KANSAS CITY, Mo., Feb'y 1st, 1904.

Lincoln Gas & Electric Light Co., Lincoln, Nebraska.

GENTLEMEN: We hereby agree to furnish you with what coal you may require for one year from the date of this letter at the following price per ton of two thousand pounds f. o. b. mines: Cherokee or Fidelity Deep Shaft Shaker Screened Gas Lump $2.25.

The coal to be furnished to be known as Cherokee or Fidelity. Railroad or mine weights in all cases to govern settlements. Payments to be made on or before the tenth day of each month for all coal shipped during the preceding month. You to take your supply of Kansas coal from us, and we are to fill your orders promptly at all times, except in cases of strikes of mine or railway employes, break-downs at mines, contingencies of transportation and other unavoidable delays.

It is further mutually agreed and understood that should there be any advance or reduction in the cost of mining during the life of this contract, the above price shall be accordingly reduced or advanced.

The acceptance of this proposition in writing is to be considered a contract and binding on both parties.

Yours truly,

(Signed) E. R. DUSKY,
*General Sales Manager.*

Accepted:

472. In the Circuit Court of the United States for the District of Nebraska, Lincoln Division.

THE LINCOLN GAS & ELECTRIC LIGHT COMPANY, Complainant,

vs.

THE CITY OF LINCOLN, NEBRASKA; FRANCIS W. BROWN, Mayor, et al., Defendants.

UNITED STATES OF AMERICA,
*District of Nebraska,*
*Lincoln Division, ss:*

I, Myron E. Wheeler, Examiner, hereby certify that the foregoing testimony in the above entitled case was taken before me, at the times and places in the record thereof indicated; that before testifying, each of the several witnesses was by me severally and duly sworn to tell the truth, the whole truth, and nothing but the truth; that said testimony was taken in short-hand, and by me transcribed, and by consent of parties the signatures of the respective parties to their extended depositions, was waived.

MYRON E. WHEELER,
*United States Examiner.*

359 HENRY I. LEA, being first duly sworn, testified on behalf of the plaintiff as follows: Page- 20 to 513, Volume 1, Original Record.

Direct examination by Mr. Strode:

I live in Chicago. I am a consulting gas engineer, and have been since the Spring of 1907. I have been in the gas engineering business continually since 1896. My first experience was with the Gas Company at Madison, Wisconsin. The first year my duties were of a clerical nature. The second year I was works foreman, and the next year I was works superintendent. I was next at Peoria, Illinois. I was superintendent of construction of a new plant. I went there in the latter part of 1899, and built a new plant and was turning out gas the following spring. Before we could start construction we had to tear down a whisky distillery. I was in charge of that work until all of the new work was installed, and the plant was actually making gas. I did not put in the distribution system. I next went to Fon Du Lac, Wisconsin. I was superintendent and manager of the company there. The capacity of that plant was 100,000 to 150,000 cubic feet a day. After four or five months there I next went to Ottumwa, Iowa to extend a distribution system and to do some remodeling. While there I also had charge of some minor alterations at Keokuk, Iowa. I was next sent to Evanston, Illinois, by the same people as superintendent of distribution the first year. The second year I was general superintendent and the third year I was made manager and remained manager until a change of ownership. The capacity of the Evanston property was 650,000 cubic feet per day. I next went to the Division Street Station of Chicago, one of the plants owned by the People's Gas, Light & Coke Company. Their capacity was between 9,000,000 and 10,000,000 feet per day. It was all water gas. At Evanston the plant was coal and water gas. After leaving Chicago I have been connected with producing gas compan-*ys* until I opened my office in Chicago in 1907. I went to

360 Fort Wayne, Indiana, as Assistant to the President and Chief Engineer of the Western Gas & Construction Company, which was devoted exclusively to building gas works apparatus for coal and water gas and coke oven gas plants. There they had shops employing about 450 men for this work. I remained there about two years and then went to Pittsburg for George Westinghouse. I was placed in charge of an experimental gas house which had been in use for seven years, put up for the purpose of developing gas producers to be used in the place of steam engines. This plant had not reached any successful commercial stage, and I was placed in charge of the work. I had to build my own organization, and had no limit on men, methods or money. While there I brought out three types of producers that are now being sold by the Westinghouse Machine

Company. When I left Pittsburg, we had eleven producers gas plants of my design in successful operation outside of Pittsburg. After leaving these people, I opened my office as Consulting Engineer in Chicago.

I have made valuations for banks, bond houses, Gas Compan-*ys* and individuals of properties having reproduction cost today of more than $110,000,000. My work has been in something over seventy different cities. I have also made other examinations for companies who were having operating difficulties. The difficulties in their plants, and I have made examination of properties to determine whether changes in method of equipment would be advisable. I have designed equipment for manufacture of gas apparatus. I have designed gas plants and have constructed them. I am constructing one now. I have prepared designs for plants which are not in course of construction this year. This work has not only covered manufacturing plants but the distribution system as well, in a number of cases. My work also has covered oil gas, coal gas, water gas, coke ovens and I have done considerable work in connection with natural gas properties. I have been employed here in connection with the property of the Lincoln Gas Company. I first came here February 18th for the purpose of determining what property was here in the service of the public and arriving at its valuation. I first made a general inspection of the gas plant while I was here and outlined with Mr. Broadnax the general scheme for the preparation of a detailed inventory of all the physical equipment of the Company. In making the detailed inventory I had them go over
361 the plans specifically, taking each building and measuring it and determining the materials from which it was made and had them arrive at the actual quantity of brick, concrete and lumber in each building. The plan was to determine the kind, size and number of the various types of gas equipment. The plan was to determine the number of feet of each kind and size of pipe used for street mains, together with the nature of the soil and kind of pavement, if any, over each main. The total number of house services was ascertained, their average length, size and the number of service, and under which kind of pavement. The number of stub services, their average leng*h*th and diameter and whether or not under pavement. The number, size and kind of pressure regulators, and all service boxes, stop cocks, valves and drip pots, railway and steam railroad crossings. The number, size and kinds of meters both in use and in stock. In fact the plan was to make as complete a list as possible of all the items of physical equipment. This data was assembled from the property itself. This work was done by Mr. Broadnax and the men working under him from the general plan that he and I agreed upon when I was here.

The data furnished by Mr. Broadnax was in considerable detail, for instance each building submitted was described and the quantities of brick work, concrete and footings, if any, the number of feet of lumber or other material that entered into the building was all given in great detail. These quantities were worked out in this way on each building. The equipment and foundation were all minutely

described and by me identified. The distribution system was handled the same way. I also made an investigation of the gross receipts, operating expenses and net receipts from the records of the Gas Company for the past ten years and have examined carefully all of the details of income and operating expenses. Mr. Broadnax furnished the details of the property and I placed the value upon it. In determining the value and extent of the property I make a practice of dividing the property in four groups. These four groups are real estate, buildings, works equipment and distribution system. These four groups will cover all of the physical equipment except that which goes into working capital. We have prepared a report showing the valuation of all the physical properties of this company, including the valuation of the real estate but I did not prepare
362 the value of the real estate myself. I have no knowledge of local real estate value, and I have not submitted what I think local real estate is worth, except that I have made inquiries and have put in the valuation at what I think it is worth, and have put in figures subject to correction. In the valuation of the buildings I applied to the units of quantity, such prices as I found through local inquiry and experience in surrounding cities to be fair.

In view of the question here, which is from my standpoint, a reproduction of a new plant, I have taken into consideration what you would have to pay for material of a given kind throughout the period of construction for reproducing this property. As to valuation on works equipment there is no concern in Lincoln manufacturing it, and my views are governed by the sale price of buying or manufacturing the equipment around the country. My figures are based on the present day valuation with a reasonable period required for construction. In valuing the distribution system we can get closer to the local prices for a guide as there is pipe sold in Lincoln. As to the element of labor, I have inquired into local labor conditions and have given my estimates accordingly. I have first determined what I call the net construction cost, which is the cost of the contractor to the company, for instance if he sells you a wagon for $100, then $100 is the net construction cost of that wagon. I have next determined the reproduction cost. That is the net construction cost, plus the overhead charges incident to the construction. The items of engineering, supervision, loss of interest during construction, taxes during construction, casualty, liability, ommissions and contingencies all come between the net construction and the total reproduction cost. I next arrived at the present value of the property. The present value is always less than the reproduction cost. The present value takes into account the depreciation which should be taken from the reproduction cost. I have determined the amount of going value that is to be added to the physical properties on account of their being a going concern. I have also determined the amount of depreciation in detail. I have also prepared and have here in this report a list of the real estate. It is found under Exhibit G. In one instance there is a small cottage included with the real estate as a part of its value but this list does not include any improve-
363 ments such as the gas plant itself or other buildings. The overhead as I use it is not added to the real estate net con-

struction cost, but a fair and reasonable present value of the real estate is $21,700. This is shown in Subdivision "G", identified here as Exhibit "7-*a*." The net construction cost of the buildings is in my report in the pages following Exhibit "H" extending to Exhibit "I". It is identified as Exhibit "7-*b*." Exhibit "7-*b*" and the pages following to the parts marked "I" gives the net construction cost of all of the buildings of the gas department of the company. It gives the dimensions and the details of the cost of materials, labor and excavation, showing the kind of material and everything pertaining to the construction of the buildings. The total construction cost of the purifying house is $16,620.00, Exhibit "7-*b*2"; of the generator house, $3,739.00, Exhibit "7-*b*3"; Retort, $7,689.00, Exhibit "7-*b*4": The meter shop and booster house, $2,616.00, Exhibit "7-*b*5"; Coal shed $1,793 Exhibit "7-*b*6"; Oil tank house $1,558.00 Exhibit "7-*b*7"; Oxide shed $60.00, Exhibit "7-*b*8"; Stable and blacksmith shop $818, Exhibit "7-*b*9"; booster house at district holder $721.00, Exhibit "7-*b*10". The booster house is the building housing machinery there at the gas holder for reinforcing the pressure. It is a pressure booster. The total net construction cost of all of the buildings is $35,614.00, Exhibit "7-*b*11."

I have also made a valuation of what I term the works equipment of the property. Under that head I have included all of the machinery and appliance at the gas plant used and useful in the manufacture of gas and the office furniture and fixtures and the small tools, works tools, as they are called, in the plant. I have not included under this head the tools of the distribution department. They are found under that department. The details of the works equipment valuation is found in plaintiff's Exhibit "7-I". This shows all of the items which makes up the works equipment. I have given the net construction cost of these items by grouping together such items as go to make up a piece of the equipment, for instance a water gas set is made up of several different shells. They all go to make up the one set, and I have given the cost of that set as a whole, without giving the cost of the different parts of it. Their value is determined by sets. I have shown what each piece of equipment is made up of in detail, but have given the value of the thing as a whole. This includes the cost of installation and excavating,
364 and is the net construction cost as follows: One 7′ 6″ water gas set in place and ready to use, $8,477.00, Exhibit "7-I-12"; Another set, a duplicate of the first one, $8,477.00, Exhibit "7-I-3"; One water gas condenser and scrubber, $1,219.00, Exhibit "7-I-4"; One operating floor and water gas floor, $2,052.00, Exhibit "7-I-5"; One 6′ 6″ water gas set, built by the Western Gas and Construction Company $8,072.00, Exhibit "7-I-6"; One 6′ 6″ gas set of the Springer type, $4,991.00, Exhibit "7-I-7;" Operating floor, $1,871, Exhibit "7-I-8"; One No. 7 Belted Sturdevant blower on foundation $272.00, Exhibit "7-I-9"; One No. 7 Sturdevant blower, belted on foundation $279.00. Exhibit "7-I-10"; One No. 1 Root's positive blower on foundation $273.00, Exhibit "7-1-11"; One No. 8 Sturdevant Turbo Blower, Type C-3, $1,435.00, Exhibit "7-I-12; One No. 8 Sturdevant blower belted on foundation, $453.00, Exhibit "7-I-13";

One No. 6 Root's Exhauster, $791.00, Exhibit "7-I-14"; One No. 6 fan type Sturdevant belted exhauster $346.00, Exhibit "7-I-15"; One 10" McKenzie exhauster, $440,00, Exhibit "7-I-16"; One 4" by 5" Greenfield vertical steam engine, $240.00, Exhibit "7-I-17"; One 5" by 5" Sturdevant vertical high speed automatic engine, $270.00, Exhibit "7-I-18"; One 7" by 6' Sturdevant high speed automatic steam engine with foundation, $367.00, Exhibit "7-I-19;" There is one 40 H. P. General Electric Company direct current motor, $655.00, Exhibit "7-I-20"; One 35 H. P. Fort Wayne, D. C. Motor Compound wound type, $566.00, Exhibit "7-I-21"; Four 15" cast iron table hangers, $77.00, Exhibit "7-I-22." Six benches of 6's ¾ depth, $17,993.00, Exhibit "7-I-23"; Charging floor containing 1418" cast iron framing and 9149 steel framing, and 1284 Sq. ft. of ½ inch cast iron plates, $2,440.00, Exhibit "7-I-24"; Coal gas condenser 4' 6" diameter by 25' high, $761.00, Exhibit "7-I-25". Coal gas scrubber 5' 6" by 31' high $411., Exhibit "7-I-26"; one 4' 6" by 5" Smith & Sayre Rotary Scrubber, $2,121.00, Exhibit "7-I-27"; Four purifying boxes 20' by 24' be 4' $13,088.00, Exhibit "7-I-28"; one 10' McDonald Station meter with Hindman drum, $3,901.00, Exhibit "7-I-29"; One 6' American Station meter with Parkinson drum, $1,358.00, Exhibit "7-I-30"; One 500,000 Cu. ft. 3 lift Gas holder in steel tank, $43,985.00, Exhibit "7-I-31"; One
365 200,000 Cu. ft. 2 lift gas holder in brick tank, $25,119.00, Exhibit "7-I-32"; One 50,000 cu. ft. single lift gas holder in brick tank, $10,409.00, Exhibit "7-I-33;" One 20" Conoway automatic governor, $840.00, Exhibit "7-I-34"; One 12" Reynolds station governor, $415.00, Exhibit "7-I-35"; One 6" by 10" by 5" by 10" Knowles compound pump, $360.00, Exhibit "7-I-36"; one 3" by 4" vertical plunger pump $160.00, Exhibit "7-I-37"; One 3½" by 4" by 6" Gardner Duplex Pump, $90.00, Exhibit "7-I-38"; One 4½" by 2¾" by 4" Gardner Duplex Pump, $95.00, Exhibit "7-I-39"; One 4½" by 3¾" by 4" Worthington Duplex pump, $100.00, Exhibit "7-I-40"; One 4½" by 2¾" by 4" Worthington Duplex pump, $95.00, Exhibit "7-I-41"; One 3" by 2" by 3" Worthington Duplex pump, $85.00, Exhibit "7-I-42"; One 6" by 4" by 6" Warren Simplex pump $160.00, Exhibit "7-I-43"; There is one [illegible] by 3" by 4" in Marsh Simplex pump, $80.00, Exhibit "7-I-44"; Otis Elevator Electrically operated, $1,060.00, Exhibit "7-I-45"; One Fairbanks Platform Scales, $60.00, Exhibit "7-I-46"; One 60" American Bar Photometer, $450.00; Exhibit "7-I-47"; One Younger's Calorimeter complete with meter in duplicate, $210.00, Exhibit "7-I-48".

Under the heading "Shop tools and Miscellaneous" I show items having a net construction cost of $462.00, Exhibit "7-I-49"; Four steel boiler shells 63" in diameter, $760.00, Exhibit "7-I-50;" One tar separator 5' by 17' by 10' $179.00, Exhibit "7-I-51"; One 3' 3" by 3' 10' tar wall, $104.00, "7-I-52"; One 6' by 20' by 12' tar wall; $472.00, Exhibit "7-I-53"; Two steel tar tanks $1,587.00, Exhibit "7-I-54"; Two additional steel oil tanks, $1,855.00, Exhibit "7-I-55"; Two oil tanks 8' by 24' $1,220.00, Exhibit "7-I-56"; One oil tank 10 ft. by 10 ft. $228.00, Exhibit "7-1-57"; One 100,000 cu.

ft. single lift gas holder $18,675.00, Exhibit "7-1-58"; Water piping at works above ground and water piping below the ground at the manufacturing plant $732.00 Exhibit "7-I-59": The water piping plus the valves on that piping make a total of $821.00; Drain piping at the works, $1,583.00, Exhibit "7-I-60"; Oil piping at the works above and below ground and valves, $443.00, Exhibit "7-I-61"; Gas piping at the works above and below ground, $6,750.00, Exhibit "7-I-62"; Steam piping at the works above ground covered and above ground uncovered, and valves, $2,657.00, Exhibit "7-I-63";

366 Tar piping at the works above and below ground, $586.00, Exhibit "7-I-64". The miscellaneous small tools used around the works have a net construction cost of $600.00, Exhibit "7-I-65". I have an itemized list of all of these tools, but I did not have time to copy them into this Exhibit. The items, office furniture and fixtures consist of 4½ pages which is shown in Exhibit "7-I-66"; their net construction cost is $13,039.00, two-thirds of which I have charged to the gas department, which is $8,606.00. Water pipe and valves at the district gas holder are shown in Exhibit "7-I-67"; their net construction cost is $177.00. The gas pipe above and below ground at the district holder station is shown in Exhibit "7-I-68"; their net construction cost is $463.00; Four manholes at the district holder station, net construction cost $1,533.00 Exhibit "7-I-69"; One, 25 H. P. General Electric motor of the induction type, net construction cost, $423.00, Exhibit "7-1-70"; 1, 5 H. P. General Electric Company induction type 3 phased 220 volt, 1200 R. P. M. Motor having a net construction of $160.00, Exhibit "7-I-71"; 1 No. 5 belted Sturdevant blower on foundation, having net construction cost of $180.00, Exhibit "7-I-72"; One No. 5 Sturdevant blower positive blower geared, having a net construction cost of $210.00, Exhibit "7-1-73"; The total net construction of the works equipment I have enumerated, shown in detail in these Exhibits above specified is $218,358.00.

367 The net construction cost of the distribution system as given by me will be found under Exhibit J of Exhibit 7. In it is shown a tabulation of all of the street mains, of all of the drip pots, then of the valves, then of the district governors, and a listing of the number of the railroad crossings, and of the distribution tools and minor items with the tools, and the listing of the gas appliances alone, and then a tabulation of all of the house services and then of the stub services. Then are given the number of the service governors and of service boxes and stop cocks and of meters, all of which comprize the distribution system of the property. In determining the net construction cost of the distribution system I have followed the same general plan that I used in determining the net construction cost of the works equipment except that in determining the cost of laying the pipe I placed more dependence upon information obtained locally than in dealing with the works equipment which is not handled locally. A statement was furnished me by Mr. Brodnax of the number of feet and miles and the size of mains and the showing of this is in my report.

Exhibit J-2 is a map of the city of Lincoln with the distribution

system as to mains, indicated by red and green colors, the red denoting the cast iron and the green denoting the wrought iron pipe. On this map there is no attempt made to indicate the various sizes of the mains. The sole purpose being to indicate in a general way how the city is piped. Exhibit J-3 shows the extent and character of the street paving over the mains. There is a key in the lower right-hand corner that gives the meaning of the different colors better than I can state it. Each color indicates a kind of paving. This does not indicate the size or extent of mains under this paving. It simply shows the location. The total net construction cost of the 1¼ inch, 2258 ft., under paved and unpaved streets is $1,334. There are 359,601 ft. of 2-inch wrought iron pipe and the total net construction cost of that is $138,762. These are all in Lincoln. There are also
368 in Lincoln 406 ft. of 3-inch cast iron pipe having a total net construction cost of $386. There is a total of 94274 ft. of 4-inch cast iron pipe in Lincoln under paved and unpaved streets having a total net construction cost of $89,140. There are a total of 25,873 ft. of 6-inch cast iron pipe in Lincoln having a total net construction cost of $31,825. There are a total of 4568 ft. of 8-inch cast iron pipe in Lincoln having a total net construction cost of $6,977. There are a total of 9810 ft. of 10-inch cast iron pipe having a total net construction cost of $15,508. There are a total of 3613 ft. of 12-inch cast iron pipe in Lincoln having a total net construction cost of $7,458. There are a total of 1269 ft. of 16-inch cast iron pipe in Lincoln having a total net construction cost of $3,827. There are a total of 1472 ft. of 20-inch cast iron pipe in Lincoln having a total net construction cost of $4,978. The total length of gas mains in Lincoln is 503,144 ft. and the total net construction cost is $300,195. This does not include such items as street mains miscellaneous, such as drips and valves.

The number of feet of mains and their size and the net construction cost outside of Lincoln is given separately but they are taken into account when I give the whole value of the property shown on the first sheet of part J of my report. Outside of Lincoln there are 62640 ft. of 2-inch and 4-inch mains having a total net construction cost of $22,066, which brings the total distribution system up to 565784 ft. with a total net construction cost of $322,261. The letters WI and CI at the top of the second column in this subdivision of my report indicates the kind of pipe, whether cast iron or wrought iron. The first column indicates the size of the pipe, the third indicates the length in feet, and the next column, the kind of pavement. The next two columns are a division of the extra cost on account of pavement. The first column, net construction cost of pipe laid in unpaved streets, indicates the cost of laying the piece of mains specified in a street having no pavement, and the next column gives the cost
369 of tearing up the pavement and replacing it over that particular piece of main. Where there is no pavement over a given piece of main there is no addition made in that last column and in that case the total net construction cost is the same as the net construction cost of the pipe laid in the unpaved streets. Immediately following the sheets showing the mains is a sheet marked Exhibit

J-5, showing the number, sizes, kinds and net construction cost of the street main drips in Lincoln. A street main drip is a cast iron pot or pipe or a wrought iron pipe laid alongside of the main and connected with the main by a small pipe tapped into it at the bottom so that the condensation collecting in the main at a low point will run out of the main into the drip pot. From this drip pipe or pot it is removed by a pump. The drip is so arranged that the gas cannot escape even when the drip is opened. The water forms a seal which retains the gas and allows the water to be pumped out to a certain point. These are scattered all over the system wherever there is a low point which would otherwise become a trap. There are a total of 181 street main drips of different sizes in Lincoln and the total net construction cost is $1,113. In addition there are a total in Lincoln of 22 valves and their total net construction cost is $328. There is also one 4-inch district governor having a total net construction cost of $225.

The fact that a railway crosses a gas main increases the cost of reproducing the main. The item in my report entitled Railway Crossings does not at all refer to the cost of building the railway. It refers solely to the additional cost which is necessarily met in reproducing a main crossed by a railway. It has not been included in the total cost of the mains heretofore given. There are in Lincoln a total of 349 railroad crossings and the total net construction cost represented by them is $6,220. This item is here regardless of whether the railroad was built before or after the main was put in. Outside of Lincoln there are 19 railroad crossings over existing gas mains and their total net construction cost is $290. The total number inside and outside of Lincoln is 368 with the net construction cost of
370 $6,510. These miscellaneous items, being street main drips, and the main valves, district governor, and railroad crossings, are all shown on Exhibit J-5 in detail. Those that are given as being outside of Lincoln are the only ones that are not required in Lincoln. Those in use in Lincoln were there and required to be there before the mains were built outside. The same is true with the tools. The items listed on Exhibit J-6, consisting of two or three pages, consist of small tools and appliances required by the workmen in the distribution department. An actual detailed inventory of these tools was made and furnished to me by Mr. Brodnax. The net construction cost of these tools shown on Exhibit J-6 is shown in a column in that report but I have omitted the heading of net construction cost. I have the figures there representing that cost. The total net construction cost is $6,210.

In addition to this there is another group of items classed with the street mains miscellaneous, which is composed of the gas appliances loaned by the company and in use. It is customary to do this by gas companies and it is good business from the standpoint of the consumer as well as the company. They consist of gas arcs, pot plates, second-hand gas ranges, water heaters, broilers, and burners, in all having a net construction cost of $3,791. The total net construction cost of the street mains miscellaneous composed of drips, valves, district governor, railroad crossings, tools, and gas appliances loaned is $18,177.

The next subdivision of the distribution system is the services. In this subdivision I have included house services as well as stub services inside as well as outside of Lincoln. It is shown in Exhibit J-8. A house service is the pipe which extends from the gas main to the meter in the house. A stub service is a service which the company lays from the main to just inside of the curb line. This is done when it is notified by the city that certain pavement is to be laid and in order to provide for its business and to avoid tearing up the pavement later the stub service is laid to just inside the curb line
371 before the pavement and before it is needed. The service is capped and left until at some future date it is extended into a house when it becomes a house service. The average length of house services in Lincoln is 73 ft., determined from an examination of something over 2000 separate records. There are a total of 8201 house services in Lincoln under paved and unpaved streets having a total net construction cost of $125,250. The stub services average 23 ft. in length and 1¼-inch in diameter. There are a total in Lincoln of 114 stub services having a total net construction cost of $1,006. Outside of Lincoln there are no stub services but there are 338 house services outside having a total net construction cost of $4,583. The total number of house and stub services inside and outside of Lincoln is 8653, and the total net construction cost is $130,839. This is all shown in detail in the exhibit.

The column in this exhibit headed Net Construction Cost of pipe laid under unpaved streets and *and* net construction cost of tearing up and replacing pipe means the same as it did in respect to street mains. Exhibit J-9 is a statement of the service governors. It shows the number, size, and net construction cost. A service governor is a device placed on each service pipe for the control of the gas pressure in that service. The total number of service governors in use in Lincoln is 7000, with net construction cost of $19,340. 34-144 inch governors (P. 91-92) having net construction cost of $96,000; and ½ inch service governor having cost of $600. Total number in Lincoln is 319 with net construction cost of $562.00. Outside Lincoln there are at State Farm 3-¾ inch governors at cost of $8.00, one two inch having cost $8.00. At University Place there are 149-¾ in. services at cost of $4.05. In Havelock there are 17-¾ inch at cost of $46.00. Total number outside are 170 at cost of $467.00. Total number in use inside and outside of Lincoln, 7,170, at cost of $19,807.00. The total number of service governors in use and in stock in Lincoln and outside of Lincoln on this system on January 1913 was 7489, with a total net construction cost of $20,369.

The next subdivision marked Exhibit J-10 shows the service boxes and cocks. On each service pipe just inside of the curb line it is customary to place a stop cock and over this stop cock leading from the pipe to the surface of the ground is placed a cast iron stop box or service box, which has an adjustible cast iron top, and in case of fire or other emergency you can go to this box, open the top by a wrench, and shut off the gas. Exhibit J-10 shows the number of such boxes and cocks and their net construction cost. In Lincoln there are 6149 service boxes and cocks having a net construction cost of $11,068.

J-11 is the subdivision of the distribution system showing the
372 number, size, and net construction cost of the meters of the distribution system in Lincoln. The total number in use in Lincoln is 8068, with a net construction cost of $61,552. There are less meters than there are services for the reason that some of the services are temporarily out of use and when this occurs the meters are taken out. There are also less service boxes and cocks than services as all of the services do not have boxes. In addition to the meters in use there are 243 meters in stock with a total net construction cost of $1,892, and in addition to these there are the meters in use and in stock outside of Lincoln shown on the following page. The total number of meters in use and in stock in Lincoln and outside of Lincoln is 8816, and their net construction cost is $66,017. Total meters outside of Lincoln is 305 with net construction cots of $2,573.00. (p. 96). The total net construction cost for the distribution system is shown in my report on the first page following the letter J, and is $568,731.

Exhibit F, marked Exhibit 7-B shows the net construction totals of the four divisions of this property; real estate, buildings, works equipment, and distribution system. The total net construction cost of these four divisions is $844,403. The item of working capital does not enter into this total.

Exhibit 7-C is headed Engineering, etc. This indicates the percentages which combined have been added to all of the net construction costs of physical equipment just gone over, except the items of real estate and working capital. The basis for the item, Engineering and Supervision, 6%, is the current price among engineers and business men generally for the preparation of plans and specifications, the taking of competitive bids and placing the contracts, and over-seeing the construction and paying on the fulfillment of contracts. It is entirely in addition to any expenses which the contractors incur and it is largely preliminary and partly co-incidental with operation of the contract. If I were to replace this property or
build one like it, after having made a preliminary examina-
373 tion to determine its feasibility, it would then be necessary to work out the details and to do that I would have to have money to make a survey of the ground available for the plant as well as the town in order to determine the distribution system. I would have to make detailed drawings of all the buildings, a very large part of the works equipment, and make detailed drawings of the distribution system, and would have to make a lot of calculations as to various kinds of pipe and pressure to use, and it is all work that requires considerable time, practice, ability, and skill. After having prepared detailed plans and specifications I would have to submit those plans and specifications to a number of contractors whom I would consider competent to handle that class of work. The distribution system I would not submit to a contractor, but the buildings and the works equipment I would submit to contractors who make a specialty of that kind of work. They would submit their bids to me with their specifications and proposals. I would then go over all of these propositions and their detailed specifications and tabulate their

propositions and parallel them to determine which is the proposition that should be accepted on a given point. I would then advise my client that such and such a contract should be entered into, and the contract would be made any my representative or myself would go to the site of the work or to the shop of the builders of equipment as often and for as long as might be necessary to see that everything was being done in full accord with the specifications, and then I would oversee the construction of the plant and would pass upon the fulfillment of the various portions of the plant to determine what payments are to be made by the owner to the contractor, and finally I would have to pass upon the acceptance of the constructed property as a whole where contracts were involved, and would have to direct the construction of the system under the company's own control where the work is not under contract. The customary and proper charge for this service is extremely variable, depending upon the volume of work and its character, and character of the engineering. The range is anywhere from five
374 to fifteen per cent, and I believe that six per cent would be a proper charge in a property like this on a location like this. That is the fee that I would expect if I were asked to handle work of this character. If it is a large property it would be a smaller percentage, and if a smaller property the per cent would be larger. I am doing work now in which the fee is ten per cent. It is smaller than this property.

In addition to the engineering expenses one of the items which any prudent man would provide against is the casualty liability. In this instance it involves and covers all of the liability that might be charged against the owner of the property during its construction, and covering not only the men at the works but the citizens of the community. Damage might result from openings left in the streets as construction of the property involves opening many of them and there is a hazard to the owner of the property. This would be covered by liability insurance. The figures that are generally found to me-t this kind of liability are 2% of the net construction cost of the equipment covered. That would be variable depending upon the amount. If you were spending the entire amount of money here involved on a greater hazard than the property as a whole involves, the 2% might be altogether too low. I think 2% would be fair for the construction of this property as a whole. I do not put it in here at all in the way of reimbursing the owner. It is here only as one of the necessary elements in determining the reproduction cost of the property. If the owner of the property took care of this liability by insurance he would have to pay for it. In addition to the engineering expense of 6%, and casualty liability of 2%, I have grouped taxes and loss of interest during construction, with a total of 4% for the two. This is included because the man who is building this property is necessarily losing the interest on the money tied up, prior to the date of operation of the plant, and he is also subject to some taxes. Three years would be required in reproducing this property as a whole.

The period of time during which the owner would have
375 to invest in the property without any return varies with different portions of the investment. If the reproduction of the

property was commenced on January 1, 1913, at the end of that year a portion of the equipment would be actually in use, but still a larger part of the investment would have been made without actually being in use, and, as an average, on the loss of interest on the unused portion of property plus the taxes on the unused portion prior to the time of operation, 4% of the net cost of construction of the property covered might be taken as a fair and reasonable figure. In some instances they compute one-half of the investment as ideal for the entire period of construction. If that was done in this case it would take three years to build the property and 6% for the three years on one-half of the investment would be 9% of the whole, which is too much. The 4% is a fixed sum on the net construction cost. It is just used once. In addition there are the 4% allowance on the net construction cost for omissions and contingencies.

In the building of a plant it is customary to allow a great deal more than 4% for omissions and contingencies because of the well-known fact that construction expenses nearly always exceed the original estimate due to the fact that the estimates are not made as complete through one reason or another as they might be. Here, however, we have a detailed inventory of the property and the chances of omissions are very much less than they would be if we were making up a list of elements in building a new property and we had no inventory and no physical equipment by which to guide ourselves. And yet the element of contingencies remains and if they were to reproduce this property today they would not be able to avoid that, and no matter how complete your inventory figures may be, 4% is a safe and conservative figure to allow. That gives a total of 16% for the four items which should be added to the net cost of construction. This 16% is added in Exhibit marked 7-D, which is headed Reproduction totals, and is a summary of the detailed infor-
376 mation contained in pages Exhibit E of my report. It shows the total reproduction cost of the work, the present per cent condition, and the present value. Also shows the depreciation annuities on both straight line and sinking fund basis of the four major classes of physical equipment, viz., real estate, buildings, works equipment, and distribution system. The net construction cost of the real estate is $21,700. 16% is not added to this, consequently the total reproduction cost and the net construction cost of the real estate is the same.

In Exhibit F is shown the net construction cost of the buildings, at $35,614. In Exhibit D the 16% is added, making $41,312, which is the reproduction cost. The net construction cost of the works equipment is $218,358, and adding the 16% gives $253,198, for the total reproduction cost. The net construction cost of the distribution system is $568,731, and in Exhibit the 16% is added, giving a total of $659,727, for the total reproduction cost. The total reproduction cost of the buildings, works equipment, and distribution system is $976,037.

Exhibit D, outside the reproduction cost of the four principal items of physical property, shows the present composite condition of the four major groups of equipment, and the present value, and the total

depreciation required on the straight line as well as on the sinking fund basis for each group, and for the total of the groups. By present per cent condition is meant the present physical condition of this property as compared with the same property when new. The real estate is 100%. It is as good as new or better. The buildings are 74.95% as good as when new. The works equipment is 77.67% as good, and the distribution system, 83.92%. I arrived at this percentage by taking each of the units considered and determining its age and then the average life of that kind of equipment, and I have done so in this report and it will be found in Exhibit 7-B, and also in Exhibit E.

Exhibit E shows first the name of the piece of equipment considered, then the total reproduction cost of that item, then its
377 age, then the average life. It is called the assumed life which is the average life of items of that kind. Then comes the present per cent condition of that item, then the present value of it, then the depreciation annuity required on straight line basis and then the depreciation required on a sinking fund basis for the same item. In order to get the present value item, having first determined the reproduction cost and then the age and the average life, we have tables which give us the present per cent condition. These are the results of observations and experience in many parts of the country by many men and are generally accepted and used. Then having determined the present per cent condition of the property the reproduction cost multiplied by that present per cent condition will give you the present value. If it has a present per cent condition of 50 its present value would be one-half of its reproduction cost. In each instance the figure shown as the total reproduction cost given opposite a given item is the result obtained by adding 16% to the net construction cost of the same item.

The age of the purifying house is given as 22 years, and the next column shows that the average life of a purifying house of this construction is 50 years. The next column shows the present per cent condition as 73. Any other piece of equipment that was 22 years old and had a life of 50 years would be in 73 per cent condition if it had the same age and same life. We do not divide the per cent condition in the middle if the piece of equipment was 25 years old because the depreciation does not work in a straight line. The depreciation accrues very much slower in the first half of the life of any equipment than it does in the last half. A piece of equipment having a life of 50 years and only 25 years old will be worth very much more than one-half its original value. On the other buildings we have treated them the same way. I have given as the present value of the purifying house, $14,074. That is arrived at by taking 73% of the reproduction cost of $19,279, 73% being the present per cent condition of that building. With reference to the purify-
378 ing house we have worked out here, first the net construction cost, second the reproduction cost, and from that and dealing with it as a separate and distinct piece of property we have worked out the amount it has depreciated on account of age and use, and have given the depreciation on that particular piece. I have not in

this report given a lump sum for the depreciation for the whole property but have given the depreciation on each piece separately. The totals shown for depreciation are those obtained by treating the items separately.

In determining the total operating expenses of a property it is necessary to know how much must be set aside each year because of depreciation. Depreciation is made up of three general heads, physical decay, obsolescence, and inadequacy. That does not include anything in the way of ordinary repair and maintenance. They are entirely separate. They are necessarily kept up out of the operating expenses whether you are laying by anything for depreciation or not. You have got to keep up your maintenance and current repair if you are going to keep your plant running, but in addition to all that there has to occur depreciation which is bound to control and must be in some way met. It has not been made in all cases in the past but it should have been, and to find out how much you should lay by on any given property you must treat them separately. You may keep on patching the flues of a boiler putting in new tubes or patching your shell and all that sort of thing. That is current repair and maintenance but the day will sometime come when you have to have a new boiler when you cannot keep it running with the ordinary current repairs, and for that time you must lay away a depreciation reserve in some way or other. That comes about, as stated, by physical obsolescence, and inadequacy.

By inadequacy in the case of a gas main I mean a case where the district grows up so rapidly around a given main that it is no longer large enough to supply the district and while it may be in perfect physical condition and good pipe, it is inadequate. Or you
379 may put in a machine at your plant or distribution equipment which is in perfect condition but has been superseded by new devices which are so much more efficient than the old that you cannot afford to use the old any longer. For instance, there is a water gas machine at this plant that you would not build a duplicate of today if you were building a duplicate set, though it is in good condition can *can* be used tomorrow and is valuable as a reserve unit, yet obsolescence has affected the value of that machine more than physical decay and more than inadequacy. I mentioned that to show that they were separate and each has its own value but they are necessarily found in arriving at the total figure to be used for depreciation because they vary from time to time with given pieces of equipment. In the case of this purifying house the straight line depreciation annuity is that amount which you must lay by each year if you lay by during each year the proportion of the amount of the reproduction cost as determined by the life of the equipment.

A piece of equipment having a life of 50 years would have a depreciation annuity on the straight line basis of one-fiftieth of its reproduction cost. You would lay by one-fiftieth of the reproduction cost each year. This is called the straight line basis because the apportionment is uniform during the life of the equipment, but that is not a fair basis for depreciation because, though it will give to the company the required amount of money at the end of the life of the

property to reproduce it, yet the public has a right to say that you are not a good business man or you wouldn't have to lay up your money that way. You wouldn't have to take a straight line amount in order to get yourself whole at the end of the life of this equipment. And they have a right to say that you do not use good business judgment or ordinary business judgment if you want to accumulate $100 at the end of 10 years by laying away $10 per year, but you may lay by an amount less than that which, when compounded annually, will yield you $100. At the end of the 10-year period you will
380 have the $100. Then the difficulty comes about with the sinking fund plan that there will be periods during the life of your plant when the money available there will not be sufficient to me-t your immediate demands. You will have to have more money at given periods than your sinking fund provides. So the straight line method is rather higher than the amount which should be set away and the sinking fund is lower. The straight line gives the company more than it has a right to claim and the sinking fund is below the legitimate allowance. The sinking fund will provide the necessary amount at the end of the fixed period but somewhere between those two points is where you should have it—where, I don't know. Somewhere between the original investment and the end of the life of the equipment the investor does not have his investment intact, or he does not have $100 worth of equipment and he should have the balance in his fund somewhere.

In the column, Straight Line Depreciation, the depreciation for the purifying house is the sum of $385.58 for straight line depreciation annuity. That means that the amount should be set aside each year on that basis. If the fund were started at the time the building was constructed and kept up annually the amount accumulated there plus the present value of the building at any particular time would give the reproduction cost of the property. The trouble with that is that the public has a right to say that you should not lay money by that way, that you should compound it. You can lay by a smaller amount than by the straight line method and compound it and have the required amount at the required time. I do not show a smaller return on the amount set apart for depreciation than I would allow on the physical property itself. You will get your full property back by the sinking fund basis at the end of the life of the property. In the meantime you have no use for the fund except to replace the building. You are not going to use it for 50 years because the building will live 50 years, and consequently the public has a right to say that you shall lay by only that amount which will enable you
381 to reach the reproduction cost at the end of the life of the building.

The figures, $197.80 shown under the column Depreciation Sinking Fund Basis, represent the amount that I think you are really entitled to set by because that sum compounded annually reproduces at the end of 50 years the same sum that $385.58 will reproduce, not compounded. If the $197.80 is paid annually and put out on good security and your interest collected promptly and compounded, at the end of 50 years it will produce $19,279 for the purifying house, the

amount that you started with. The Gas company could put the money into their own property and do that. That is the usual practice. The rate of return is different depending upon the length of time. The rate varies from 2½% to 3½% on the maximum and minimum lengths. I find the total reproduction cost of the generator house in Exhibit E to be $4,337. That is the net construction cost with the 16% added. That generator house is five years old and of a type of construction having an average life of 50 years, and its present per cent condition is 95, and its present value is $4,120. On the straight line basis, $86.74 must be set aside annually for depreciation; on the sinking fund basis, $44.49.

The next item in Exhibit E is the retort house. Its reproduction cost is $8,919. It has a net construction cost of $7,689, shown in Exhibit H. Its age is 22 years, life 50 years, and present per cent condition, 73, and the present value is $6,511. $178.38 should be set aside annually on a straight line basis for depreciation and $91.50 on the sinking fund basis. The reproduction cost of the meter and booster house is $3,035.00. It is 5 years old and has a life of 50 years. Its present per cent condition is 95, and its present value is $2,883. On a straight line basis, $60.70 should be set aside annually to profide for depreciation on it, and on a sinking fund basis, $31.13. The reproduction cost of that building was $2,616. For the coal shed the reproduction cost was $20.80, the net construction cost, $1,793. It is 22 years old, and its life is 25 years. Its present per cent condition is 25, and its present value, $520. There should be set
382 apart each year as a depreciation annuity, on a straight line basis, $83.20, and on a sinking fund basis, $57.05, to provide for this building.

The reproduction cost of the oil tank house is $1,807. Its net construction cost was $1,558. It was built 15 years ago and has a life of 50 years. Its present per cent condition is 83, and present value is $1,500. $36.14 should be set aside annually to provide for depreciation on a straight line basis, and $18.53 on a sinking fund basis. The reproduction cost of the oxide shed is $70. Its net construction cost was $60. It is three years old and has a life of 20 years. Its present per cent condition is 90, and the present value is $63. $3.50 should be set aside annually to provide for depreciation on a straight line basis, and $2.60 on the sinking fund basis. The reproduction cost of the stable and blacksmith shop is $949.90. Its net construction cost is $818.00. It was built 15 years ago, and has a life of 25 years, and its present per cent condition is 52, present value, $493. The straight line annuity would be $37.96, and the sinking fund basis, $26.03. The district holder booster house reproduction cost is $836. It was built 2 years ago. The life is 40 years. Its present per cent condition is 96, and it has a present value of $803. The straight line depreciation annuity is $20.90, and the sinking fund, $12.40. The total reproduction cost of all of the buildings separate and apart from the real estate is $41,312.

The composite life of all of the buildings is 46¼ years, and is determined by dividing the total reproduction cost of all of the buildings by the total straight line depreciation annuity for all of the

buildings. Since you have taken each building and divided its reproduction cost by its life, to get the straight line annuity, then, of course, the total of the straight line annuity divided into the total reproduction cost of all of the buildings will give the composite life. You get the composite present per cent condition of all of the buildings by dividing the present value which is $30,967, by the total reproduction cost, $41,312, which gives you 74.95. Exhibit
383 E-2, being 4 pages under the head of Works Equipment, shows the reproduction cost, the age, the life, the present per cent condition, the present value, the straight line depreciation, and the sinking fund depreciation for each separate item of works equipment.

Exhibit E-2 is offered and received in evidence.

The composite life of the works equipment is 32.13 years. The composite present per cent condition of the works equipment is 77.67. It is more than 77 per cent as good as new. Some portions of it are almost worthless and some are almost new but as a whole the present per cent condition of the works equipment is 77.67. The total reproduction cost of the works equipment is $253,298. The net construction cost is $218,358, as shown in subdivision F. The present value is $196,759. The difference of something like $57,000 between the reproduction cost and the present value of it is the depreciation. The total amount of depreciation annuity on the straight line basis for the works equipment is $7,882.93, and on the sinking fund basis it is $5,166.65. I have here the reproduction cost, the present value, the life, and assumed life, and the depreciation of the distribution department.

In order to determine the composite age of the distribution system I had to make some elaborate calculations and investigations. I have made them and have them here. The age of the buildings can usually be found from somebody on the ground and from the records, and sometimes there are marks on the stones, put on them 22 years ago, but in the distribution system you have to work back over the records to find out what the true composite age of all of the mains and services of the meters. It is not safe to make a guess and where the records are available you have to use them, and in this case the records of this company were available for 40 years back. The records of this company in this case are as good as those in other places but never have I found them as good for so long a period back as here. The detailed records worked back for a con-
384 siderable number of years and the basis on which the cost price of mains, services, and meters is based run back here for 40 years. This company started to operate and supply gas 40 years ago the 12th of this month.

The distribution system is found in Exhibit E-3. Exhibit O is a chart which I prepared from a study of the records. The history of the company is written in it. I ran through the records of the company for 40 years and found only the records for 3 years missing. The lower curve in the chart shows the increase in volume of gas sales each year. At the end of 1872 *they* were no gas sales. They

began in 1873. The heading columns on the chart indicate the gas sales per thousand cubic ft. and per year. When you get up to the fifth cross-section which is marked 10,000 you are selling ten thousand thousand or one million cubic ft. of gas each year. In 1912 the sales were 234,000,000 and some odd ft., and in 1899 the sales were approximately 43,000,000 ft., and the gain from 1873 to 1899, 26 years, was only 43,000,000 ft. This is important in showing the life of the property as it shows when the property must have been installed in order to take care of this increased service.

Exhibit O also shows the growth of the street mains and meters. The three years for which I could not find the records were 1900, 1901, and 1884. Exhibit O also shows the actual growth in the number of meters in use, the growth in number of house services, and in the number of street mains back to and including the year 1903. I have worked out these curves from certain changing ratios which I know have existed throughout this period more or less accurately, and have a close relation to gas sales. I am able to state now the reproduction cost of the street mains of the company in the city of Lincoln, and in Exhibit E-3 I have the data which show that details going to make up the total reproduction cost. The total reproduction cost of the street mains alone in Lincoln is $348,224. Their net construction cost was $300,195. By adding 16% to that you get the reproduction cost. The composite age of the street mains in the city of Lincoln I have determined and it is 10.86 years.
385 The mains as a whole have been in service a little over ten years. Their composite life is 36 years. The present per cent condition of those mains is 88.78. The present per cent condition does not apply to the paving, which is not depreciable. The present value of the street mains of this company in the city of Lincoln is $309,161. The straight line depreciation annuity is $9,670.88. The sinking fund annuity is $5,905.02.

The reproduction cost of the mains outside of Lincoln is $25,597. Their present value is $24,439. Their composite age is three years, and their life is 35.18. Their present per cent condition is 95.47. The straight line annuity for depreciation is $727.84, and the sinking fund annuity is $447.94. The total reproduction cost of all of the mains inside and outside of Lincoln is $373,821, and the present value is $333,600. Their composite age is 10.32 years, and their life is 35.95 years. Their present per cent condition is 89.44, and the straight line annuity for depreciation is $10,398.72, and the sinking fund annuity is $6,352.96. The total reproduction cost of the item grouped under Street Mains Miscellaneous is $21,086. The net construction cost is $18,177.

The street main drips, street main valves, and railroad crossings have been given the composite age of the main. The district governor is 5 years old. The distribution tools have been given a composite age of three years, and the gas appliances a composite age of two years. The drips have a life of 35 years, valves, 35 years, district governor, 30 years, railroad crossings, 35 years, distribution tools, 10 years, gas appliances, 5 years, and the composite life of all of the items grouped under street mains miscellaneous is 11.26 years. The

present per cent condition of the entire group is 72.74. The present value of all of the items in street mains miscellaneous is $15,340. The straight line depreciation annuity is $1,872.20, and the sinking fund annuity, $1,599.93. The reproduction cost of the services in Lincoln is $146,457. The net construction cost is $126,256. The present value is $112,958, which I arrived at through a knowledge of the composite age, composite life, and the present per cent
386 condition. The composite age is 7.6 years, life, 25 years, and the present per cent condition is 77.12. The straight line depreciation annuity is $5,858.28, and the sinking fund is $4,017.21, making the total reproduction cost of all services in and out of Lincoln, $151,774. The present value of the services outside of Lincoln is $4,494, and the total present value of all of the house services in and out of Lincoln is $117,902. The composite age of the services outside of Lincoln is 3 years, life, 25 years, present per cent condition, 93, and composite age of all services in and outside of Lincoln is 7.4 years, life, 25, and the present per cent condition of the depreciable portion, 77.74. The depreciation straight line annuity would be $6,070.92, and the sinking fund, $4,162.12, on all of the services in and outside of Lincoln.

The reproduction cost of all the service governors in Lincoln is $23,083. The net construction cost is $19,902. The present value is $20,157. The composite age is 4.8 years, life, 25 years, present per cent condition, 87.31. Straight line depreciation annuity is $923.44, and sinking fund is $623.24. The reconstruction cost of the service governors outside of Lincoln is $542, the present value, $504, the composite age, 3 years, life 25 years, present per cent condition, 93. Straight line depreciation annuity, $21.68, and sinking fund, $14.86, giving a total reproduction cost of all service governors, $23,628. The composite age is 4.8 years, composite life, 25 years, composite present per cent condition, 87.41, present value, $20,661. Straight line annuity depreciation, $945.12, and sinking fund, $648.10. The total reproduction cost of the service boxes and cocks is $12,825. The present value is $9,886. Composite age is 7.7 years, life, 25 years, present per cent condition, 77. Depreciation annuity, straight line basis, $513.56, sinking fund basis, $352.17.

The reproduction cost of the meters in use and in stock in Lincoln and in use and in stock outside of Lincoln, and the total, the
387 present value, the composite age, the life and the present per cent condition, the depreciation annuity on the straight line basis, and sinking fund basis, is all given in the Exhibit E-3. The total reproduction cost of the distribution system, as shown in Exhibit E-3, is $6,597.27, and its present value is $553,650. Its composite life is 28.9 years. Its composite present per cent condition is 83.92. The depreciation annuity on a straight line basis is $22,-863.72 and on the sinking fund basis is $15,216.85.

Coming back to the question of the composite age of the different parts of this property: The composite age of the buildings is arrived at by determining from local information the age of each of the buildings as a separate unit. This is easily arrived at. The composite age of the street mains, services, and of the meters is obtained

from the actual records of the company since, and including, 1903, and also from the curves which I have worked out as shown on Exhibit O, which were made, as explained, from the actual records of the company as to the gas sales back to 1873.

Exhibit O can be checked out with Exhibit Q which shows in feet the gas sales as they actually appear on the records from year to year, and in Exhibit Q is also shown the per cent of the 1912 sales, the sales of a given period, and I then have shown in another column the gain for that year in the per cent of the 1912 sales. For instance, in 1873 there was 1,421,000 ft. of gas sold, which is .6% of the 1912 gas sales. The Exhibit shows also, for instance, that only one-half of the present volume of business had been reached in 1904, after 29 years of operation.

Exhibit Q-2 shows the composite age of the street mains which as I stated above is determined from the actual records of the company back to 1903, and from the curve shown on Exhibit O prior to that time. The stars shown along the right hand side indicate that the figures are obtained from the curve on Exhibit O. For instance, for the first year, 1873, I estimated that at that time at least 9,000
388 ft. of mains existed. The number of feet of mains shown here is taken from the records of the company as fully as they were kept, but to get at the composite age of the mains that is as accurate as is necessary because the percentage is very small. To determine the composite age we first multiply the number of feet of mains for any given year by the present age, which gives you the number of foot-years. This is shown in the next column to the right. Carry the same process out for the gains made for each year and then take the total number of the mains at the end of the period and divide that by the total number of foot-years, and you have the composite age of the street mains. The foot-years is 5,559,184, which, divided by the number of feet, 511,538, gives the composite age. I believe this is the most accurate way of determining and estimating this figure.

Exhibit Q-3 gives the same information with respect to the house services. Exhibit Q-4 gives the same information for the meters. My figures on the composite age of the services and meters were based on the number of services and meters shown by the records of the company. These have since been gone over and there are some errors but for the purpose of determining the composite age it is immaterial because the composite amounts are so small to each year.

Exhibit L-1 is a tabulation of the manufacture of gas from 1902 and 1903 to 1912. The first column is for the year 1902, and shows, first, as indicated by the words to the left, the amount of the coal gas made during the year, the amount of water gas made, the total amount of gas made, the amount of gas delivered to the mains, the amount of gas sold, the amount of gas used by the company, the total gas used, and sold, the amount of gas unaccounted for, the per cent of gas unaccounted for, and the leakage of gas per mile of main, and the leakage per mile of 3-inch main. The next column is the same information for 1903, the next for 1904, and so on. The leak-

age per mile of actual main and the leakage per mile of main
389 reduced to a 3-inch basis is not shown for 1902, but it is for the remaining years. The per cent of leakage per mile of main really does not mean much of anything when you compare it with other systems because one main system may have a large composite diameter and another a small one, and the greater the diameter the main is, the greater your chance for leakage, and if you are going to get a constant so that your plant may be compared with different plants you must take some size of pipe as a standard, and in order to do that you must reduce your feet of main to the equivalent of a plant all of the same size of pipe. In this calculation it is the practice to reduce the distribution system to the basis of a 3-inch main, and the per cent of leakage is shown for the equivalent of a 3-inch system on this Exhibit. This is, as stated, for the purpose of getting a comparison between the leakage of this plant and other plants.

The gas unaccounted for shown here is made up of the gas that is actually lost through breaks and leakage, and also because of the difference in the temperature of the gas leaving the works and as it reaches the consumer's meter, and there is a loss due to the lowering of the temperature of gas which causes condensation of the actual moisture of the gas. As it travels through the distribution system it strikes changes in temperature which cause the deposit of moisture and for this reason it is necessary to have the drip pots round town to collect the condensation, and as that is taken out the volume of the gas is reduced. All of the gas is measured as it is made at the plant through two meters, which are checked against the increase or decrease of the amount on hand each day, and the readings of these meters are further corrected for changes in barometric pressure and in temperature of the outside air, and sometimes they are even corrected for changes in the vapor contents. My data for this tabulation was taken from the readings of these meters at the plant and the readings of the consumers' meters. I found the amount used
390 by the company. The per cent of leakage or unaccounted-for gas shown here is, I think, normal. The point is that a man watches figures like this to determine when it is going to pay him to make a special search for leaks. It costs a good deal of money to go systematically over a distribution system and find out just where the leaks are. Of course, when you strike a severe winter or where there are serious breakages in the mains you have got to get out and get those things fixed to keep running. After 1909 there is no showing for coal gas as there was none made after that.

Exhibit L-1 is offered and received in evidence.

Exhibit L-2 is a tabulation prepared by me showing the gross and net earnings of the company as taken from its records for the years 1902 to 1912 inclusive, which shows for each year the total amount received from the sale of gas, the average per thousand feet, the total meter charge, and the price per thousand feet, the item of forfeited discounts and the price per thousand feet, and the total earnings for gas from all of these items, and the average per thousand feet. It

shows the total amount to be deducted from this on account of bad debts, and the amount per thousand feet, which gives the total gross earnings, and the average per thousand cubic feet. It also shows the operating expenses yearly of the gas department, which amounts I have determined from an examination and study of the company's books and accounts, records, and other data, and for a number of years I have put in some additional items that should have been covered in operating expenses and which were not carried in their regular reports. It gives the total amount of the operating expenses and the average per thousand cubic feet, and then gives the net earnings by year in total amount and the average per thousand cubic feet, of gas sold exclusive of depreciation. I tabulated this data in this division for the purpose of assisting my judgment in determining the value of the property as a whole. The net earnings shown
391 here are exclusive of any allowance for depreciation.

Exhibit L-2 is offered and received in evidence.

The item of meter charge is the minimum amount of monthly bills allowed which the company requires where a meter is installed, and the amount of gas shown by the meter did not exceed the amount of this charge. The item of forfeited discounts represents the amount paid by the customers who fail to pay their bills within the specified period, and is the difference between the regular rate and the forfeited rate. Exhibit L-3 is a tabulation of the apportionment of operating expenses for the years 1903 to 1912 inclusive. It was made by me from the records of the company, this being necessary in determining what the operating costs really are. It is not sufficient to know that you spent one hundred thousand dollars on the manufacture of gas, but you must know why this was done. You must determine, in other words, where you spent the money, because of fixed expenses of the plant or whether it was spent because of the demand upon your plant resulting in the out-put of product, or whether you spent it because you have a large number of consumers or whether it is because you have a large number of meters. You have got to know all of these things about each division of manufacturing, distribution, collecting department, executive, and general office expenses, or you cannot make a thoroughly intelligent analysis of your own operating expenses, and this exhibit is the analysis of the operating expenses for this time. It is exclusive of depreciation and with the corrections which should be made in the net earnings which I will show later on. It shows in the first section or subdivision, for the first year, 1903, that the out-put expense of the plant was 46.37¢ per thousand cubic feet of gas sold, and the manufacturing expense was 5.48¢ per thousand cubic feet of gas sold. The first figure is the material used in making the gas. The next subdivision refers to the distribution expenses. Of the total distribution expenses for that year it shows that 4.51¢ per thousand cubic
392 feet were spent because of the distribution plant, as such. 2.74¢ per thousand cubic feet sold were spent because of the consumers, as such, and 1.68¢ per thousand cubic feet sold were spent because of the meters, because of the maintenance and repair, and

reading of the meters. The next subdivision is the analysis of the collection department and shows that in 1903, 3.43¢ per thousand cubic feet of gas sold were spent because of the consumers and 1.23¢ per thousand cubic feet was spent because of the meters. The next subdivision is executive department and general expense. This is all charged to the plant in the sum of 17.5¢ per thousand cubic feet sold for the year 1903. It was not chargeable to out-put, consumers, nor to meters. It was in the nature of a fixed charge not determined by volume nor number of consumers directly. This gives a total operating expense exclusive of depreciation, for 1903, of 82.94¢ per thousand cubic feet. The books of the company are kept with a view to showing these results and I secured the data from them.

Exhibit L-4, under the heading manufacturing department expense of coal gas, shows the manufacturing department expense per thousand cubic feet, in parts of a dollar, of coal gas alone for the years 1903 to 1909, inclusive. The first thing shown is the cost separately of the coal carbon, the enricher, bench fuel, then the total of the gas manufacturing material which for 1903 is 84.55¢. Then follows the residuals such as coke, tar, ammonia, and carbon, and their total, which total is deducted from the cost of the gas manufacturing material, and gives the net cost of the coal gas manufacturing material which for 1903 was 42.78¢. Then the additional items of the expense of retort house, labor, bench repairs, and retort house expenses, and their total in connection with the cost of generating coal gas is shown which, added to the net cost of the gas manufacturing material, amounts to 50.68¢ for the year 1903. Then follows
the general items entering into the manufacturing department
393 expenses. They are steam, purifying the coal gas, labor expense and repairs, purifying material, general works building repairs, as applied to coal gas only, general works apparatus repairs as applied to coal gas only, sundry labor works expense supplies, general supervision, district holder station, and then the total of these items, which is called the purification and storage, and then follows the total cost of the coal gas in the holder, which is, for 1903, the sum of 57.24¢ per thousand cubic feet of gas made, which is the cost in the holder at the plant for material and labor only as above shown. This in no way involves the expense of distribution or the expense maintenance of the plant, nor the expense of collection, management, or general expense. The blue print in connection with the Exhibit-4 shows by a line the fluctuation of this expense through the different years. There was a very large drop in the expense in 1905, which was recovered in 1906, and I discovered that it was only an apparent drop in cost as at that time the company had on hand a considerable supply of Pittsburg and Kansas coal. The Kansas coal is much cheaper and I found that they were using the Pittsburg coal and charging up the Kansas coal, and that accounts for the apparent low cost. The fluctuation of the different parts or subdivisions of this expense divided in L-4 is shown by the lines on the blue print.

Exhibit L-4 is offered and received in evidence.

Exhibit L-6 is the data which I have compiled from the books and records of the company for the years 1903 to 1912 inclusive, with

respect to the manufacturing expenses of water gas. For each of the years the classifications are as follows: first, steam for generating water gas, generator, fuel enricher, then the total water gas making material; second, the water gas tar residual account and then the net cost of the water gas manufacturing material. The next subdivision is the gas making labor, repairs to water gas general works apparatus,
and water gas generator house expense. Then is given the
394 total of the first two subdivisions being the total cost of generating water gas. The next subdivision represents the cost of the steam for purifying the water gas, the labor expense and repairs, purifying water gas material, general works repairs, and buildings, general works apparatus repairs, sundry labor works expense and supplies, general supervision, and district holder station. This last subdivision represents the total cost of purification and storage and the last line gives the total of the three subdivisions as the total cost of the water gas in the holder, which for 1903 was 48.89¢ per thousand cubic feet. Exhibit L-7 is a blue print showing graphically by lines the same thing which Exhibit L-6 shows.

Exhibit L-6 is offered and received in evidence.

Exhibit L-8 is a statement or tabulation showing the cost of mixed gas which was prepared by me from the records of the company. The mixed gas is the coal gas and the water gas that is sent into the distribution system. It is the mixture of these two gases which is distributed. Sometimes there are reasons at the time causing them to make coal gas and other times, water gas, and the ratio varies, and what you are compelled to find out is, of course, the cost of the mixture. You first find out the cost of each separately, and from that you determine the cost of the mixed gas, and then there are some items that affect the mixed gas that you do not need to take in in the separate gases. Exhibit L-8 is the tabulation of the cost of the mixed gas with the exception that for the last three years it applies to the water gas only as they were not making coal gas during that period. For each year in Exhibit L-8 the headings are as follows, the figures being all per thousand cubic feet until you get to the bottom: First, the total cost of manufacturing coal gas, which is taken from Exhibit L-4, then the total manufacturing cost of water gas, which is taken
from Exhibit L-6, then the total cost of manufacturing the
395 two. This figure is a composite average of the two preceding figures. The next heading is the total cost of the manufactured gas purchased. This does not apply in this case as they didn't have any. Then is the total cost of all gas manufactured, which is the same as the total coal and water gas. Then follows the out-put cost of gas lost and unaccounted for and the out-put cost of gas used by the company. The next is the total amount to be deducted from the total manufacturing costs, and then follows the net cost in the holder charged to the stock account. The next is the difference in the stock on hand the first and last of the year, and then the last is the exact cost, in the holder, of the gas sold. Accompanying Exhibit L-8 and marked Exhibit L-9, is a blue print which shows graphically by lines the same conclusions as appear on L-8.

Exhibit L-8 is offered and received in evidence.

Exhibit L-10 is a compilation prepared by me showing the distribution department expense per thousand cubic feet of gas sold for the years 1903 to 1912 inclusive. The following items are shown for each of the years: Street main maintenance, service maintenance, street department expense, meter maintenance, meter department expense, setting and removing meters, gratuitous work, the total of these items, gas lost and unaccounted for, total distribution expense. No item of expense of the collection department, executive department, or general expenses are included. Exhibit L-11 is a blue print showing by lines the same data.

Exhibit L-10 offered and received in evidence.

No item of depreciation is included in this tabulation. Exhibit L-12 is a tabulation of the collection department expense per thousand cubic feet of gas sold for the years 1903 to 1912 inclusive. It was prepared by me from the books and records of the company and is divided into the following items for each of the years: reading meters, collection, clerical salaries, collection office expense, rent of collection office, delivering bills, outside collection, and total
396 collection expenses. Exhibit L-13 shows the same information in a graphic way by means of lines.

Exhibit L-12 is offered and received in evidence.

Exhibit L-14 is a compilation showing the executive department, general expense, per thousand cubic feet of gas sold for the years 1903 to 1912 inclusive. It was prepared by me from the books of the company. The expense is shown under the following items: executive salaries and general clerical salaries, general office expense, incidental expense, rent of executive office, legal expense, and the total of these items. Then the items of promoting new business and taxes, then the total general expenses is given. Exhibit L-15 is a blue print showing by lines the run of this expense in a more graphic manner.

Exhibit L-14 is offered and received in evidence.

I have had prepared from the records of the company upon a skeleton which I provided, a tabulation of the consumers for the year 1912. Exhibit M is this tabulation. The consumers were grouped according to their average monthly consumption of gas into 26 different groups. The first column to the left of the exhibit shows the group number. The next column shows the average monthly consumption of gas of the consumers in that group. The first group is those consumers who take less than 500 feet of gas per month. The second group is those who take from 500 to 1,000 feet, and the amount for each group is thus shown in this column. The third column shows the number of consumers in each group, and the last column shows the percentage of the total number of consumers that the particular group represents. For instance, in the first column there were 455 consumers throughout the year 1912, who used less than 500 feet of gas per month on an average, and these 455 con-

sumers represented 5.9%, as shown in the last column, of the total number of consumers at that time. On everything except the very small item of maintenance of the equipment itself, it costs
397 just as much to take care of the consumers who take 500 cubic feet per month as it does to take care of the ones who take 100,000 cubic feet per month. You have to spend just as much time in reading the meter, collecting the bills, making the bills, and rent and the maintenance charges of the larger equipment of the big consumers is the same as in the smaller ones. The only added expense by reason of the large consumer is the actual production cost of the gas used. The more consumers you have for the volume of gas sold the less is the net profit as compared with the smaller number of consumers. There is always a considerable number of the small consumers who are being served at a loss to the company where the rates are as they are here.

Exhibit M offered and received in evidence.

Exhibit N is a tabulation showing the gas sales outside of the city of Lincoln, at the State Farm and adjoining residences, and Havelock and University Place, for the years 1905 to 1912 inclusive. It shows in cubic feet the total amount sold each year in each place, and the total amount sold in all of the places each year, and the total amount sold in all three of the places for the entire period, and likewise the gross receipts for the sales. I prepared Exhibit N so that the sales outside the city of Lincoln can be segregated from those within the city.

Exhibit N offered and received in evidence.

In going over the detailed records of the company for the last ten years outside the few minor errors due to the transcribing and which were easily corrected, I found that certain excess credits had been made during those years for residuals and at the same time I considered that it would be advisable to show how the gross earnings and operating expenses of the company would be affected by the sales outside of Lincoln, and also to show how the operating expenses would be affected by a correct allotment of the depreciation charges.
398 This I have shown on Exhibit P, together with some additional data. I first started with the year 1912 because that is when I got the total reproduction cost of the property, and that is what I had to start with. Having determined these things for that year I found that I could work back from that with the material that I had at hand and ascertain the present value of the property for each of the years back to 1907. In the first place, in this tabulation, I have re-adjusted the operating expense and sales by excluding the gas sold outside of Lincoln, and the expense on account of that, and have shown upon this tabulation what the gross earnings, the operating expense, and net operating earnings were without that business.

On going over the records I discovered that an arbitrary credit had been made to the cost of manufacturing water gas for the tar residual. Someone had taken a unit and said, for each thousand feet of water gas made we will give the water gas manufacturing expense credit

for so much tar in the form of money on the books. At the end of 1912 they went to check up the tar that the books showed was on hand and it wasn't there. The allowance had been greater than the facts justified. Universal experience shows that the tar made in the water gas process varies between 5% and 15% of the total volume of oil used. 10% of the oil used is a fair average. A greater credit than that had been made and there had to come a time of reckoning, and it came at the end of the year 1912. I was advised by the company that the tar was not there. They had been selling the tar practically as fast as it was made while the records showed that they had a good deal of it on hand. The correction of this error affects but the years 1911 and 1912.

Now to illustrate the corrections on account of the gas sold outside. In 1907 the reported gross earnings of the gas department were $215,776.20. The gross sales outside of Lincoln were $888. This sum, deducted from the total gross earnings, gives $214,888.20, which are the gross sales in Lincoln. Now for the same year the operating expenses as reported were $141,924.37. This includes the operating expense on account of the outside business, the amount of which is ascertained as $302.88 by taking the actual sales outside of Lincoln in cubic feet and multiplying that by the actual output cost of the gas for 1907. Deducting this added expense of $302.88 gives the correct operating expense for 1907 in Lincoln as $141,621.49. This correction is worked out in the same way for each of the years subsequent to 1907, down to and including 1912.

399

In 1911, after making the correction on both sides for outside sales, the gross earnings for Lincoln are $268,021.97, and the operating expenses were $157,189.73. At this point the error on account of the tar residual is wiped out and for this year we charge off $2,859.86 on account of that, and $2,722.23 was charged off in 1912. These figures amount to 1¢ per thousand cubic feet of gas. Prior to 1912 they had been taking credit for 80% more than that, or 1.8¢ per thousand cubic feet of gas. There was a shortage on account of this tar residual error in actual dollars on the books of the company, and by making these additions in dollars and cents in 1911 and 1912 to the operating expense, I balanced that shortage.

For the year 1912, after making the corrections on both sides on account of outside business, the gross earnings of the gas department for Lincoln proper were $273,175.93, and the operating expenses were $173,689.87, to which we should add the amount charged off on account of the tar, which is $2,722.23. In addition, there should be added to the actual operating expense the item of depreciation. I have added $20,865.03, which is the amount which my detailed valuation shows is what is required to be set aside annually on a sinking fund basis to reproduce the property as it now stands. This depreciation is shown in Exhibit D, the last figure in the last column. The addition of this amount brings the total operating expenses for 1912 for the gas department for Lincoln proper, to $197,277.13, and the corrected net earnings are the difference between this sum and the corrected gross earnings, or $75,898.80.

400

This item of depreciation is certainly an operating expense. It must be provided for annually out of the gross proceeds for if you don't do it that way, you will have to produce it all at once which is a very difficult thing to do, and it is just as legitimately and properly an operating expense and enters into the cost of the gas that is sold from year to year as is the payment that is made for collecting, oil, or labor.

Now having the inventory of all of the property as of January 1, 1913, showing the total reproduction cost to be $976,037, and having the age of the various pieces of equipment in this inventory, I am able to determine the value of the property as of January 1, 1912 by deducting the amounts which the inventory shows were added during the year 1912. It would be impossible to go to the books and find how much of this had been done each year, but I can get it from the inventory. For instance, in 1909, there was added real estate. valued at $7,750, which was a part of the total value at the end of 1909, and to ascertain the value of the property at the end of 1908 this is one of the items which must be deducted. Of course, the real estate is not taken into account in figuring depreciation. The depreciation for the year 1911 is arrived at by deducting from the total reproduction cost of the physical equipment as found at the end of 1912 the value of all of the real estate and the value of any additions made in 1912, and on that balance is calculated the depreciation. I ascertained the additions made in 1912 by taking out the items according to their ages. If an item was one year old in this inventory it was put in during the last year. After making the deduction for all of the real estate and for the items added during 1912 you have the total which is depreciable at the end of 1911. Knowing from my
401 1912 figures what the composite rate of depreciation is on the sinking fund basis, I applied that to the depreciable amount for 1911, and secured the depreciation allowance for 1911 on a sinking fund basis. This is $20,183, which brings the correct operating expenses of the gas department, as applied to Lincoln, to $180,232.59, and the corrected net earnings, $87,789.38. This same process is repeated from year to year. For 1910 it gives the net earnings of $86,242.99, and the depreciation for that year is $19,111. In 1909 it gives the corrected net earnings as $91,708.49, and the depreciation is $17,780. For 1908 it makes the corrected net earnings $80,678.85, and the depreciation annuity is $15,588. For 1907 it makes the corrected net earnings $58,121.71, and the depreciation on the sinking fund basis, $14,955. I do not have here the figures showing the depreciation on a straight line basis for these years as I have shown them on Exhibit P, but the amount of the depreciation each year on the straight line basis would be increased at the ratio of $20,865 to $31,629.

Exhibit P offered and received in evidence.

In addition to the items already given in determining the present value of this property I have considered the items of organization and legal expenses that would be involved in reproducing the property, the present working capital of the property, and its present

going value. These items have not appeared in any of the figures so far given. Exhibit A is a tabulation showing the amount of organization and legal expense for a property of this kind. This represents the expense of a preliminary engineering investigation, the cost of preparing articles of incorporation and making and certifying abstracts, drawing and examining contracts, and general retaining fees of lawyers. The salaries of the manager and his assistants and clerical force during the period of the construction, the incidental and traveling expense of these men during that period, and the rent of
his office and incidental expenses like stationery and supplies
402 during the same period are also included. I have had occasion
to work out things like this on other property a number of times and have talked with lawyers and bankers and have gone through the thing with operators of gas properties, and have had the benefit of their experience. From the conception of the scheme of reproducing the property would require three years to complete. I have only charged rent and stationery expense and other expenses for two years because that would be the average time during which those charges would be applicable since a portion of the plant is going to be in operation while the others are being built. The first item, preliminary investigation, covers the commercial phase of the engineering work on the job. It is the expense incident to looking the situation over and determining whether it is advisable to engage in the enterprise, and determining the engineering difficulties and ascertaining all of the conditions which would tend to show whether or not it is going to be a profitable enterprise. It requires a study of the town and its surroundings and its possibilities, so that one would be able to tell his client whether to put his money into it or stay out. It is the same expense that railroads incur in studying out situations to determine whether or not to extend their lines into certain portions of the country. I consider $3,000 as the customary and reasonable charge for this service. The second charge of preparing articles of incorporation, making and certifying abstracts, and including a general retaining fee would follow the completion of the preliminary investigations. You do not find these companies with their articles of incorporation and all of this work done when you come to determine the cost of reproducing the property. Whenever a plant is built somebody has to foot all of these expenses. This includes the incidental expenses such as are involved in getting a franchise, the time of someone to look after that, and seeing that it is properly prepared
in view of the laws of the state where the property is put in
403 service. I consider the amount entered here, $7,500, for this
work as fair and reasonable. It might be easily exceeded but I think it could be done for that. The third item represents the salary of manager and clerical force during construction. There certainly would be a manager's salary to pay while the plant was under construction. You would require a man who is not only conversant with a gas plant already established but one who is familiar with the various construction details so that he can direct the work in general in the absence of the man in charge of the work or in cooperation with him. In addition, there would be work for him in

getting in touch with the business interests of the town. His work would not be required so much at the plant as it would be in the preparation of the community for the coming of this utility. It is in the nature of missionary work and he must do a great deal of advertising and development. I consider the charge made, $18,000, for this a reasonable and fair charge and customary in the building of property of this size. The next item, incidental and traveling expenses, is due to the fact that there are always disputes through delays and misunderstandings in connection with the contracts, and the manager of the company has to travel frequently around the country to the shops of the builders to see why his stuff is not coming through, or why this is being done instead of that. Or he must go to adjoining towns to see what he must adapt to his local situation, and the development of this business involves an expenditure of money and I consider the charge of $2,500 for this work as reasonable by men who are actually building properties. I have built several gas properties and know that expenses of this kind always run higher than we expect them to, and they are always considered and taken into account. By the item of rent and stationery I mean that while this plant is under construction you must have a headquarters some place, and while you are not an operating concern you will have these expenses just the same, and they must go into your construction cost somewhere. The total cost of these items, organization
404 and legal expense, entering into the reproduction of a property of this kind might very fairly and reasonably be $33,000 starting from a town to supply. This amount of $33,000 included here is not affected by my deduction for depreciation. It is a permanent thing and a permanent value as long as you are doing business.

Exhibit A offered and received in evidence.

In addition to the physical property gone over I have included in my tabulation and report the item of working capital which enters into the present value of the property and is a part of the investment of the owners in order to serve the public and continue the business and operate the property. It is necessary to have a certain amount of money tied up in different forms in addition to the physical property itself. The items making up this investment are shown in Exhibit BB. What I have tried to arrive at here is a net working capital. The company in the ordinary conduct of its business has certain amounts owing it and, on the other hand, owes other people certain amounts for the current operation of its business, and what we are trying to arrive at is the difference between the two. That is the excess of credits over debits, which is the amount of money which the company must have as working capital to carry on its business. If those debits exceed the credits there would be a deduction in value. I have reduced my working capital here to a minimum and I have here what I actually found was the working capital at the time I made the examination. I found here an amount which looks like a reasonable working capital for the business being done, and for a concern of this size. The additional credit you can get through purchasing power is reflected in the value of the property as a whole and

not in the present worth of the working capital. If you can buy better than somebody else that appears directly in one form or another in the valuation placed upon the property. If the company can buy $40,000 worth of coal on credit and owes the bank
405 $40,000 I would off-set one against the other and would not give the company credit for having an investment on either item for the benefit of the public. The fact that it has been able to do that appears through the valuation of the details and the consideration of the income and operating expenses.

The items making up the working capital here are material and supplies, $16,334.42; accounts receivable, $35,431.75; advanced insurance and expenses paid in advance, $8,324.07; cash on hand, $2,105.84; cash in banks, $56,920.39; a total of $119,116.47. Then I have added bills payable; $32,000, accounts payable $4,588.18; unpaid wages and salaries, $2,903.71; coupons and interest, $3,944.26; customers' discounts, $2,533.83; main extension deposits, $1,108.83; a total of $47,078.84. These are all obligations inherent in the ordinary current operation of this business and they do not include anything not directly concerned with the manufacturing and distribution of gas.

The item, customers' deposits, is one of the items deducted from the amount of working capital because the gas and electric light consumers in Lincoln have deposited with the company $3,167.29 in order to get certain service, and that sum is owing to them. I have taken 80% of that sum as the gas consumers are about 80% of the total electric and gas consumers. That, in my judgment, should be the apportionment on the amount as that is one of the things that cannot be arrived at any closer. The same apportionment is made on office stock, and the gas making materials. The item of insurance under expenses paid in advance I divided two-thirds to the gas and one-third to the electric which is approximately correct. The hay accounts I have apportioned 80%, and the main extensions I have apportioned 80%. Main extension deposits means that in some cases consumers living farther than the usual distance from the end of a main have advanced money to the company for the purpose of getting that main extended to them with the understanding that it is to be paid back when enough consumers have been taken in on
406 that line to warrant paying the deposit *it* back. The item accounts receivable, $35,431.75, is made up of gas bills for the current month and unpaid at the time of the investigation, $18,059.32; Gas arrears or bills which should have been paid on the discount day but have not been, $3,822.68; credit ledger accounts, $13,333.30, which is 80% of the total. These accounts are for appliances and equipment, coke products other than the gas itself. Also this item includes general ledger accounts for materials purchased of the company, $216.45, which is 80% of the total. The accounts receivable represent principally the amount which the company invests in the manufacture of gas and which it has to carry between the time the gas is made and the time it is paid for, and is an investment in addition to the physical properties of the company. The details of the several items appearing on the first page are shown on the fol-

lowing pages. The items making up the amount for gas materials are also secured from an actual inventory of the materials, and the others were secured from an examination of the records of the company with Mr. Phillips. The items show an actual condition rather than a theoretical one, the only theory to it being the apportionment of 80% and 20% between the two departments on some of the items mentioned.

After making the deductions of the charges against the working capital the net working capital is $72,037.63, which should be added to the present value of the physical property in order to determine the investment of the owners because the property could not be operated without this additional investment, and because there is a distinct value there and if you were taking the property over you should be willing to pay for that value. This is a very reasonable amount. It will vary from month to month and in different parts of the country plants of the same size will require different amounts because of varying labor weather conditions. They sometimes carry enormous supplies of raw material.

407 Exhibit BB offered and received in evidence.

The remaining item entering into the value of the property which we have not yet gone over is going value, which is shown under Exhibit K. In the determination of the going value of the property such as this the matters of franchise and good-will have no bearing. They are totally distinct and are not a part in any way of the going value, as I have used the term here, and as I have determined the going value here. The going value of this property is that value which exists between the total value of the property as a whole and the present value of its physical equipment alone. It is not something that you can lay aside from the physical equipment and say here is your going value and here is your equipment, because they are necessarily combined. It is, you might say, a characteristic of the equipment and business of the property, and the determination of the amount of it is the only problem. There is no question as to its existence. The difficulty is in measuring it. The only rational method that I have been able to find is the one that I have used here which is based upon the assumption that a man comes here to buy this property as a whole and he finds that a certain selling price is placed on it. He then makes his examination of all of the physical equipment as I have made here and reduces it to its present value the same as I have done and he finds that there is a margin between the present value of the physical equipment and the selling price at which the property is held. He then has to determine whether he can afford to pay as much as that difference for the going value. The property has no good-will in the sense that a merchant may have good-will because you either use gas bought from this company or you don't use any. You can use other fuels. There are several here but if you are going to use gas at all you will buy it from this company so there isn't any good-will as such. And there isn't any franchise value. Whether the company has a franchise or not it has

no value which should be included in determining the value
408 of the property as a whole unless the company has actually paid a specific sum for the franchise and I know of no such sum having been paid here.

But, coming back to the man who has discovered the difference between the present value of all of the physical property plus its working capital and its organization and legal expenses and the price at which it is held, we must now set about to determine whether he can afford to pay that much money for the going value of this property, and the only consistent way that I know of to do this is to go through as nearly as we can each of the steps you would necessarily go through in reproducing all of this property and business. To do that we must assume that a town identical with Lincoln in all respects except there is none of the property or business that we are discussing here as property and business of this gas company. In all other respects it is the same. This man conceives the notion of reproducing this property, and he figures up all of the expenses that will be necessary in reproducing the property as a physical entity, and as soon as portions of it are ready he figures on actually making gas and he knows if he goes at it aggressively enough and he is sufficiently capable he can in time work up a business which will be equal in all respects of the advanced business of the going company. So he makes an inventory like the one we have built up here and picks out those items of expense which he would have to meet during the first year of the reproduction of the property and during the first year, say 1913, he would spend for preliminary investigation the $3,000 we have already outlined, and of the amount included for preparing articles and matters of that kind he would spend $4,000 the first year, $1,750 the second year, and the same amount the third year. The salaries of his manager and his assistants during construction would apply only to the first two years in the sum of $9,000 each
409 year. The incidental and traveling expenses would likewise be spent between the first two years as well as the rent and stationery amounting to $1,000 during each of those years. He would also buy certain parcels of real estate being the reproduction cost, as shown in my report here, of $11,000. The second year he would take additional amount of real estate at $9,000, and the third year the still additional amount of $17,000. During the first year he would get far enough along so he could build a purifying house at the reproduction cost of $19,279. During the second year he would build his generator house, and so forth down through the entire list of physical equipment, and in the Exhibit I have placed in each year the amount represented, as in my opinion, they would actually be called for. The whole purpose of the tabulation is to show how much money the man would have to spend during each of the three years on the physical equipment, the result being shown on the third page, as follows: for physical equipment plus the working capital he would have advanced during 1913, the first year, a total of $377,222. In the second year he would have spent $362,536, and in the third year, $341,317. Having determined approximately the periods and the amount of investment necessary to reproduce the physical equipment

we must now endeavor to see how fast the business could be built up in this hypothetical town, so the expenditures have been planned in a way that will give the maximum business in the minimum time consistent with safe construction and good workmanship, but before going into that the plant must be carried a few years into the future, and that has been done here, based upon the growth of this property in this town which I have ascertained from the records here, and such knowledge as I have of other properties in other towns. I estimate that at the end of 1913 this going plant, the plant which is now here and in operation, will have 8,857 meters in use. At the end of the next year it will have 9,321 meters in use, and for the succeeding years until at the end of 1918 the going plant in Lincoln
410 will actually have in use 11,250 meters. Now in the theoretical plant the man would be able to place during the first year 2,000 meters but he would not be able to make gas through the whole year, and my estimate is that he would only have gas to sell in that town during the last two months of the first year, and he would have the equivalent of 333 meters in use throughout the year. In addition, when you first put the consumer on he does not burn as much gas as he does later. The average consumption per meter continually increases in all towns that I know of, and I have estimated that those new consumers that are first put on in 1913 in the hypothetical plant are only using 40% of the going plant's consumption per meter per year. This would give you for your first year, 1913, a total sale of 3,730 thousand cubic feet of gas in your hypothetical plant. I have carried the same calculation through each of the several years for the hypothetical plant and in 1917 I bring the total number of meters in the hypothetical plant up to those in the going plant, and by the end of 1918 in all other respects the two plants get into parallel operation. In other words, though the going plant will have to do business, extend its equipment, and take on additional meters during all of those six years, at the end of the year 1918 this hypothetical plant could not only have been built but its business could have been developed to a point where it equals in all respects the business of the going plant at the end of the same time. In this calculation I have given the existing plant the worst of it as I have allowed the hypothetical to build up a business in six years which the existing plant has taken forty years to develop, but while that is developed very rapidly, it could be done if you had a town like this and money behind you and you were to go after it. Having determined the rate at which the new plant is going to acquire this business it is necessary to ascertain what the existing plant is going to do during the same period in the way of increased business
411 and earnings. I have made a study of that based upon all of the records of past experience in the going company together with such additional information as I have concerning the price of raw material and labor now and prospective, and I show on the next page of the Exhibit a summary of the operating expenses of the going plant exclusive of depreciation and interest charges during each of the next six years, and it shows for 1913 the total operation and maintenance of the going plant exclusive of depreciation and

interest which is per thousand cubic feet of gas sold. I have shown this for each of the years, 1913 to 1918 inclusive. These totals make up the aggregate operating expenses except depreciation and have been arrived at through the three pages of details immediately following in which all of the items of expense as now carried on the books of the company are treated separately through each of the six years in advance. I have done this in view of the past experience of the company and the present conditions and I think that the operating costs per thousand cubic feet of gas which I have shown in figures may reasonably be expected to be as I have estimated them. To compare with this it becomes important to know what the operating expense and income of the hypothetical plant is going to be, so I have made another table running through the same six years being based upon the volume of business the hypothetical plant is to pick up, and the operating expenses based upon the actual records of the existing company, and affected as they would be by conditions under which the hypothetical plant would be operated during the first two years of its life. It is natural that the operating expenses would be higher at first than the operating expenses of the going plant because it has got a lot of money invested and is only using a part of it. It has a new organization and is buying materials in small quantities, and it is making small quantities of gas, and its operating results are inefficient. It lacks organization. I estimate
412 that the total gas made in 1913 per thousand cubic feet of gas sold would cost an operating expense, exclusive of depreciation and interest charges, of $1.66 per thousand feet. It would cost them more to make the gas that first year than they would get for it. The second year, 1914, they would do considerably better, and the corresponding figure estimated for that year would be $1.242. In 1915 it would be $1.0304; in 1916, 90.29¢; in 1917, 82.45¢; in 1918, 82.59¢. In the last year it has reached the economies of the present plant with its increased business. For the going plant the same figures are as follows: For 1913, 81.39¢; 1914, 82.02¢; 1915, 81.86¢; 1916, 82.46¢; 1917, 82.03¢; 1918, 82.13¢. It then becomes necessary to make an abstract of the gross earnings and of the total operation and maintenance and of the depreciation annuity of the going plant to determine what its net earnings will be during each of the next six years. Assuming that there is a population here of 47,000, the gas sales for 1913 will be $298,567, an increase of $16,405 over the 1912 gross earnings, or 5.8%. The total cost of operating and maintenance of the going plant for the same year would be $201,851. The depreciation annuity on the sinking fund basis will be $20,865. Adding the total operating and maintenance to the depreciation annuity makes the operating expenses for 1913, $222,716. Deducting this from the gross earnings gives the net earnings of the going plant for 1913 of $75,851, but what we are trying to arrive at is the going value of this property as of today, and a dollar that we are going to get a year hence is worth less than it is today by that amount which would produce a dollar at the end of the year by compounding. So I have taken a 6% factor for the present worth and have reduced the net earnings for the year 1913 by that

factor, which gives us a present worth of $71,558 for the net earnings to be received a year hence. I have made the same computation for each of the succeeding years up to and including 1918. The hypothetical plant is entitled to have an additional credit from the fact that the man who is going to buy the property must have
413 the money and if he is going to *to* build a new plant instead of buying the existing one, that money will be put into the bank at interest until it has to go into his property, and this credit to the hypothetical plant tends to reduce the difference between the going plant and the hypothetical plant valuation. I have here an interest table based upon the amount of money required for the replacement of physical equipment and the working capital of the going plant with the reproduction expenditures shown on the first few pages of this exhibit. This is made before we have any special notion as to the going value of the property in dollars. This calculation makes no allowance for the additional interest credit which will come from the going value allowance. I put it in later after it has been determined. Starting with column one on the interest table there is there shown the total investment in the hypothetical plant at the end of the year 1913, of $377,222. The amount left in the bank is the difference between this sum and the total amount which he is starting with, or $703,853. The interest on that sum for the first year, at 2½%, is $17,596. In addition, the amount that he withdrew during the year he would draw interest on at 2% for one-half year, and he would be drawing it out in approximately uniform amounts, and the interest on that portion would be $3,772 for the first year, making a total interest for 1913 of $21,368. In the same way the interest credit for 1914 is $12,150, and in 1915, $3,413. Adding to the interest for the first year the gross amounts of the sales from the hypothetical plant which would be $4,491, we have the gross revenue of the hypothetical plant for the first year, which is $25,859. The operation and maintenance expense of the same plant as we have already shown for the year 1913, would be $6,202. The depreciation annuity on the hypothetical plant, and depreciation begins as soon as your plant is started, would be at the same rate we found in the sinking fund of the going plant as applied to the
414 depreciable portion of the property installed during the first year, and would be $4,031, making the total operating expense of $10,233, which gives the net earnings of the hypothetical plant for the first year, $15,626. This sum is also an amount which is to be realized a year from today, so it must be reduced by the factor for present worth to what it is worth today, and this gives a present worth for the net earnings of the hypothetical plant for 1913, of $14,742. This is what the hypothetical plant actually makes during the first year but it is made through the credit of the interest on unemployed capital. The second year there is a deficit but the third year they begin to grow, and at the end of 1918 the hypothetical plant would have net earnings of $95,536 which, reduced by the factor for present worth, would give a present worth of the net earnings of that year, of $67,353. Now having ascertained what each of the plants are going to do during those several years we make a

comparison and in one column we show the present worth of the net future earnings of the going plant for each of the years from 1913 to 1918 inclusive, and in another column we show the present worth of the net future earnings of the hypothetical plant for the same years, and in the third column we show the difference between the two preceding columns, and after we have shown for the first year the present worth of the net future earnings for the year 1913 of the going plant, which are $71,558, and of the hypothetical plant, $14,742, we find that in point of actual value alone the going plant for the operation of that one year would have an advantage over the hypothetical plant of $56,816. Carrying the figures through the respective years to the point when the plants become parallel in operation and adding the difference we find the aggregate difference in value between the two properties in favor of the going property is $238,190. This is before we have given the hypothetical plant any credit for interest that would be paid on the money which the man would have for this going value item. If the man is going to
415 buy the existing property he must have enough money not only to buy the physical equipment but also the going value, and consequently the money represented by the going value in the purchase would also be in the bank, and be drawing interest which would go to increase the difference between the valuation of these two properties, because it would tend to decrease the net cost of building up the business of the hypothetical plant. We know that if we take this full sum, $238,190, and add that to the original amount which the man carries through his interest calculation we are going to arrive at a figure that is higher than this, and therefore we know it is too high so we have to take some figure that is lower. In other words, the going value is less than the figure shown here by a certain amount which can be determined by a short cut calculation in such a way that when we do take the credit of the going value in the bank and take the credit for the interest on that amount we will arrive at the same amount you put in as working capital. That is the check of the accuracy of this calculation. I have done that on the next page. I have added to the interest calculation the apportionment of the differences through each of the several years that is represented by the going value allowance of $225,000. I have carried through exactly the same calculation I have shown for the hypothetical plant and have arrived at the present worth of the net future returns of the hypothetical plant exactly as before with only the changes due to the including of the going value amount. By that process the present worth of the net future earnings of the hypothetical plant is increased. There remains, then, to make only the final comparison between the corrected net future earnings of the hypothetical plant with the expected net future returns of the going plant, and that I have done on the last page. In 1913 the present worth of the net future earnings of the going plant were $71,558. The present worth of the net future earnings of the hypothetical plant for the same year with the allowance for interest on the
416 going value, is $19,958, and the difference between them for that year is $51,573 in favor of the going plant. These dif-

ferences are carried out year by year until at the end of the period when the two plants get into parallel operation there is a difference in value on this calculation of $227,138. Since we started with $225,000 and we finish with $227,138, the correct figure to use as going value is between these two amounts, and as the difference is so slight I did not go through the calculation again to find it. It can be figured so that the figure you wind up with is exactly the same that you started with, but it is so close that I have taken $225,000. That is what I consider a justification for including the $225,000 as going value for this particular plant. The conclusions that I have made and which are shown in Exhibit K and running through some sixteen pages have been prepared by me based upon the property here in this case. I have given the same consideration to the hypothetical plant as I have given to the plant that is here. The items of depreciation and working capital and development of business of the existing plant are all based upon the data that is included in this report with respect to that plant, and this is simply a process of carrying out and extending the plant for six years and comparing that with what the hypothetical plant would be able to do if it was built in another city in all respects similar to this city.

Exhibit K offered and received in evidence.

On the first page of Exhibit P I have shown the items making up the reproduction cost and the present value of the property of the Lincoln Gas & Electric Light Co., used in its gas department in Lincoln as of January 1, 1913. The reproduction cost of the organization and legal expense is $33,000, and the present value the same. The reproduction cost of the working capital is $72,038, and the present value is the same. The reproduction cost of the real estate is
$21,700, and the present value is the same. The reproduction
417 cost of the buildings is $41,312. Present value, $30,967.
The reproduction cost of the works equipment is $253,298, the present value is $196,759. The reproduction cost of the distribution system is $659,727, and the present value is $553,650. The reproduction cost of the going value is $225,000, the present value the same. The total reproduction cost is $1,306,075, and the present value is $1,133,114. This represents, in my judgment, the cost of reproduction and the present value of this property as of January 1, 1913.

The net earnings of the company for the gas department for 1912 were, as shown in Exhibit P, $75,898.80, which is a return of 6.698% on the present value of the property at the current rate for gas, which is $1.2039 per thousand cubic feet. The earnings for the year 1911 upon the same value is 5.81% at the same rate for gas. For the year 1911 the corrected net earnings of the gas department on the then present value of the property was 8.029%, and on the then reproduction cost, 6.942%. For the year 1910 the corrected net earnings of the gas department were 8.437% on the then present value, and 7.288% on the then reproduction cost. For the year 1909 the corrected net earnings on the then present value were 9.464%, and on the then reproduction cost, 8.189%. For the year 1908 the cor-

rected net earnings on the then present value was 9.247%, and on the then reproduction cost, 8.029%. For the year 1907 the corrected net earnings on the then present value were 7.029%, on the then reproduction cost, 6.093%. These figures are on the rates existing in the years in question. I have not computed what the return would have been on the dollar rate but that could be very easily done. In making these calculations for 1912 the total reproduction cost and so forth, as entered on this Exhibit P, has been included. The reproduction costs and present values that I have arrived at for the years 1907 to 1911 inclusive are in view of the reproduction cost and present value of the property as at the end of 1912, and
418 are based upon the additions to the physical equipment and the going value and working capital, organization and legal expense, as shown by the inventory containing the accounts and records showing the growth in volume of business. The figures for these years do not purport to be exact as they are necessarily based upon average cost per foot of street main extensions, but it is my belief that they do represent a fair and correct total in each case. The reproduction cost of the entire property of the gas department, and the then present value are shown for each of the years in Exhibit P, as are also shown the items which make up those values. This was arrived at by the process of eliminating the equipment each year according to its age. Exhibit 7-1 shows, in my opinion and judgment, the reproduction cost and the present value of the property and business of the Lincoln Gas & Electric Light Co. from January 1, 1913. Exhibit 7-1 is offered and received in evidence.

Exhibit A, in my judgment and opinion shows the corrected proper amount to be set aside for organization and legal expense. Exhibit 7-A is offered and received in evidence.

Exhibit BB, in my judgment and opinion, shows the proper amount to be set aside as working capital for this property. Exhibit BB offered and received in evidence.

Exhibit 7-C shows, in my judgment and opinion, the correct and proper amount to be set apart in percentage for engineering and supervision, casualty liability, taxes, and loss of interest during construction, omissions, and contingencies. Exhibit 7-C offered and received in evidence.

Exhibit 7-D, in my judgment and opinion, shows the proper amount of reproduction totals for this property. Exhibit 7-D offered and received in evidence.

Exhibit 7-E showing the reproduction cost, age, assumed life, present per cent condition, present value, depreciation annuity on straight line and sinking fund basis, shows, in my judgment
419 and opinion, the proper amount to be set apart for the reproduction of the real estate and buildings. Exhibit 7-E offered and received in evidence.

Exhibit 7-E-2, consisting of four pages, in my judgment and opinion, shows correctly the reproduction cost, age, assumed life, present per cent condition, present value, depreciation annuities on straight line and sinking fund basis for the works equipment of this company, taking the equipment item by item. It does not include work-

ing capital or going value. Exhibit 7-E-2 offered and received in evidence.

Exhibit 7-E-3, under the heading of distribution system, shows, in my judgment and opinion, correctly the reproduction cost, composite age, assumed life, present per cent condition on the depreciable portion, present value, depreciation annuity on straight line and sinking fund basis, of the distribution system. All of my testimony through-t with respect to the present values of this property is as of the date of January 1, 1913, with the exceptions that I have made. Exhibit 7-E-3 offered and received in evidence.

Exhibit 7-B shows the total net construction cost correctly of the totals of real estate, buildings, works equipment, and distribution system. Exhibit 7-B offered and received in evidence.

Exhibit 7-A, under the heading of real estate, shows as nearly as I have been able to arrive at it, the net construction cost of the real estate, exclusive of improvements, with the exception that on one of the lots there is located a small cottage. Exhibit 7-A offered and received in evidence.

Exhibit 7-B and its subdivisions of 7-B-2, 7-B-3, 7-B-4, 7-B-5, 7-B-6, 7-B-7, 7-B-8, 7-B-9, and 7-B-10, shows the net construction cost of the details entering into each of the buildings where such buildings are properly classed as gas department buildings, and shows the correct amount, in my judgment. All these exhibits offered and received in evidence.

Exhibit 7-I, with the subdivisions of 7-I-2 to 7-I-73, in-
420 clusive, shows the net construction cost of the works equipment of this company in the gas department in detail as of January 1, 1913. Exhibit 7-I-, with the above-mentioned subdivisions, offered and received in evidence.

Exhibit J, consisting of the subdivisions J-4 to J-11, inclusive, shows the net construction cost of the distribution system of the gas department of this company and includes a proper and correct statement of the kind of pavement, the net construction cost of pipe under unpaved streets, the net construction cost of tearing up and replacing paving, the net construction cost and sizes and kinds, and lengths of mains, and of the services and street main drips and street main valves, and district governor, and railroad crossings, and certain miscellaneous items, and the meter stop boxes and cocks. Exhibit J, including the subdivisions J-4 to J-11, inclusive, offered and received in evidence.

Exhibit K, under the heading, reproduction expenditures and identified in my testimony as the going value calculation, correctly shows the various items entering into the exhibit, and the proper and correct calculation made with respect to those items, and the corrected and proper result of the calculation is there shown. Exhibit K, consisting of 16 pages, offered and received in evidence.

Exhibit L-1 is a correct transcript of the records of the company showing the quantities of gas made, sold, and unaccounted for, for the years 1902 to 1912, inclusive. Exhibit L-1 offered and received in evidence.

Exhibit L-2 is a correct compilation of the records of the company

showing the gross and net earnings of the gas department of the Lincoln Gas & Electric Light Co. for the years 1902 to 1912 inclusive. It does not show the allowance for depreciation as their records did not make any allowance. Exhibit L-2 offered and received in evidence.

Exhibit L-3 is a correct compilation and calculation from
421 the records of the company for the years 1903 to 1912, inclusive, of the apportionment of operating expenses to the manufacturing, distribution, collection, and executive departments and is further divided as to plant, of out-put of consumers, and of meters. All of it is taken from the records of the company except that below the word "resume", which is merely a re-statement of the figures contained in the records of the company to show another phase of the same matter. It agrees in all respects with the records of the company as of January 1, 1913. Exhibit L-3 offered and received in evidence.

Exhibit L-4 shows in detail the manufacturing department expense per thousand cubic feet of coal gas made, considering only such expenses as are properly chargeable to it for the years 1903 to 1909, inclusive, as taken by me from the records of the company. Exhibit L-5 is a blue print containing curves made under my direction from the figures shown in Exhibit L-4. It is an abstract and a correct compilation from the records of the company. Exhibits L-4 and L-5 offered and received in evidence.

Exhibit L-6 is a record of the detail costs incurred in the manufacturing department in the making of water gas for the years 1903 to 1912 inclusive. It shows the cost in per thousand cubic feet of water gas made. It was taken by me from the records of the company and is a correct compilation of those records. Exhibits L-6 and L-7 offered and received in evidence.

Exhibit L-8 is a tabulation made by me from the records of the company, showing the manufacturing department expense of the mixed gase- made, per thousand cubic feet, for the years 1903 to 1912 inclusive. It was taken from the records of the company. The accompanying blue print, Exhibit L-9, is a graphical representation of the figures on Exhibit L-8. Exhibit L-10 is a tabulation made by me from the records of the company showing the distribution department expense per thousand cubic feet of gas sold for the years 1903 to 1912 inclusive.

422 Exhibit L-11 is a graphical representation of the information shown on Exhibit L-10.

Exhibit L-12 is a tabulation made by me from the records of the company of the collection department expense per thousand cubic feet of gas sold, for the years 1903 to 1912 inclusive.

Exhibit L-13 is a graphical representation of the data contained in L-12.

Exhibit L-14 is a tabulation made by me from the records of the company showing the executive department and general expense per thousand cubic feet of gas sold, for the years 1903 to 1912, inclusive.

Exhibit L-15 is a graphical representation of the data contained in Exhibit L-14.

Exhibits L-8 to L-15 inclusive offered and received in evidence.

Exhibit M is an analysis of the gas consumption of the company for the year ending December 31, 1912, showing the average monthly consumption through-t that year for each of the 26 classes of consumers. It was made from the company's records by the secretary of the company and I believe it to be correct. Exhibit M offered and received in evidence.

Exhibit N is a statement of the quantities of gas sold outside of the city of Lincoln and of the receipts from the sale thereof for the years 1905 to 1912 inclusive. It was compiled from the records of the company by the secretary at my request and I believed it to be correct.

Exhibit O is a blue print showing graphically the growth of sales of gas from the end of the year 1872 to 1912, as shown by the records of the company, with the exception of the years 1876, 1879, 1900, and 1901. It was prepared under my direction. For the years mentioned I was unable to find any records. This Exhibit also shows the growth in the number of feet of street mains, and the growth
423 of services and meters in use by the company from the year 1903 to the end of 1912, and also shows my opinion for the last three items of what must have been the growth of those items from the end of the year 1872. Exhibit O offered and received in evidence.

Exhibit P is a statement headed corrected net earnings, prepared by me from the records of the company with the exception of certain modifications which I found should be made. These are shown in the Exhibit under the heading indicating where they are made. It also shows the deductions I have made as to the present value and the reproduction cost of the property for the years 1907 to 1912 inclusive, the latter figures being based upon my valuation of this property and business as of January 1, 1913. This also shows the corrected net earnings of the gas department in per cent of the then present value, the corrected net earnings and per cent of the then reproduction cost for each of those years, and also my deductions from the valuation placed upon the property as of date of January 1, 1913, for each of the preceding five years. Exhibit P offered and received in evidence.

Exhibit Q is a tabulation made by me showing the gas sales in thousands of cubic feet, for each of the years from 1873 to 1912, inclusive, with the exception of the years 1876, 1879, 1900, and 1901, for which no records were available. It was taken by me from the records of the company and it shows the relation both between sales of each year to the sales of 1912, and also the yearly gains in sales in per cent of the 1912 basis. Exhibit Q offered and received in evidence.

Exhibit Q-2 is the outline of my calculations showing the composite age of street mains based upon information taken from the records of the company, showing the total mains in use from the years 1903 to 1912 inclusive, and between the years of 1873 to 1903 as determined from my study of the growth in gas sales as shown on

the blue print constituting Exhibit Q-2, and the blue print referred to in Exhibit O. Exhibit Q-2 offered and received in evidence.

424 Exhibit Q-3 is the outline of my calculation showing the composite age of house services in use, as based upon the actual records of the company, showing the number in use from 1903 to 1912, inclusive, and showing my deductions from the study of the gas sales and their relation to the number of services as indicated by Exhibit O. Exhibit Q-3 offered and received in evidence.

Exhibit Q-4 is the outline of my calculation showing the composite age of meters in use as made by me from the records of the company, showing the meters in use for the years 1903 to 1912, inclusive, and from my study of the gas sales as related to the number of meters and indicated in Exhibit O. Exhibit Q-4 offered and received in evidence.

Exhibits 7-B-2, 7-B-3, 7-B-4, 7-B-5, 7-B-6, 7-B-7, 7-B-9, 7-B-10, 7-I-1, 7-I-2, 7-I-3, 7-I-6, 7-I-7, also Exhibits 23, E-28, exhibits 31, 33, 34, 54, 55, 58, J-2, J-3, all being blue prints and drawings attached to Exhibit J and identified by the witness in his testimony, are offered and received in evidence.

Cross-examination by Mr. Morning:

The gas plant which was installed by me at Peoria was a coal gas plant and I started in on the work from its inception and did not leave it until they were ready to make gas. We installed seven benches of the full depth in that plant, and the capacity of the plant was 650,000 cubic feet a day. Gas benches are the furnaces in which the retorts for the distillation of the gas from the coal are located. While I was at Madison Henry L. Doherty was general manager of the Madison Gas & Electric Light Co. He was also connected with the McMillan syndicate, and I was connected with them while I was at Peoria. From the very beginning up to the present time I have been appraising gas plants. The appraisals were made because sometimes a bank would want to know whether it should underwrite an issue of securities, or an individual desired to know whether or not he should buy a property, sometimes it was a rate case

425 before the state commission, sometimes it was a consolidation with other properties. In making an appraisal for the bank it would be thorough in the sense that all of the ground necessary would be covered, but a bank would not want to know how many brick there are in a given wall, and that detail would not be gone into.

In making valuations for a bank we got close enough to the mark if we determined the cubic contents of the buildings and then applying a reasonably close figure per cubic foot. The account of the entire system including the buildings, works equipment, and distribution system, is determined even in the most casual examination that I would make. I would determine the cubical contents and the characteristics of each of the buildings and the area of each parcel of real estate and the relative valuation of each and the size and

capacity and age of each of the works equipment, and I would determine, not only from the records of the company but from additional checks which are always available, the exact number of feet of each size and kind of street mains and whether or not under pavement, and if so, what kind of pavement. I would also determine the soil characteristics in the locality, the number, size, and average lengths of services, and whether or not under pavement, and, if so, under what kind of pavement. I would also determine the composite age of street mains and of services, the number, size, kind, composite age of meters in use and in stock, and in effect would give the same information that was given in this case with the exception that I would not go into such great detail.

The basis of the valuation is the same whether for rate purposes or for sale or condemnation or taxation. There is but one value to the property. The only difference in a rate case is that we have to have the details to prove our conclusions. In making a valuation for a bank or purchaser they want only the conclusions. They would be the same in each instance. I have made appraisals for prospective purchasers in Grand Rapids, Hancock, Mich., Hoopton, Ill.,
426 Jackson, Miss., Laurien, Mich., Maniste, Mich., Manitowoc, Wisc., Marquette, Mich., Newcastle, Ind., Red Jacket, Mich., and Shelbyville, Ind., and such sales as were made were made upon my valuation. The sale at Jackson, Miss., was consummated upon my valuation. That was a place of about 30,000 people. I don't remember a thing about it now except that I was there and did the work and it was about that size of town. I could discribe the property to you and give you a rough sketch of the plant. The purchaser was the Kelsey, Brewer Co. of Grand Rapids. Without knowing what the buyer was offering or what the seller wanted the value that I placed on this property was just half-way between those two figures and they got together on it. There is no item appearing here in this valuation that was not included in that valuation, including going value, superintendence, and engineering. I recognize only one value for a property regardless of the purpose of making the valuation.

I also made a valuation for Bacon, Olds & Co. of the properties in Anderson, Ind., Elwood, Newcastle, and three or four others. My valuation was to govern how the underwriting was to be taken over on all of these properties, by a Philadelphia bank and the money was all but paid when the banker died and the deal fell through. I made a valuation of each of the plants separately, but they were all in one report. I cannot give you the valuations but some of the properties were natural gas, some coal gas, and some water gas. I valued a property at Emporia, Kans. where the manufacturing plant was under construction and the existing distribution system was involved, and the sale was consummated. I constructed there a plant with the capacity of 165,000 feet a day, and it consisted of water gas apparatus, purifiers, holders, condensers, a scrubber, and an exhauster. That plant was under construction about four months. I designed it and the machinery was all installed under my direction. It was sold for the valuation that I placed on it. I represented both

the buyer and the seller and they left to me the valuation.
427 It would be violating a confidence if I were to tell you what the valuation was and I object to furnishing it for that reason. It was sold by one private corporation to another.

Sometime within the last two years, for the Continental & Commercial Trust & Savings Bank, I made a valuation on the property at Ottumwa. They were about to underwrite an issue of securities on the company and I made a valuation of it to advise them what it was worth. The deal was made in that case but I don't say it was on my report as I don't know what they paid. I could ascertain what valuation I placed on that plant. I do not recall it now, but I object to furnishing it to you because it would be unprofessional. The capacity of that plant was in the neighborhood of 400,000 feet per day. They had two water gas sets and either four or five benches of six'es. They also had one building containing a gas engine pressure unit beside the main building. But they did not operate an electric light plant. I do not follow these things up to find out whether the deals are consummated or not, and I presume some are consummated that I don't know about.

At another time I went to Clinton, Ia. for one of the stockholders in a company there who wanted to know whether it would be a good thing for him to secure control of the company there. He did not have the control at that time. I gave him my report showing what I thought of the property and he is now in control. What effect my report had I don't know. It is a place of about 30,000 with one gas plant. Their combined capacity, coal gas and water gas, was about 750,000 feet a day. That was some time within the last three years. I do not know what the valuation was that I made and I wouldn't tell if I did know because it is unprofessional. I am not supposed to do that. I made a valuation of the property at Freeport, Ill., where they were considering the re-organization of their company and they reorganized after I had made my report. They have since sold the property to a Philadelphia syndicate operating a large number
428 of gas plants and I was advised by one of the former owners that they sold the property at the valuation I placed on it. They had prior to that time put in a large amount of additional money in building up their plant and business without issuing any additional securities, and they wanted to re-organize, and therefore they wished this valuation.

My first experience as a witness in a rate case was in the Des Moines case which was tried in 1910 or 1911, where I was called as a witness for the gas company, and made a report something similar to the one I have made here. There they were trying to avoid the enforcement of a 90¢ rate fixed by the city council. The next case in which I appeared as a witness in court was this case. I have also appeared before the Wisconsin Railway Commission in the Sheboygan case. I was called there as a witness by the gas company. That was on complaint to the effect that the company's rates were excessive. That was a town of about twenty-five or thirty thousand people. I appeared also for the city of Buffalo in connection with the hearing before the New York Public Service Commission within the past two years. My re-

port was received there and was sworn in as evidence. I did not testify. I made the examination and report jointly with Mr. W. A. Baehr. Mr. Baehr and I did this for the city of Buffalo to determine how much the gas company could reduce its operating expenses if it adopted thoroughly modern equipment and methods throughout. There was a gas rate case on at the time but we were not concerned with that. We made a report that very considerable economies could and should be made by the gas company in the city of Buffalo, and I presume it was used in the rate case.

I am employed at the present time to make a valuation of the Spokane gas property which is owned by the same general organization that operates the local company here. There is a rate proceeding pending before the public service commission of the State of Washington, by an application to reduce rates, and I am expecting to go there from here to make the valuation. These are the
429 only two valuations which I have been employed to make for these people. At the present time I have under construction a re-building and extension of the existing plant at Excelsior Springs, Mo. Last year I outlined some plans for them to follow in the growth of their business and did some work for them and this year they have come back with an increase of business which warrants them to go ahead with the extensions. That is a water gas plant. It is a resort town and they have to provide for a peak load which is away beyond the requirements of the town itself.

I also have under construction a plant to be used jointly by Nogales, Ariz., and the town across the line in Mexico. That plant will have a capacity of 125,000 or 150,000 feet a day. They have a plant there now and this is to be an extension of it.

The valuation which I made of the real estate of the Lincoln Gas & Electric Light Co. was obtained from local real estate men. Some of them placed higher figures and some of them lower than what I have put here, and I do not pretend that that is an accurate valuation. Part of the lots in Peck's Grove addition are not now being used by the Gas Company in its gas business. I do not remember which ones. I can tell from the plat which I will produce tomorrow. The company has some additional buildings down near the plant but I have not included them in my inventory as they are not any part of the gas making plant. I think they have two or three houses down there.

I have acted as foreman on buildings but never as a contractor. However, I have been in direct and immediate charge of men doing the work, telling them whether to build the wall this way or another way, and how and when to build it. In arriving at the cost of the several buildings in my inventory I used the unit costs for the material and labor. The units varied depending upon the nature of the work. On the brick in the purifying house which was common ordinary brick I figured $17 per thousand to put the brick in the walls, which was a price of $7.50 per thousand delivered at the plant and 38¢ per thousand in the wall for the sand; 79¢ per thou-
430 sand for the cement, and 40¢ per thousand for the lime, the total for the materials being $9.07 per thousand. The time

of the brick layer was $4.16 per thousand; of the helper, $1.87 per thousand; of the carpenter, 77¢ per thousand; the miscellaneous cost of handling materials, $1.16 per thousand; total labor, $7.96 per thousand; total cost per thousand brick in the wall, $17.03 which I have put in at $17. Those prices obtain in my valuation for all brick put in at $17 per thousand. The brick in the pilasters I have put in as $21.25 per thousand because it is customary with contractors to charge 25% more for the brick actually in the pilaster than they do in the ordinary run of the wall as the cost to them is that much more to lay the brick in the pilasters. The difference is in the labor item.

In the same building I have put in the actual brick in the cornices at the same rate, $21.25, for the actual work there, and they are figured at the same rate as the pilasters because of the extra labor. In the pilasters of the purifying house there are 4,452 brick, and in the cornices, 5,860 brick. Those are all of the modifications in the brick-work of the purifying house, and the other buildings I treated the same way. In addition there is some little brick-work in the foundation in which I think I have used $20 per thousand because of the small amount of brick. It would be a negligible quantity. I did not try to separate the different kinds of lumber. I took an average price for all of the lumber which was $42 per thousand in place. I figured it delivered at the works at $26, $27, and $28, and I know that is what it would actually cost there. I have taken the average figure of $42 to put it in place as I found that it is not worth while to go to the details while getting the unit of each particular piece of lumber in the building. It is a small amount in the aggregate after you get it and $42 as an average cost I believe works out equally as well and I feel perfectly safe in saying that all of the lumber in that gas plant will average $42 a thousand in
431 place. The average labor included in that $42 is the difference between $26, $27, and $28. Some of the steel work in the purifying house I put in at 5¢ per pound in place. The steel delivered on the ground would cost about 3½ or 4¢. That steel is framing for the floors. There is also some cast iron in the same floor on which I used 4¢ per pound in place. The iron alone would cost about 3¢. The same unit was used on the steel and iron in the other buildings.

In estimating the value of the gas holders I determined the quantities as nearly as possible and the excavations and made an estimate from those items. On the re-enforcing steel I estimated 4¢ per pound in place. 3½¢ of that is for the steel alone. The balance is for labor. That steel is used in the concrete foundation. There again in the foundation of the holder I have some brick in at $17 per thousand and concrete at $5 a yard which includes the labor and the materiai, and covers the same kind of brick as used in the building. I have taken all the brick at the low price.

The cost of the steel in the holder depends very largely upon the size of the holder. The fabrication of this steel is nearly all done in the shop and when you buy steel for a gas holder you do not buy so many pounds of steel, but so many pounds of gas holder. Every

sheet of it is all accurately cut and finished so when it comes here it goes together like the spokes of a wheel. The steel in the holder in East Lincoln I have in place at 6¢ per pound. There were a total of 136,600 pounds in that holder. The actual erection of this steel is figured at 12¢ per pound. For the other items in this holder I have figured the excavation at 75¢ a yard, the re-enforcing steel at 4¢ per pound, the concrete at $5 a yard, the brick at $17 per thousand, the dressed stone at $47.25 a cubic yard, the cement plaster on the brick and concrete at 2¢ a square foot, back filling and removal of surplus at 25¢ a yard, water at $1.50 per thousand cubic feet. The cost of the masonry tank which includes all the items in the entire cost of the holder except the water in the tank and the steel
432 and iron in the holder proper and the guide fram- and the inlet and outlet connections, is $2,281. This covers the excavation and forms required in concrete work and re-enforcing steel for the concrete itself and for the brick and dressed stone and plaster on the brick and concrete, and the back filling and removal of surplus material. The holder complete cost $18,685. The water costs $148. The connections and miscellaneous are 12,000 pounds figured at 6¢ per pound. These are cast iron and on work like this where the major portion of the cost is labor it will run to 6¢. It includes the belt and spigot pipe.

I tried to find what this gas holder actually cost the company when it was constructed but I was unable to do so as it was covered by a good many vouchers. The masonry tank is considerable more than half of the total cost which is frequently the case. This total cost of some $18,000 does not include the booster. Its particular function there is to take the gas from this holder and push it out at a little higher pressure to the outlying districts. It is used in connection with the University Place and Havelock extension service. I consider my estimate of the cost of the masonry tank to be the fair and reasonable cost of building it new. There is at the East Lincoln holder a number 5 Sturdevant blower belted and its net construction cost including the foundation is $180; another number 5 Sturdevant blower, geared, with net construction cost of $210. Their purpose is to increase the pressure at all outlying points and it is necessary to have two of them in order that one may be held in reserve for emergency and also that both may be operated to take care of the peak load at times. These blowers are treated in this valuation as independent items and include the installation of each and connecting them up with the distribution system ready to use.

I estimated the gas connections at the East Lincoln holder of the company to be approximately 24 feet in length as the tank is shown to be 22.9 feet deep at its maximum depth and 7 feet at the minimum depth, and it is the general practice that the diameter is 12
433 inches, but I did not see the holder built and thus cannot give it to- as it is from knowledge. I don't even know that there are any connections to that holder but I observed that the gas goes in and comes out and that it goes up and down and I suppose it must be with connections. There is a standard practice in the designing of holders of given size and unless some person makes a

special request for an off-size they get a given size which is either a 10-inch or a 12-inch one. I suppose that I took the 12-inch because that is what would be ordinarily taken. It is the customary thing to include these connections in the steel contract. I did not ask for the contract because I did not care what the actual cost was. I can come close enough to the actual cost of a holder without knowing the contract cost.

If there was a contract showing the cost under the valuation which I have given in the report I would think that there were additional items not shown in the contract. I figure that my actual experience is better than some method of bookkeeping in arriving at the cost of the holder. If you can show records which will satisfy me that they are complete and cover everything in question then you have got some very good evidence as to the cost of the holder and you have something which bears materially upon the reproduction cost as the construction was completed within the last few years, and if the construction was finished recently enough and if all of the details were there I would adopt and very gladly accept that evidence as an indication of the reconstruction cost, but I have yet to see the first gas company that so keeps its construction records to show accurately the construction cost of a given piece of equipment. The records are not designed for that purpose and they are not so kept in any plant that I have ever seen. I found that the system of keeping the records here was the same as used in a great many other places with which I am quite familiar and I know that neither I nor anyone else can find from that record the actual cost of any piece of equipment, therefore I did not ask for it, with the exception of such little
434 items as the pump or some little piece of equipment that is made up separately. I know that you cannot go into the records of this gas company and determine what the last water gas holder cost. Before proceeding with my valuation I made sure that the bookkeeping was of the kind ordinarily met. I did make an investigation of the actual cost of several of the large items just to make sure that my position was sound, and I found it was. That was that the actual cost of the items could not be determined from the records. I ran through several hundred vouchers covering a period of four or five years altogether in an effort to find what the actual cost was of several important items.

The purpose of the bookkeeping of the gas company is not to determine the actual cost of these items in the inventory. It is of no service to the gas company to know that. It is all right to know the total construction expense. With respect to the district holder I found that the steel work was done under contract and it was also apparent that some of the other work was done under contract. I examined the vouchers and added up the total of all that I thought were concerned with this work but they did not agree with my valuation because work that is supposed to go against a water gas machine, for instance, frequently concerns a lot of items that go to other places, and the man who makes the apportionment of the time cannot always keep it exactly straight and sometimes there are important items that

actually went into the gas holder that are charged up in the records against the water gas set.

It is a very ordinary thing to find that materials meant for one piece of work are used in another because it happened to be convenient at the time the man was putting the work in. If the masonry tank in this district holder was constructed by contract and the steel and super-structure by another contract the sum of these two contracts would not give the total cost of the gas holder unless you had some evidence that those two contracts covered all of the cost
435 involved. I did not ask for the contract on the 500,000 foot holder at the plant which was built five years ago.

In making my estimate of the cost of that holder I took my knowledge of what other gas holders had cost other companies, plus what I could find out here as to local conditions and local prices. I do not believe the records of the company will show what the holder actually cost. I think it was built by the Stacey company of Cincinnati. The 500,000 foot holder has a steel tank and must stand a greater pressure than the 100,000 foot holder. It has a concrete foundation with reenforcing steel. The steel tank containing the water has a concrete pan above ground for a foundation and then the holder is floated in this water. I do not know what the actual cost of the foundation for the large holder was but I found that it had been built by contract. I do not know who was the contractor and made no effort to find out.

If you will tell me what is covered in your contract I can tell you whether or not it covers the items I have shown in my inventory and valuation. The concrete pan for the large holder costs $5,709. The tank connections I found were 10,000 pounds at a price of 5½¢ per pound in place. These connections consist of inlet and outlet pipes. The miscellaneous connections are included in the valuation of the tanks and I have not shown them separately in the East Lincoln holder. I included the miscellaneous items with my connections. I just happened to work it out that way. These miscellaneous items outside the connections proper are foundation bolts and should be included in the contract price of the superstructure. The reenforcing flanges where the contract for the foundation was let to one contractor and the steel super-structure to another would not be included in either contract as they are miscellaneous items. The gas company ordinarily has to do those things themselves with the exception of the foundation bolts which are nearly always furnished by the contractor for the steel work. The flanges which I speak of are used where you have a relatively long piece of pipe standing
436 vertically and you wish to steady it, and you put the reenforcing collar around the pipe sometimes, and other times you put in guy lines and these are the flanges. The steel above the foundation for the large holder I estimate at 400,552 pounds at 5½¢ per pound in place.

I did not estimate the labor and steel separately but the labor would be about the same as I gave before, but I have not gone that far because of the shop work. The steel work and iron work in place amounts to $37,980; the foundation, $5,709; and the water, $296. That is the cost of putting the water in the holder and it is part of the

reproduction cost of the holder. In order to put it there you have to have a considerable bit of extra labor and have to rig up a pump and you must have a man there to watch it very often. It takes 197,267 cubic feet to fill this holder with water. I figured the water at $1.50 per thousand cubic feet which includes the average price for water and the cost of putting it in the tank. You have to have at least one man there all the time and you very commonly have to get pumps and even if you don't need pumps it will cost you $1.50. The $1.50 per thousand cubic feet figures something less than 18¢ a thousand gallons. It is necessary for the man to stay there while it is being filled to see that it doesn't explode. The contractor may also have a man there to turn the water on and off but that would not be satisfactory to the gas company. It would be a very poorly managed gas company that would allow someone to do that without supervision. The net construction cost of this large holder is $43,985, which includes everything. On the excavating on this holder I figured $1 per yard and for back filling and removing surplus material, 50¢ a yard. On the East Lincoln holder I figured 75¢ and 25¢ for these items. I used a different figure on the two holders because there is very much more excavating on the smaller holder. The smaller holder is built down into the ground while the larger is on the ground. The 200,000 foot holder at the plant was
437 built 25 years ago, has two lifts and a brick tank with a concrete bottom. The tank is below the ground. The tank I have estimated would cost $10,409, which includes excavating, brick, concrete, dressed stone, plaster on brick and concrete, back filling, and removing the surplus material, but does not include connections. For the excavating I figured 75¢ a yard, and for the back filling, 25¢ a yard. I figured $17 a thousand for the brick in place, and $5 a yard for the concrete. The total excavating was $4,237; the brick, $3,261; the concrete $870; dressed stone, $421; plaster on brick, $114; plaster on concrete, $94; back filling and removing the surplus material, $1,412. On the super-structure, knowing the pressure that is thrown by the holder I calculated its exact weight, by its diameter, as 242,650 pounds for the steel and iron which I have estimated at 6¢ a pound in place.

I have not attempted to segg*r*egate the shop from the balance of the labor. The most expensive part of the labor is done at the shop after the metal is purchased. That weight includes the guides and frame work. All of the weights of the steel and iron in the holder I have calculated myself from the diameter, weights, and pressure thrown. All of the quantities of excavation and the steel in the foundation and the concrete and the plaster and water has been furnished by Mr. Brodnax and his assistants. The lifts in this last holder weigh 137,150 pounds. I secured the other weights involved from the knowledge of what those weights run on gas holders built in many parts of the country by various builders. They are not necessarily the actual weight except that they are standard constructions of gas holders each manufacturer having a standard holder which he builds and he always tries to get to that same standard in all respects because his cost is lower that way, and I think that they succeeded in doing

so in this case. I have seen this holder and I knew who built it, but I have forgotten now. I did not try to find the contract price for this holder nor could I had I tried so far as I know. There is another holder of 50,000 capacity at the plant built 31 years
438 ago and I presume it was built by contract. It is a single lift gas holder with a brick tank. I do not know what it cost when built. It is a holder that would be built by an up-to-date company at the present time only it is small. The footings and the tank itself are made out of concrete, the walls of the tank being brick, and the super-structure is steel. The foundation which includes the tank and everything except the water, steel, and iron, I figure to cost $6,850, figuring the excavation cost at 75¢ a yard, the removal of surplus material and back filling at 25¢, the brick work at $17.00 a thousand, and the concrete at $5 a yard. There is a total of 58,234 pounds of steel and iron which I figure at 6¢ a pound in place. The same condition exists there as to the lab[illegible]r as did on the others. The lift weighs 33,264 pounds and the balance of the steel and iron weighs 24,960 pounds. The connections are included in the total steel and iron weights.

The measurements for the buildings were furnished to me by the company and were made by Mr. Brodnax and his assistants. I made three visits to the plant to look the buildings over prior to my valuation. I did not make any measurements. I went down there with the purpose of satisfying myself that the inventory provided me was substantially correct. I checked it up both on the buildings and distribution system as far as I could to satisfy myself. I did not go down there to see if they had given me the correct number of feet of lumber, the number of brick, amount of iron and concrete, and I have assumed in my figures that those details were correctly given. As to the depth of the foundations under the brick walls, I made some inquiry but I didn't dig up any of the foundation and I also inquired as to what troubles they might have had in the foundation work. The measurements of the foundations were made on a plan which I outlined to Mr. Brodnax. We had worked together before and he knows what information I wanted. We went over in
439 a general way before he began to take any of his measurements and when the matter came back it was in the form I expected and I have every reason to believe that it is correct. I fixed the age of the purifying house at 22 years which was based upon information which Mr. Brodnax and his assistants secured through local inquiry and looking over the available records as to dates of buildings and works equipment throughout.

There is a full basement in that building—more than an ordinary basement. It is 11 feet from the floor of the basement to the underside of the next floor above. The floor is of concrete and wood. The operating floor is wood. The floor of the purifying house is 8-inch concrete, and covers the entire basement. That basement was used for the re-vivifying of oxide. The oxide when exposed to the gas combines with some of the sulphur compounds in the gas and when exposed to the atmosphere in the process of re-vivifying combines with the oxygen and releases the sulphur, forming oxide which we

started with. Then the mixture can be placed back into the purifying boxes and used over again. The operating floor is where the men walk around the boxes while filling them. The boxes are on cast iron columns going up through the basement. The columns are steel beams and on top of these beams rest the bozes or purifiers. There is no story in this building above the basement and first floor except part way up to the boxes in this operating floor where the men walk around. These boxes are used to purify both kinds of gas. The inner walls of the building are 13-inch and the outer walls are 17-inch.

I do not know what this building actually cost the company when constructed and made no effort to find out. In figuring the cost of brick I obtained the local prices I used here. The local prices varied some. I inquired for the present prices and found the usual range that you would get in any town on building material. The dealers are very seldom together. I figured the brick at $7.50 delivered at the works, and I found that I could buy brick here at prices
440 higher and lower than that depending upon the brick. The brick used in the construction of this building is not as cheap as some brick but it is not fancy brick. The price was secured from the average cost in many parts of the country as applied to the local prices. I secured local prices on the lime and sand and all of those things. Sometimes I took the actual figures given me and sometimes the figures between them.

The next house in my inventory is the generator house which is used for the water gas generation. There are two water gas sets in that house and are in actual operation. Ordinarily a water gas set consists of the generator, the carburetor, the super-heater, scrubber, washer, wash boxes, condensor, blowing plant, with the miscellaneous gages, pyrometer. That last measures the temperature. Some contractors also include steam meter and air meter. Exhibit 7-B-3 is a drawing showing the generator house plant. The gas generators in this house are located on the ground floor but are operated principally from the second floor. This building is used altogether in connection with the manufacture of gas.

The next building in my inventory is the retort house which is used to protect the coal gas benches and the men who operate them when they are in use. That is where the coal gas is made. The retorts are built on the ground floor and are of brick. They are what we call the benches. This company has not made coal gas for three years and I do not think this building has been used during that time except for a storeroom. The same unit prices were used in estimating the cost of this building. The retort house or coal gas house is an essential part of the system at the present time because the price of oil has made jumps during the past year that were never dreamed of before, and has only been guarded against by cautious management by taking a long shot in assuming that such a thing might happen and now it has actually happened. The price of oil is increasing by leaps and bounds and nobody knows where it is
441 going and as a protection the coal gas equipment is very valuable. It is an emergency plant for I expect to see them mak-

ing coal gas again before very long in this plant, as when the oil gets up to a certain point it will be cheaper to make coal gas. When the oil goes down again it will be cheaper to make water gas. The fact that the company has a combination plant enables it to buy oil at much lower prices than they could buy it if they had no coal gas equipment. This applies not only to the building but the coal gas apparatus itself.

The six benches independent of the piping have a net construction value of $17,993. In addition to the building and the benches there is the operating floor. In speaking of coal gas apparatus I include these benches and probably the charging floor in the retort house. That is the floor which the men use when they throw the coal into the retorts. If the retorts are thrown out as being of no value then we would have to build and erect this floor. It would have to be added to. The present value of the six benches of sixes is $16,280; of the retort house, $6,511. There is nothing else in the entire equipment of this plant that could not and would not be used for water gas.

Lots 1 to 15, in block 2, Peck's Grove addition, are used for the district holder. The entire group is the district holder site. The entire group is given over to the district holder station and you have to provide for extensions in the future when you erect such a station. I am unable to say just how many are needed at the present time. The lots 1 to 15 in block 7 are directly across the street from the first group. These lots were purchased because of threatened damage suits. They were really a part of the cost of putting up the holder out there. I visited this property the first time I was out here. On the second group there are no buildings. The next piece of real estate, the south 92 feet of the east half of lot 11 in block 77, is located across the street west from the works. The company is holding this property for the purpose of erecting barns and additional
442 buildings this coming summer. It is not used by the gas company at the present time. The next piece of property is the west half of lot 11 in block 77 and it adjoins the last mentioned lot and it is not used by the company at the present time. It is in the same condition as the first piece. In the valuation of neither of these two pieces are any buildings included. The east half of lot 12 in block 77 is in the same condition as the last two preceding ones.

Lots 1 to 12 in block 79 I have valued at $11,000. On this property is located the company's electric light plant to the extent of about 20%. Some measurements were made and we found that the ground actually used by the electric department represented about 20% of the whole. I am unable to give the measurements. They gave me a plan of the works and I was able to tell from that. The next piece of property, the south 20 feet and the west 16 feet of lot 2, block 32, Havelock, was acquired from the old Havelock gas company, and is not now in use. That was acquired when the existing company bought out the Havelock company. They had at that time an acetylene plant out there. It is not used at the present time and if it were it would be exclusively in connection with the Havelock service. The same answer applies to lots 18 and 19 in block 17 in Havelock. I

understand that it is vacant property. The apportionment of the real estate between the gas and electric department is as follows: lots 1 to 15, block 2, and lots 1 to 15, block 7, 100% to the gas department; the property in blocks 77 and 79 in Lincoln, 80% to the gas department; the property in blocks 32 and 17, Havelock, 100% to the gas department. The 80% assignment is based upon the assumption that the gas buildings occupy 80% of the ground space and has no reference to the relative income of the two departments. The same method of apportionment is followed on operating expenses but there are not many operating expenses that are common to the two departments. I went through all of the items
and made a study of each item. They include taxes,
443 some of the general office expenses, and salaries, office
rent, insurance, and legal expenses. They have all been subdivided on what I believe to be the most fair apportionment. Some of them I apportioned 80%, and some of them 66 2/3%, whatever I believed to be fair. The property in Peck's Grove was purchased at about the time the East Lincoln holder was erected, and was in connection with that project.

The amount of water used to fill each holder is shown on the sixth and following pages of Exhibit I. In the East Lincoln holder I figure $148 for water; in the 500,000 foot holder, $296; in the 200,000 foot holder, $150. I understand that these holders are filled by a service pipe from the city water mains. It is measured through a meter I think, but whether it is or not is immaterial. The cost of putting the water there is part of the cost of reproducing this plant. The purpose of my investigation was to determine the reproduction value of this property. Operating expenses are diverse from reproduction expenses. In the first place you have got to get water into that tank. If you have got everything equipped and have the plant ready to operate, before you can begin to make gas and use this holder you must fill this tank. After you have once commenced and it has been filled once the additional water required for that holder is an operating expense. I do not figure any depreciation on that water. It loses some by evaporation but the rains make that up. You don't have to put the water in but once. It is like the brick you put in your well. That is not true of an item like coal. They have installed two gas meters down there and I have included them both in my valuation. As long as they are not making coal gas they do not use one of them. However there is no such thing as a coal gas meter. They have two meters there not because they are making coal gas or water gas but because they need two meters, one for use in emergency. Either gas can be measured through either meter as now connected. The 10-foot McDonald station meter used in connection
with both kinds of gas is installed at the end of the purifying
444 room called the meter room. I do not think both kinds of
gases can be measured at the same time through the same meter but I understand that both of these meters are so connected that either kind of gas can be measured through either one of them. I did not ascertain whether they were both measuring water gas on January 1st or not. They were both necessary. In order to get an

economical operation of your plant you must measure the coal gas separately and you might want to manufacture coal gas. As long as they are making water gas exclusively I would want both of them and I might use them both at the same time to keep them in operation. The small meter would not be quite large enough at all times. When they were making both kinds of gases one was used to measure one kind and one to measure the other kind, and I presume the small one was used for coal gas. There is no third meter there for measuring the mixed gas, and I presume that one of these meters really measured the mixed gas and the other the straight gas, and the volume of the other straight gas is obtained by subtraction. The net construction cost of the 10-foot meter including foundation is $3,901. The net construction cost of the 6-foot meter with the foundation is $1,358. The foundation in the 10-foot station meter is $66. The balance is for the meter proper. The foundation for the 6-foot meter is $58. The net construction cost of the 6 benches of six'es complete with foundations is $17,993. The cost of the foundation was $1,193, which does not include the arches. I did not value the arches separately as that is not the way prices are made on benches. I have not figured out the arches and settings and iron work on these benches separately but I could do it though it would take the rest of the day. $2,800 is the cost of each bench, which includes the benches complete without foundation. These benches are constructed by contract, ordinarily. I have not stopped to figure out what the iron work for one of these benches delivered in Lincoln would cost.

445 I presume the builders bought the brick and tile in special shapes at St. Louis. While I was operating properties I took special work in the University of Wisconsin, the Louis Institute of Technicology, Armour's Institute of Technicology at Chicago, and Northwestern University at Evanston. I was three years at Madison, then went to Peoria for a year and then to Fond du Lac, Wisconsin for a few months and then went to the Western Gas and Construction Co. in the fall of 1901 or the spring of 1902, and stayed with them for a year and a half or two years. None of the apparatus at this plant was installed by the Western Gas and Construction Company while I was with them that I remember of. In calculating the cost of reproducing these buildings I assumed that the purifying house, retort house, coal shed, oxide shed, stable and blacksmith shop would be erected the first year and not separately, and this assumption enters into the calculation of the going value. Also if you were going to build this a little bit at a time the cost would be much higher than I have it here. If the company was going to build all of these buildings at once it could get the material in large quantities and by letting the contract for the entire work they could get a better price than by building each building separately, and I took that into account in my valuation. For instance, on the brick I have figured $7.50 a thousand straight through and it would be that if you were going to build it all at once. The two 7-foot, 6-inch water gas sets in Exhibit I were both installed by the Western Gas and Construction Co. I made no effort to ascertain what the contract price was. I did work through the vouchers as I have already explained but these

vouchers don't show all the cost. The Western Gas and Construction Co. frequently makes detailed statements with each contract but I did not need that here because I saw the equipment. I could see what they had and I did not care what they had bought. I have often made repeated attempts to find what the actual cost of
446 items was from the records but have always found it impossible. I presume that there are seasons in the year when they do use both of these sets, however not at the same instant. The process of making water gas is intermittent. You first have got to blow up your fire. We call that the blasting period in which air is carried through the fire, resulting in what is called producer gas. That is carried forward into the carburetor and down over the superheater, and out into the air through the stack valve. They have got a secondary air that burns all the combustible portions of the gas that have been left in the generator. When this air reaches the stack valve in normal operation there is no combustible property left. Having brought the various parts up to the required temperature the stack valve is shut off and steam admitted below the grate. That steam is decomposed and then combines with the carbon, forming carbon-dioxide, and hydrogen gas. The carbon-dioxide forms at the bottom of the fire and on going up through the fuel bed takes up additional carbon. Each molecule of steam will take up an additional volume of carbon-monoxide so that at the top of the fire you have practically equal volumes of carbon-monoxide and hydrogen. These both burn with a blue flame and have relatively low thermal values, and to make it of commercial value oil must be introduced. This is done in the form of a spray and the oil is broken up into hydrocarbon gases and these are mechanically mixed with the blue gases from the generator. This whole operation takes but a few minutes, four to seven minutes depending on the local conditions, and the period of blasting takes from one to three and a half minutes, and in that way while one set is blasting the other can be making gas. But this would only be done in cases of emergency. It is not the best way of operating the set. Ordinarily one machine is down for a day or two while the other is in operation, and because of the alternating scheme it is possible to use two generators with only one
447 scrubber and condensor. Also one is used in the sense of a reserve for the other. It happens very frequently in water gas sets that one set will need repairs. The two 7-foot, 6-inch water gas sets are practically identical. The foundation in each I figured to cost $277, which would make the foundation ready for the receiving of the gas sets. They are always installed by contract exclusively of the foundations and the contract price normally includes the erection on the foundation. The owner in addition to building the foundation also builds all the small pipe lines within a certain distance of the shells and then the contractor installs the machinery and connects it up. The water gas sets including the foundations I have valued at $8,200 each, in place. The 6-foot, 6-inch water gas set found on the second page of Exhibit 7-I-6 is 12 years old and is located in the retort house. It is connected with the plant and ready to use but I do not believe they are using it. It is not as economical

a machine as the new ones. At the time it was bought the design of water gas sets was relatively crude and they are making better machines now, and you can't afford to run those old machines except for emergencies. It is cheaper to get a new machine. I figured the reproduction cost of this machine at $9,364, and its present value at $6,648. In getting this present value I do consider its obsolescence. The present per cent condition is 71 which I secured by reference to the tables. The machine is 12 years old and has a life of 30 years. The 71% represents the average of all three factors, obsolescence, inadequacy, and physical decay. When passing upon the value of the machine it is impossible to say which of the three is going to be the controlling factor. The same process is used on a new machine. When these new machines arrive at the same age as this one the same per cent condition would apply. I know of one concern now that wants to buy this particular machine. I haven't asked the price but there is no trouble in selling it. I have figured the foun-
448 dation here at $222. The balance of the reproduction price of $8,072 is for the machine in place upon the foundation. I do not know what it did actually cost the company. It is not in actual use but is held as a reserve unit and has not been used very recently. Either one of the larger sets is of sufficient capacity to make the necessary output for this plant but they both might easily be out of condition at the same time. Also the output is increasing rapidly. It is extremely inadvisable to try to run a plant with one set and a plant cannot be run with two sets unless the sent-out remains stationary. The next set is the 6-foot, 6-inch springer water gas set. It is 22 years old. The type is not being manufactured at the present time and this piece is pretty seriously affected by obsolescence. The reproduction value of this set is $5,790. Its present value is $2,200. The market value can be secured as any manufacturer will make one if you want it. I arrived at the value by determining the size and character of the machine, the quantities, and the foundation and applying the present cost of materials in the equipment. The foundation figured $191, and the balance is for the set placed upon the foundation. The present per cent condition of this springer set is 38, and it is worth 38% of its new cost. It is worth that much to this company as a reserve unit. The crippling of either one of the 7-foot, 6-inch station sets might easily make it necessary to operate both the 6-foot, 6-inch set and this springer set, while one of the 6-foot, 6-inch sets might make all the send-out necessary, but no water gas machine can operate continuously. If I were rebuilding this plant of my own design I would have none of these sets. I could determine how many sets I would install but I would not want to do it off-hand. I am not sure whether or not this springer set is connected up and in place. It has been a good while since it has been used. The Sturdevant blower, identified in my Exhibit 7-I-9, is located in the manufacturing plant. I have figured the foundation of this blower at $12, and the total cost at
449 $272. On the Sturdevent blower, identified as Exhibit 7-I-10, I have figured the foundation at $19, and the total cost at $279. Either one of these blowers might be used in connec-

tion with either of the gas sets. They are both useful. The blower identified as Exhibit 7-I-11, valued at $273, wood foundation, I believe is in the condensing room and it is used in connection with the coal gas, and I believe it is out of commission at the present time. The foundation on this one I figured at $53. The next item, the number 8 Sturdevant turbo blower, is located in a room adjoining the water gas room and is used in connection with the two large water gas sets. The total cost I have figured at $435, of which $67 is for the foundation. The next item is the number 8 Sturdevant blower entered at a valuation of $453. It is located in the meter shop in what is called the booster house. It is used to increase the supply of gas at times when the pressure of the holder alone will not deliver enough to the mains. It is useful and in actual use. $83 of this valuation is for its foundation. I secured the information as to their age from Mr. Brodnax. Exhibit 7-I-15, being the number 6 Sturdevant exhauster, is in the purifying house and is used in revivifying oxide while it is in place, and to take the gas from the relief holder and send it on through the purifiers into the storage room. I have entered it at a valuation of $346. It is five years old. The next item is the number 10 McKenzie exhauster, identified as Exhibit 7-I-16. I have entered it at a valuation of $440. I do not remember just what it is used for but as far as I know it is connected up and I consider it a useful thing. The exhauster is a machine to draw the gas from one place and push it on to some other place,—a kind of pump. The 4 x 5 Greenfield vertical steam engine is used in connection with one of the exhausters or blowers at the plant. My valuation of that is based upon the tables of costs of engines. This engine is 15 years old and its life is 20 years. The present per cent condition I
450 figured at 35. The amount of depreciation on that engine would be the difference between the reproduction value and the present value. The number 5 x 5 Sturdevant vertical steam engine, identified as Exhibit 7-I-18, operates one of the blowers and exhausters in the works. I think all of the exhausters are operated by steam. For the next item, the 7 x 6 Sturdevant steam engine, of the amount of valuation I have placed upon it, $47 is for the foundation and the balance for the engine in place on the foundation. It is also probably used to operate one of the blowers or some similar work, and it is actually used or useful in this plant. The item covered by Exhibit 7-I-20, a 40-horse power General Electric motor, is 7 years old and was purchased from the General Electric Co. I presume. I did not attempt to find out what had been paid for it except as I have heretofore stated. It is used in place of one of these engines or one of the small pieces of work. I cannot tell you exactly. I do not find any substantial equipment used by this company in the inventory of its plant that I do not consider useful or used, and it was distinctly understood that property that was neither useful nor used was not to be considered. I found none of this character unless there was some scrap iron round the plant which was some old junk. I do not remember of excluding any items of machinery and everything that I found in the plant with the exception I mentioned I considered useful or used. The 35-horse power Fort Wayne motor cov-

ered by Exhibit 7-I-21 is 10 years old. I do not remember what its exact location is nor whether it is in actual operation at the present time but I do know that it is useful to the company for it can be placed in service and is useful without being connected up. The fact that the company has any of this machinery in its plant and in readiness to use is evidence that it is a dependable unit in a plant which must run 24 hours every day in the year, and is evidence that
451 it is used or useful. $40 of the total cost is for the foundation and the balance is for the motor in place. On 7-I-25 the foundation cost is $41. On 7-I-26 it is $51. On 7-I-27, the foundation cost is $71. The scrubber, covered by this exhibit, is of a very efficient type that is used today, but whether or not I would put it in there now is a question. It is usually used on coal gas for the extraction of tar vapors and ammonia from the gases, but it can be used on every kind of gas. I would not design it for a water gas plant alone. But in that case I would use an immersion washer. This scrubber is located in the condensing room on the second floor. I don't think they use it for water gas now.

The items in the foundation for the purifying boxes, 7-I-28, are cast iron, $108, steel, $980, footings, $200. Above the foundation those boxes consist of cast iron columns and steel I-beams. They are just a big cast iron box 24 x 24 x 4 inside, four in number. Around the upper edge of the sides is what we call a seal, being 8 inches of additional portion of cast iron brought out from the side so you can have an annulus in which water is carried, and you place an inverted steel cup usually with a flat top and the sides go down into the seal. It is arranged so that it is easy to remove it and it can be lifted off one box and set over on another box when the men want to get into the box to throw out old material and put in new. The material consists of iron ground up. Sometimes they are filings. When it gets so it cannot be used any more it is revivified. These boxes are installed in the building called the purifying house. If I were building this plant today I would want some protection for them because you can't purify gas economically or efficiently unless your temperatures are maintained at a certain point and in the boxes themselves the flow of gas is not always constant, and even if the temperature is constant outside there are variations in the boxes, and it is necessary to reduce the variation to a minimum which can be done by putting a house over them. They are built out of doors in
452 the south where the weather will permit. They have the boxes built outside in Racine, Wisc., I think, and also in Springfield, Ill., but that does not indicate anything as I would not build purifiers in Lincoln outside. In my judgment there must be a protection here. For determining whether I would in re-building this plant, install as expensive a type of boxes I would require some time for calculations. This type of boxes are as modern and efficient as any. There are some plants that are installing the same kind now and larger, and in other plants boxes that were not in use 20 years ago are now being used considerably. These boxes appear as being 11 years old. I do not know what kind the company had before that. If they are older than that they are not so valuable now. There

might be a cheaper type of boxes that would serve this plant in this location as well as those installed here but I made no such calculations. The company here would furnish the foundation for these boxes and then the boxes would be built by some contracting company. I have no information as to what these boxes actually cost the company. I arrived at the net construction cost of these boxes by applying my knowledge of the usual cost and selling price, for similar boxes in other places and through a knowledge of local conditions and costs. I have been connected with a company that actually manufactured and sold these things but I cannot give you the unit price as I don't do business that way. It would have to be figured out. I have also data of the actual cost of boxes installed in other cities which I got from my experience both in preparing detailed estimates as well as closing contracts for these boxes. The foundation for the item covered by Exhibit 7-I-29, cost $66, and the balance of the valuation is for the meter in place. That meter is 11 years old. The Hinman drum is of a later construction than the shell of the meter. I did not put a valuation on the drum separately as they are not sold that way. They are sold complete as I have given the figures here. The drum is that portion which revolves within
453 the shell of the meter. It is of a metal construction something like a windmill with the fan partially enclosed so that the gas in going from one connection passes under the connection and as the flow is increased it pushes it up until the gas escapes to the next, and so on. I do not know when that drum was put on this meter or what it cost the company when it was done. The fact that it is a Hinman drum indicates a capacity greater than the ordinary drum. The item covered by Exhibit 7-I-30 is 30 years old and has a life of 40 years. There is no foundation for this meter. It is carried by the floor. I do not know whether it is in actual use at the present time or not. It was probably used for the coal gas, and is useful in that it is probable that the company will make coal gas again very soon, and then they will need a second meter, but whether they embark in the manufacture of coal gas or not it is probable that their send-out will increase to a point where the present large meter cannot handle the business alone. If the output gets too large they can then run part of the gas through one meter and part through the other and make 100% use of them. Normally the capacity for the large 10-foot meter with the Hinman drum is 1,200,000 to 1,400,000 cubic feet a day but the capacity of a gas meter must be sufficient to take the maximum load per minute. If I were to install a new meter for this plant I would have to determine first the actual peak load demands for a considerable period of time and I believe I would install this meter that is there now. The capacity of a meter must be sufficient to take care of the peak load, and that capacity must be determined by careful calculations. The large meter now in the plant is obviously able to take care of the present peak load. The station meter is located between the relief holder and the storage holder and if you have sufficient capacity in the storage holder to take care of the momentary peaks you can have a smaller meter, but the station meter must be large enough to permit sufficient gas to go into the storage holder

to supply the ordinary consumption. You can be running
454 your meter at full speed and while the meter is running the gas producers need not be working. There is a margin between the capacity of this plant and its present requirements. I can determine that by some calculations but I have not prepared those figures and I cannot do it off-hand. The governor covered by Exhibit 7-I-35 is located at the plant, is known as a station governor, and its function is to maintain a uniform pressure on the gas leaving the plant. Such an appliance is necessary in all gas plants except those called high-pressure plants, and there they have the equivalent by having individual governors on the services. The age of this governor I have assi-ned as 21 years, which was determined from inquiries made by Mr. Brodnax and his assistants. Its life is 50 years. Governors as a rule are sold separate. $840 is the net construction cost of this governor with its foundation. I believe this governor is resting on the floor. It would cost about $40 to install it which would make it cost $800, F. O. B., Lincoln. The governor covered by Exhibit 7-I-36, has the same function as the preceding item and is on another main from the holder. The 20-inch on the first governor and the 12-inch on the second governor signifies the size of pipe leading from the storage holder on which the governors are placed. The Reynolds station governor is 4 years old and the net construction cost which I gave it includes the cost of the governor plus the freight and labor of installing it. The labor item was $15 and the freight and handling was $40 from Anderson, Ind., which leaves the net cost at Anderson, Ind., $360 for that governor. The item covered by Exhibit 7-I-37, the Knowles compound pump, I do not remember what its particular function is as I am unable to recollect the piping arrangement. It is used, however, or is useful, as it is connected up and ready to be used. That pump is ten years old. My information was secured from the same source as the ages of other items. I estimate its life to be 20 years. These pumps are handled through dealers. My valuation of $360 includes the freight and labor in
455 setting it up. The item covered by Exhibit 7-I-38 I presume is a deep well pump but I do not remember. Its age is 20 years and its life is 20 years but it still has a little service value which is 25% of the reproduction cost. It is still in use though it may have lived the full average life. I have given the minimum value to it in accordance with the rulings of state commissions. The average life which I have given to each piece of equipment here is based upon tables showing what equipment of that kind has done and sometimes the equipment lives longer and sometimes not as long, but that is the only way that we can get at it. This average life is based on the experience of men throughout the country who have kept records of the life of a given amount of equipment. It is obviously impossible to take a single pump or a special piece of equipment and determine how long that piece will live.

The next item, Exhibit 7-I-38, a 3¼ x 4 x 6, Gardner duplex pump is a water pump and I understand it to be in use, but I do not have the piping in mind and I can not tell you its particular function, but it is probably used for pumping water from one part

to another in the plant. I cannot give you the separate items of the labor and foundation such as there is. I have placed the valuation here at $90 to cover everything and I find that $90 is the quoted price, F. O. B., New York, without foundation, handling, or erection. This was on February 13, 1904, and the price of pumps has gone up since that time. The pump covered by Exhibit 7-I-39 I valued at $95. It is four years old. It has no foundation except the planks. I think it is a water pump but it might be a tar pump or even an oil pump. The pump covered by Exhibit 7-I-40 is also in use but I do not remember exactly where. I have given it an age of three and one-half years. It should have been two years. The pump covered by Exhibit 7-I-41 is four years old. The next pump, covered by Exhibit 7-I-42, is one year old. The next pump, covered by Exhibit 7-I-43, is 20 years old. I have given it the minimum service value, 25% of its reproduction cost. I assumed
456 that this pump had a life of 20 years, and if the company had started out when it first installed that pump and laid aside a depreciation on the sinking fund basis, at the present time it would have a sum equal to the reproduction value of the pump. But by taking the average life of each piece of equipment we are doing what is fair to all concerned. The pump covered by Exhibit 7-I-44 is four years old. The pump has a life of 20 years. The purpose for which all of these pumps are used was ascertained by Mr. Brodnax and his assistants. It was understood that he was to include nothing except what was used or useful.

The Otis elevator covered by Exhibit 7-I-45 is in use in the generator house for the purpose of lifting coke to the operating floor. The elevator alone cost $940, the freight, handling, and miscellaneous, $120. I secured the price of this elevator from the builders of elevators. It is a complete electrically operated Otis elevator. The motor with it is given separately. The platform is 6 feet, by 6 feet. The item covered by Exhibit 7-I-46 is a Fairbanks scales platform, 4 x 4, which they use for miscellaneous weighing around the plant. They weigh coke, sometimes tar, and works materials and supplies. The price is derived from the quotations by builders of those scales. They are five years old. Their life is 15 years. The item covered by Exhibit 7-I-47 is used to test the candle power of gas. It is seven years old. I don't know whether they had one prior to this one or not. The price of this article is fixed. It is sold principally in Philadelphia. It would cost $410 at point of purchase, and the balance of the cost is for freight, handling, and erection. I assigned it a life of ten years which I have ascertained from experience. Its present per cent condition is 35.

The item covered by Exhibit 7-I-48 is used to test the heat units in the gas. It is three years old. The market price if you wrote for quotations would be $250, but there is a discount to these people. This item, with one meter, would cost $170. The meter is a
457 part of the machine. This has a life of ten years. The items covered by Exhibit 7-I-49, shop tools and miscellaneous items, were all furnished to me by Mr. Brodnax. I have no knowledge of whether or not they are possessed by the company. The cost which

I assigned to each of them is based upon my knowledge and records of the costs of similar items. I might be able to get a part of the total cost on a part of the items from the records of the company but it would be very unusual if the records showed the actual cost, because they are not kept with that in view, and it is not proper that they should be. For instance, on the drill press it would have part of the cost in the voucher covering the purchase price but the additional items such as freight, handling, and possibly the erection of a small foundation you could not find in the records of the company. I did not make any apportionment of these items in this exhibit between the electric and gas departments but less than $200 of the items shown in this exhibit are used in the blacksmith shop which is the only place in which they would have been common to both departments. The number 99 Buffalo forge drill press is the first article in the list which is outside the blacksmith shop. That is in the gas meter shop. The grindstone is the next item not in the blacksmith shop, but that might be used jointly by both departments. The oil filter is the next item not found in the blacksmith shop. The two 20-gallon waste cans is the next item. The galvanized iron lye tank, tire roller, and the meter test tank, are not in the blacksmith shop. The 2 x 24 x 6 oil tank, the three 1-inch Denni steam drips, the four number 1 lined water heater, the pipe rack, are all in the meter shop which is used purely for gas purposes. So is the pipe dripping trough.

The next item covered by Exhibit 7-I-50 are four boilers, 63 x 16, without settings. They are used as tar tanks entirely in connection with the gas department. I should judge that they are old boilers' shells. They do not use the tar for fuel in these boilers. I arrived at my valuation of these boilers by estimating the reproduc-
458 tion cost of shells of that kind and size. They were originally constructed for other use but they are as good as anything else. When they abandoned them as boilers the flues gave out but the shells were perfectly good and by removing the flues and putting in new heads they had the equivalent of new tanks. I do not have the details by which I arrived at my valuation of these tanks but I know that tanks of that size cost very close to $190 each. I assigned seven years as the age of these tanks, and their probable life as 40 years. The next item is the tar separators. They are used for separating water from the tar. It is a device which holds the tar in the first place and contains a series of wooden baffles and generally steam coils are placed in them so that the temperature when the separator is used may be maintained constant all over the tar as it comes from the coal gas or water gas plant. When it first comes it is mixed with water in the form of an emulsion. A good deal of time is required in separating the water from the tar. It is done by causing the machine to travel slowly at a maintained temperature round these baffles and after awhile the tar is thrown off at one place and the water at another. These tar separators are seven years old and their useful life is 40 years.

The next item covered by Exhibit 7-I-52 is a tar well for the storage of tar. It may be in the form of a tank. It is 3 x 3 ft., 3

inch, and it is 10 feet deep. It is walled up with brick and has a concrete bottom. The construction cost is $104. It has been constructed for 21 years, and its life is 40 years. The next item covered by Exhibit 7-I-53, is also a tar well 6 x 20 x 12, estimated to cost $472. It is 15 years old and its estimated life is 40 years. The next item, Exhibit 7-I-55, covers two steel tar tanks. They are Ten years old and I estimated their life to be 30 years. The two oil tanks covered by Exhibit 7-I-56 are ten years old and I estimate their life to be 30 years. I arrived at their net construction cost by considering the actual quantities of material and the local cost.
459 These are installed under contract only in connection with other equipment. Where bought separate they are shipped to the purchaser and put up by him, usually. The item covered by Exhibit 7-I-57 is a brick oil tank.

I arrived at the valuation of the items covered by Exhibits 7-I-60 to 7-I-64, inclusive, from my experience with articles of that kind. I made inquiry of the company for the price of pipe of that kind. I fixed the life of these several items from experience and their age was determined through inquiries of Mr. Brodnax and his assistants, and some of them from my own judgment. Some of them were determined by the ages of the equipment with which they are connected.

In Exhibit P in the first column I have given my estimate of the net reproduction cost of this company at the end of the year 1907, and the next column, for 1908, and so on down to and including the year 1912. That net reproduction cost for each year is based upon the inventory made at the end of 1912. For instance, the records show that during the year 1912 there were added a certain number of feet of street main, a certain number of services, and a certain number of meters. They also show that no addition was made to the real estate nor to the buildings during that year. The only physical equipment added during 1912 was in the distribution system and from the total reproduction cost of the street mains in use at the end of 1912 taking in connection the total number of feet of such mains in use at the end of 1912 you arrive at the average reproduction cost per lineal foot of street mains of average size. From this, figure the cost of the street mains added in 1912 and deduct that from the total reproduction cost and we have the reproduction cost for the end of 1911. On meters the records show the number of gain during 1912. Multiply that by the average reproduction cost per meter and you have the amount added during that year.

I did not know that there was an inventory of the company's property in 1907, and used at the former hearing in this case. I determined that it was more reliable and accurate to work back from the actual inventory of 1912. At least that was the most reliable
460 information which I had at hand. I have gone over the records of the company and I am certain that from those records an itemized list of the actual property and the actual cost to the company, of the items added during the years 1908, 1909, 1910, 1911, and 1912, cannot be secured. The books of the company do not

accurately show the total number of feet of street mains in use due to the fact that the personnel of the company's officers is changing more or less and frequently new men come on and take over the work of making these records. Extensions are made that are overlooked in the actual adding of them to the records and street main maps, and I have yet to find the first gas company with a record like that that is absolutely correct and that has an up-to-date record of its physical equipment. The only way to determine what a company has in the way of street mains is to forget about their general books and go back to their records. You first have to take the maps and service records and meter records and by a comparison of the services and meters with the mains reported on the map, determine whether or not the map shows correctly all of the mains, and check this information with the assistance of such local men as have been concerned directly with the extensions of the mains, services, and meters. And after having added to the map such items as you have found to have been omitted or taking from the map such items as you have found to have been incorrectly there, and have brought it up-to-date as nearly as the information available will enable you to do, you will then have to determine the scale on which the map was drawn and after that you must determine the shrinkage in the blue print on which the street main map was exhibited, and after you have determined the shrinkage in the blue print which depends on the quality of the paper and the exposure you have to determine the relation between the distances shown on the map and the piece of pipe that you know is a certain number of feet long. When you get that relation that will give you a correction factor and to make up for the shrinkage you have to add a certain unit of shrinkage of each
461 inch of main shown on the blue print. It is not added to the main but is added to the statement which is given to me through scaling the blue print. For all intents and purposes my inventory for the year 1907 working back from the inventory of 1912 would be a correct inventory.

Cross-examination continued by Mr. Foster:

The details for the deductions for each year in connection with the Exhibit P of works equipment and distribution system are shown under Exhibit Q. Each item shows the composite age and all you have to do is to make the deductions. On the mains I have used the average size. The history of all companies shows that the size of the pipe that they start out with always proves to be smaller than is required and they find it necessary in later years to lay larger mains. The details of the buildings are shown under Exhibit E.

On Exhibit P, for the year 1909, there appears to be $906 of buildings added. If you will add together the totals of the buildings of three years of age shown in Exhibit E you will get the $906. I do not think it is unusual to find ten miles of mains that the company has no record of. The inventory of the street mains which was made under my direction by Mr. Brodnax and his assistants was checked by them against the street main authorization cards, the service rec-

ords, the meter records, the information from the men actually employed in the extension of the distribution system, and was found to be correct. The 1¼-inch mains in this city are wrought pipe. It used to be iron but now it is steel. There is no difference in them so far as use goes except that pure wrought iron pipe will last a great deal longer than steel and also costs a good deal more and is practically out of the market. The letters WI on Exhibit J-4 mean wrought iron in the commercial sense of this pipe. It is sold as wrought iron pipe but it is not wrought iron. If you try to bind the manufacturer he will leave the iron out and just say wrought pipe.

Wrought iron is the standard expression. I understand all of
462 the 2-inch pipe is really wrought iron and I presume some of it is actually iron though I have made no allowance for it. I figured the 1¼-inch pipe in the mains on the unpaved streets at 18.57¢ per foot which includes everything and is the net construction cost of laying the pipe. The cost of the labor in Lincoln I figured at 23¢ which is 75% off the standard list. I figured the trench 36 inches of dirt over the pipe, and the trench will be that plus the diameter of the pipe. I figured 30¢ per yard for excavating and 15¢ per yard for re-filling and tamping. Cost of digging on a 1¼ inch main would be something over 6¢ per lineal foot. I got local prices on this and found that it was customary to pay $1.85 to $2 a day for ten hours for street labor. I did not ascertain whether or not there was any local standard of prices and I am not aware that the current standard here is 4¢ per lineal foot for a trench 3 feet deep. The gas company has always paid by the day.

For digging a trench through asphalt on concrete paving for the 1¼-inch pipe I figured a width of 22 inches; for brick on concrete, two-course brick, 31 inches; on the 2-inch mains under wooden blocks, a width of 31 inches; asphalt, a width of 22 inches; brick on concrete and two-course brick, 31 inches; for wooden blocks of 3-inch mains, 31 inches; for asphalt on concrete over 4-inch mains, 22 inches; brick on concrete, and two-course brick, 31 inches; on wooden blocks over 6-inch mains, a width of 31 inches; asphalt on concrete, 22 inches; brick on concrete and two-course brick, 31 inches; asphalt on concrete over 8-inch mains, I figured a width of 24 inches; brick on concrete and two-course brick, 33 inches; on the 10-inch main, asphalt on concrete, 26 inches; brick on concrete and two-course brick, 35 inches; on the 12-inch mains asphalt on concrete, 26 inches; brick on concrete and two-course — 35 inches; on the 16-inch mains, brick on concrete and two-course brick, 39 inches. On the 2-inch mains I figured a trench 36 inches to cover it. On all of the other cast iron mains I figured a trench 3 feet, 6 inches to cover it. On 2-inch mains the width is 22 inch; on 3, 4, and 6-inch
463 mains I figured a width of 22 inches; on the 8-inch mains, I figured a width of 24 inches; 10-inch mains, 26 inches; 12-inch mains, 26 inches; 16-inch mains, 30 inches; 20-inch mains, 32 inches. Asphalt on concrete paving over mains I figured $2.85 per square yard, which covers tamping and replacing the pavement. Brick on concrete I figured $2.45 per square yard; two-course brick, $1.68 per square yard; wood blocks, $2.25 per square yard. If there

is any paving included over mains in this list which has worn out and is not to be renewed so that no additional cost is involved in going over it, then it should be excluded. I have figured this work and the cost of the materials for these mains on the basis of reproducing the property as rapidly as consistent with good workmanship, and good economy just as though you had your money here and wanted to jump into this job and get your money working as soon as possible. The cost would be lower than it would be if it was done piece-meal. I have figured the net construction cost of laying 2-inch wrought iron mains in unpaved streets in Lincoln at 23.19¢ per foot. I made quite an examination of the company's books to ascertain what it did actually cost the company to lay 2-inch mains in these streets in Lincoln and I found nothing of value. The company's report and record for 1904 gives the average cost of laying 2-inch wrought iron pipe in unpaved streets in Lincoln at 19½¢; and in 1904 the records showed that the labor alone for 2-inch wrought iron pipe in Lincoln was 27¢ per lineal foot. In 1911 it was 21½¢. That does not include any paving that I know of. That includes only the labor and material entering into the laying of the pipe, and as a matter of fact the cost of tearing up and replacing the pavement is handled separately. My figures on the cost of paving were secured from the city engineer's office. I did not ask them for the price in any specific year but only for the fair reproduction price and the price I have is
somewhat lower than the actual price because it is based upon
464 what it was sometime ago. Prices now are higher.

I did not ask for or obtain the figures for 1911 and 1912 because I have found in all jobs I have been on that the present prices are higher than five years ago, and if I took the price then prevailing I certainly would be conservative. I obtained a number of actual costs in tearing up and replacing the pavement and they varied some from that which I arrived at, $1.92 per square yard for asphalt on concrete, and this appeared, in view of the variations, to be a fair average unit price. I did not consider the fact that the cost of asphalt on concrete paving was 19¢ less in 1912 than 1907, unless I had reason to believe it was a permanent downward trend. It might easily be somebody's politics. On the length of pavement over the service pipes I have estimated less than the company averaged where it goes through paving because on the reproduction of the property I would not follow the method they have been following here of tearing up the pavement. Instead, I would cut holes in the pavement and drive my pipe through saving some of the paving cut. The average of the paving cut for each service on the basis I have figured it would be holes averaging five feet by two feet, and the concrete, 17½ square feet, and if the main was on the other side of the street there would be one hole on the other side and it would only make two holes averaging 1½. On the 4-inch mains in 1909 the records show $1.04 per lineal foot for cast iron pipe laid in unpaved streets while in 1912 it was 41.8¢ and in 1911 it was 54.4¢. This should be conclusive evidence that the records of the company cannot be accepted on that kind of a thing. There was no paving included in that high price as far as I can determine. Again in 1905 the records show the

total for labor and material in unpaved streets and the cost per lineal foot for 4-inch cast iron pipe was 27.8¢ per lineal foot. I have used 56.7¢ the last three years because the records are not complete, that is, complete in details. I have never yet found a company showing all of the items entering into the actual cost of laying a foot of any size of pipe. They will always approximate it.

465

In Exhibit Q-2 I have taken the number of feet of mains regardless of size and computed the average composite age and I would be glad to use a more accurate method if it can be shown. I know of none more accurate. The ideal method of working out the composite age of a street main system involves going back to the very first year of construction and taking the actual record of each size and kind of main in feet laid during each of those years up to the present time but it is physically impossible to do that as there are no such records. It is just as fair since there are no records to accept the average size and talk in feet. The records do show that the 10, 12, and 20-inch mains were all laid prior to 1903, but since they were all cast iron I have no hesitancy in saying that if you were to make a calculation on that basis that the greater length of life of cast iron plus the original cost for laying, if carried through to date, would give a larger present value of street main system than I have given, but I would not be able to justify doing this because there are no records to substantiate it.

It is impossible to go back to 1873 on the dollar basis, but on the foot basis you can go back that far as accurately as possible. The cast iron mains laid at that time would be in much better per cent condition today than the wrought pipe. On a 3-inch cast iron pipe I figured a weight of 14.54 lb.; 4-inch pipe, 19.38 lb.; 6-inch pipe, 30.6 lb.; 8-inch, 42.84 lb.; 10-inch, 56.92 lb.; 12-inch pipe, 73.95 lb.; 16-inch pipe, 110.47 lb.; 20-inch pipe, 153 lb., which are the standard gas pipe weights corrected for foundry differences. They became formally standard in 1903, but were in use and accepted many years before. The formal standard prior to that was heavier. On the 3 and 4-inch pipe I figured $32 per ton, F. O. B., Lincoln, and on the 6-inch and larger, $31 per ton, F. O. B., Lincoln.

466

HENRY I. LEA, recalled for further cross-examination, testified on behalf of the plaintiff as follows, pages 1149 to 1292, Vol. 2, original record:

Cross-examination by Mr. Foster:

The weights given were the standard of the American Gas Institute plus 2%. This 2% is added because most of the companies manufacturing gas pipe have a standard of 2% foundry over-weight. It varies to 5%. It sometimes runs below the standard and unless the depth of pipe specified is given as a minimum it is very rare. The pipe won't bear the strain if it is under and the logical thing to do is to have it over-weight, and the practice shows the average is 2% above the weight specified. I did not weigh any of the pipe used by the company but I have no reason to believe that there is not a good deal of the pipe heavier than I have specified because

it was the custom years ago to use a heavier pipe. There was no standard 20 years ago and there is no universal standard now. They have been trying to standardize gas pipe for the last twelve or fifteen years. The standard given was a modification of the old standard of the old American Gas Light Association. I did look at some of the bills and they told me the price per ton for some of the old pipe that the company laid but it was not very significant as I saw so few bills.

Cross-examination continued by Mr. Adams:

The trenching and back filling placed on the unit price of 30¢ per cubic yard for excavating and 15¢ for re-filling for the different pipe are as follows: for a 3-inch pipe, $.1170; 4-inch pipe, $.1170; 6-inch pipe, $.1220; 8-inch pipe, $.1390; 10-inch pipe, $.1560; 12-inch pipe, $.1620; 16-inch pipe, $.2010; 20-inch pipe, $.2300. The entire cost per lineal foot of handlin*d* and laying the pipe complete exclusive of the cost of the pipe itself, is as follows: 4-inch pipe, $.1258; 6-inch pipe, $.1591; 8-inch pipe, $.2132; 10-inch pipe, $.2833; 12-inch pipe, $.3531; 16-inch pipe, $.4956; 20-inch
467 pipe, $.6738. The cost of the pipe itself per lineal foot, F. O. B., Lincoln, is: for the 4-inch pipe, $.3101; 6-inch pipe, $.4743; 8-inch pipe, $.6640; 10-inch pipe, $.8822; 12-inch pipe, $1.1462; 16-inch pipe, $1.722; 20-inch pipe, $2.3715. The specials on all sizes amount to 4½% of the pipe cost. This is wrought pipe. The trade designation is Black Pipe, Merchant Wrought. For the 3-inch pipe the cost per lineal foot is as follows: the actual cost of the pipe, $.2326; handling and laying, $.1062; trenching and back filling, $.1170; specials, $.01015. The cost of the pipe alone, per lineal foot, is: for 1¼-inch pipe, $.0575; 1½-inch pipe, $.0688; 2-inch pipe, $.0295; the cost of handling and laying, per lineal foot, is as follows: for 1¼-inch, $.0288; 1½-inch, $.0327; 2-inch, $.0384; the cost of trenching and back filling in dirt streets, per lineal foot, is: for 1¼-inch pipe, $.0968; 1½-inch, $.0968; 2-inch, .0968. The cost of the specials, per lineal foot, is: for 1¼-inch, $.0026; 1½-inch, $.0031; 2-inch, .0042.

For the joints on the cast iron pipe I have figured but few flanges and principally balance spigots, and for joining material I have figured on using lead, cement, hemp, jute, and oakum, with the majority of the joints being lead. In my costs I have figured the same definite quantity and amount of money for each size for joint material and I arrived at that by assuming prices low enough on the lead to allow for cement joinings they having been made in the *in the* last few years, by taking a price I knew was less than what lead would cost. I figured 5¢ a pound for the lead. I know that the price was higher. The weights that I have used here on this pipe I have used in other cases before public service commissions and they have met with their approval. I do not know of any gas light association that adopted those weights prior to 1905. I believe that most of the cast iron pipe in this plant was laid prior to that time. In estimating the weights on all of the cast iron pipe

I used the weights which my experience in connection with many plants has shown to be generally used. I did not make any inquiry
of the company as to what the pipe actually weighed nor
468 did I make any investigation of the company's records to find out if they showed what it actually weighed, because the records of a gas company are not kept to show things of that kind and I have never found a gas company yet that did keep its records that way. I have made sufficient inquiry to satisfy myself that the weights I have used will average as they have averaged in many cases. I cannot say off-hand whether the bulk of this cast iron pipe used was in the ground prior to 1901 or not. I have used in my estimates I have assumed the following weights of different sized pipes: 6 inch cast iron 30.6 pounds per foot; 10 inch 56.92; 12 inch 73.95; 16 inch 110.47 (p. 1170-1173).

On railroad crossings I have figured a very reasonable cost based on the practice which is in addition to the ordinary cost of laying the pipe. These costs are as follows: for single electric crossings, $15 each; for the double electric crossings, $20 each; for the triple electric crossings, $25 each; for the single steam track crossings, $20 each; I do not know of there being any double steam track crossings over these gas mains. In making these figures I did not figure on any permanent special construction in the ground and there are none there that I know of. These figures are the actual cost in reconstructing the property under existing conditions. They include temporary structures while the work is going on in some instances.

I made no investigation as to the particular cost here but I had determined the number of crossings of each kind, and from my own experience in laying such mains I knew what the reproduction cost under those conditions would average. These figures involve the extra caution necessary in going under the tracks, the extra care required in guarding the trench, temporary trestles required, and all of the incidental expense involved in going under the street clear. It is necessary to secure special permits at the cost of considerable time and a whole lot of argument with the railway and railroad companies. I have never seen a gas company's records that were capable of showing these cost items. There are a total of 349 steam and electric crossings in Lincoln. I do not know the size or kinds of pipe under them, but so far as the separate cost
of the separate crossings themselves are concerned that does
469 not make any difference. The cost of the crossing is in addition to the other cost of the cast iron pipe, etc. This pipe usually comes in 12-foot sections, and the steel and wrought iron pipe, in 18 and 22-foot sections. Where there is a screw joint the cost of a crossing might be smaller but my figure is an average of all kinds, which is made from my own personal experience in a number of cities on this particular item. I think that is as close as anyone can get.

You have got to buy so much lumber. You have got to provide considerable bracing. Some railroad companies won't let you do your own bracing but insist on doing it for you and charging you

with the expense. The 200,000 foot holder is of a type very commonly used and I have figured the weights as follows: lifts, 137,160 pounds; steel in the guide frames, 75,500 pounds; tank connections incidentals, 30,000 pounds, making a total altogether of steel and iron of 242,660 pounds. I arrived at the weights of the guide frames by referring to my record of actual weights of guide frames for holders of that size and type, taken from construction companies' records. The weight I have given to the guide frames is the fair average on holders of that type and size. I know that from my experience but also from the experience of holder builders. I also had some measurements made. They are: inside diameter of the tank, 85 feet, 6 inches; maximum depth of the tank, 21 feet, 3 inches; minimum depth of tank, 6 feet; maximum pressure thrown by the lifts, 4.5 inch water column. The guide frame is fitted to the tank. No particular measurements were made of the guide frame itself. This holder has a brick tank with a concrete bottom. There are 30,000 lbs. of steel and iron in the tank connections, and miscellaneous items, which includes the large
470 in- and out-let pipes which carry the gas, at 10,000 pounds. I did have the size and length of these pipes but I do not have them here. But this is the average weight for holders of that size and type and size of pipe. These pipes begin and end with the drip pots and the weight which I have assigned to them is the average weight for holders of that size. The drip pots are usually three or four feet outside.

I know that in estimating the reproduction cost of that holder that if I take 10,000 pounds for connections and multiply it by a certain number of cents per pound I will arrive at the reproduction cost. I do not know what the weight actually is and I have no means of finding out but I have been told what the size of the pipe is that extends from the drip pots into the outer wall, but I have forgotten what it is. Deducting this 10,000 pounds from the 30,000 pounds leaves 20,000 pounds for the weight of the iron and steel embodied in or used in connection with the brick holder tank. This does not purport to be a representation of the iron that is actually there, but that is what would be regarded as a fair average figure for that size of tank. A portion of it is in the tank, a portion of it is in the crown, a portion of it is in the wind ties, and a portion in the diagonal braces. Part of these might be above the top of the brick tank and part below. I am unable to say how much as I did not prepare my estimate that way. I am unable to say how much weight there is above the top of the brick tank. 137,160 pounds is in the two lifts which includes the weight of the bracing but not the cost.

On the 500,000 cubic foot holder my total weight of steel and iron is 690,550 pounds. The weight of the floating or movable portions is 279,917 pounds, which leaves 410,635 pounds. There is an error of two pounds there. The weight of the tank is 280,000 pounds, which leaves 130,635 pounds to be accounted for elsewhere. I have allowed 10,000 pounds for inlet and outlet connections which

is the same as on the other and they average very nearly
471 the same. I have been told what the actual inlet and outlet connections were in this holder but I have forgotten it. I did not figure up the weight on what they told me as that would not have told me what else was inside the holder. In order to figure that weight you have to know what is inside and I have taken the average weight on holders of that size. I found that they were within normal range. This leaves 120,635 pounds yet to be accounted for. This is as follows: 72,810 pounds are in the 10 columns of the holder; 35,185 pounds are in the 30 girders. 12,640 pounds are in the diagonal braces and wind ties.

I arrived at these weights by an examination of the weights of builders of holders of that type and size. I do not know that they are the exact weights of this particular holder. I had measured for me those parts of the holder that are readily determined in that way, which were the diameter of the tank, the height of the tank, and pressure thrown by the holder when filled. I did not measure the detailed members of the guide frame. I took the average price of 6¢ a pound for the iron and steel in the 200,000 cubic foot holder because I knew it to be a price fairly representing the construction cost. On the 500,000 cubic foot holder I took the price of 5½¢ per pound for the steel and iron, which I know to be the fair reproduction cost per pound for the steel and iron in that holder. This is based on my knowledge of the construction cost and erection cost and selling price of gas holders and the prices paid by various gas companies in various parts of the *company* with whom I have been in contact, and whose records have been open to me.

I can't give you the name of any company that has paid these prices off-hand, but I can go to my office in Chicago, and refer to my records and tell you. I do not have with me any of the contracts or prices for any special gas machines erected in any plant. I have personally closed a great many contracts of that kind but I do not have those contracts here. The same is true of gas holders. I compiled my reproduction costs in my office where these records
472 were available. I saw a drawing of the 200,000 cubic foot holder, prepared by Mr. Brodnax or one of his assistants, within the last sixty or ninety days, upon information obtained by inquiry of the men in the plant or who were there at the time it was constructed and who remembered the formation. It showed the thickness of the tank walls as near as could be determined, which was by inquiry and measurements and copying the portion exposed, but I do not know that any excavation was made to determine that. There is not much chance to go wrong on that as in the actual construction of the tank the practice is pretty well defined as to what it must be. The amount of cement plaster on the concrete amounting to 660 square feet, I presume was determined by inquiry at the plant as to how the tank was finished. The drawing may have been based upon actual drawings as the work was built. I think I had a drawing of the 500,000 cubic foot holder.

The amount of concrete in the foundation of that holder was given to me by Mr. Brodnax. He secured it by calculation and from what

461

information he could obtain. I think he probably had access to the drawings which showed the actual amount of the concrete used there. If he didn't it is possible to arrive at very nearly the correct amount of the concrete in the foundation without a drawing as it is only a pan. When I was at the plant I noticed that it was a very poor spot to build a plant because of the excessive cost. I do not know whether a better one was available or not but the place is low and there is trouble from water in any big foundation work, particularly the building of holders, and considerable filling has had to be done and the place now is still lower than some levels not far away.

I think the present site of the gas works is somewhat higher than the property just beyond the railroad. In three directions the land seems to be about the same level and on the railroad side it is three or four feet lower. That is only my recollection. I would not be surprised if the land about these gas structures is three or four
473 feet higher than the land immediately adjoining on three sides. The fact that the land at the plant has been filled in would not have any bearing on my items of excavation, back filling, and disposal of surplus material as they are figured on the basis of reproducing the property under existing conditions today. The depths of the foundations for the buildings and the various gas machinery was arrived at by Mr. Brodnax through inquiry and in some cases by measurements. I am not familiar with the details of his measurements but I was down there and satisfied myself that he had shown the dimensions substantially correct and they looked reasonable and in accordance with the usual practice.

For instance, for the foundation for a water gas set they could be able to measure accurately without any considerable digging because, knowing the size of the set and knowing what is required to sustain it, it is easy to determine what would be a reasonable foundation, and I think these foundation beds there thoroughly represent the actual condition. I don't say that they are the foundations that would be required in all cases. They are lighter in some and heavier in others. My total weight of the steel in the 50,000 foot holder is 58,200 pounds. I worked up in detail, 58,234 pounds, but in the cost I used 58,200 pounds. There is 33,264 pounds in the lift or moving part. This leaves 24,970 pounds to be accounted for. Of this sum I allowed 5,000 pounds for cast iron inlet and outlet connection pipe. I think they are 8-inch. I did not know the length but I arrived at the weight by taking the average weight for connections in that size holder.

I have no way of determining what actually exists there without getting inside the holder which is impossible. That leaves 19,970 pounds to be accounted for. 225 pounds of this is in the guide rails; 14,645 pounds is in the guide frames or girders; 625 pounds for the foundation bolts; 450 pounds for the wheel sleeves; and 2,000 pounds in miscellaneous items. These amounts are derived
474 from measurements of the holder in connection with my knowledge of the current practice in the construction of holders of that type and size. I was able to figure the weight of the guide frame at 14,645 pounds through knowing the diameter of the

tank, the width and height of the lift, which is here that a man needs to know who is familiar with the business. This is the average for holders of this type and size. The actual weight there might be more; it wouldn't be worth while to measure each of the little ½-inch strips comprising each individual brace, but the dimensions of the guide frame are covered by the dimensions of the holder and the tank. I have in a number of cases made detailed estimates covering each of the individual pieces of metal going into a gas holder, and each of the members comprising the holder as a finished product, and I arrived at the weight of 14,645 pounds by taking an average.

I understand that the connections in the 200,000 foot holder are 12-inch. I have not changed my figures at all as a result of that dimension. Where I am unable to determine within a reasonable time the actual condition of the detailed parts I have used a fair average cost and when I put down 10,000 pounds it is in view of the prices that I am placing that cost at a very fair average as a reproduction cost of the item I have made the price on, and I hold to that irrespective of the actual size of the parts and concrete information as to the actual size of these connections is not going to affect the cost I have used in the slightest degree, because I am only trying to arrive at the average cost of these items that I am not sure of, and I know what the fair average is. I might tell how many given feet there are and I would be a trifle nearer but not enough to affect the cost. I would still have to estimate the balance of the parts unless I went into the holder and into a detailed and elaborate investigation that nobody would consider warranted. The benches here are of a type built exclusively by single concerns. These are Parker Russell benches. I thing the furnaces are ½ or ¾ depth. There
475 are benches of other makes about the same in cost and selling price but not the same in construction.

The Parker-Russell benches are more expensive relatively than others because their retorts have a better reputation than most others. As compared with other Parker-Russell benches erected elsewhere of the same general type I do not know of anything which would make these more substantially built than others. As to the street mains it is absolutely necessary that all of the mains now under paving be put there because if you do not do that you are not allowing in the reproduction cost of this property the reproduction of this particular property as it is here today. I have not examined the streets to ascertain whether it is physically possible to put the mains elsewhere. I suppose there are some alleys that could be utilized but I am not concerned with that.

I could easily build a new gas plant that would make as much gas as they are making here with a smaller expenditure but that isn't what I am required to do in a case like this. These people didn't have the foresight twenty years ago to know what they are doing today in gas plant construction. I have figured on reproducing the property as it is and not a hypothetical plant. In my valuing of this plant I have gone on the method of determining the cost of reproducing every element in its exact location and condition so far as can be done. I have not used a uniform price for every item of

concrete in the plant. The same price is used for similar conditions. In the purifying house on the 8-inch concrete floors I have figured the concrete at 14¢ per square foot in place. I am told that these floors are 8-inch floors but have no personal knowledge, getting this information from men who saw them put in or who have been chopping holes in them. I put the 8-inch concrete floors in the retort house at the same figure. The concrete floor was 4-inch in the generator house and I have put it in at 7¢ per square foot. The concrete in the foundations in the meter shop and booster house I have
put in at $8 a cubic yard in place. It was a 1-2-4 mixture
476 with Portland cement at $1.65 a barrel.

I did not try to determine the actual mixture on all of the buildings but I took what I knew would be a fair cost per cubic yard for these concrete foundations. The concrete in the 500,000 foot holder I figured at $7 a cubic yard. There the work is easier to handle and the labor cost per unit of product is lower. It is not any better grade of cement. In the 200,000 foot holder I figured $5 a cubic yard for the concrete. There is a considerable quantity there and it is easy to place so the cost is very low in place. The concrete there is not any better than 1-3-5. On the brick in the walls of the purifying house I figured $17 in place. This is per thousand. The brick in the pilasters and cornices I figured at $21.25 in place.

I figured the same on the generator house. By a thousand brick in place I mean the commercial understanding of one thousand brick in the wall. I do not know what the size of these brick in this building is. I did not obtain the information myself but I told Mr. Brodnax the basis on which to arrive at those figures, and when I say 187,843 brick in the walls of the purifying house I mean that they are the equivalent of that many brick at $17 per thousand. I cannot tell you how many brick are actually there.

Before this figure was arrived at the number of cubic feet of brick work in that wall was determined. Mr. Brodnax has that information and has also the size of the brick. I did know how many brick per cubic foot of brick work Mr. Brodnax estimated on before but I have forgotten. It met with my approval when I did know. But Mr. Brodnax can give you all of this information.

My cost of $17 per thousand for the brick in the walls of the purifying house is made up of the following items: good brick delivered at the plant, $7.50 per thousand; to lay what is left, after allowing for the breakage, for the thousand required half a cubic yard of sand. It costs 75¢ delivered or 38¢ per thousand brick in the wall for the
sand. Portland cement cost $1.80, and it will require .44
477 bbl. per thousand brick in the wall, or 79¢. It requires 2 bbls. of lime which will cost 40¢ per bbl., or 80¢ per thousand brick. The total material cost is $9.07. Your brick layers will cost 60¢, or $4.16. Your laborers will cost 17½¢, or $1.87. Your carpenters will cost 20¢ to 22¢, or 77¢. The handling of these various materials cost $1.16. This makes a total labor charge of $7.96, making the total labor and material per thousand brick in the wall, $17.03.

I do not remember now how many brick we figured we could have gotten laid into the wall for this $17.03. The matter was determined before the inventory was made. It was acceptable to me and I state that it was correct and I believe that it was followed throughout. Mr. Brodnax can tell you whether or not it was. In figuring this unit I did not take any particular building but I took what I believe to be, and I think this is, an absolutely fair average for the whole job as far as the costs are concerned. Mr. Brodnax told me that some of the mortar used in this brick work was cement and some was lime. I made it neither lime nor cement but an average.

On the 7 foot, 6 inch water gas sets I figured the concrete at $9 a yard, 26½ in each. This covers the foundation for the generators, carburetors, super-heater, and wash boxes only. The foundations under these 7 foot, 6 inch sets was determined by inquiry and measurement. I do not believe any parts were measured except the exposed parts of the foundation. I think a sketch was made showing the foundations. I do not think that there was a drawing of the foundations as they actually went in but they are almost standard and when you know the size you know in a very general close range what quantity of concrete is required. Under normal conditions this is true.

The 6 foot Parkinson meter with a differential of 1 inch has a capacity of 297,600 cubic feet each 24 hours. The 10 foot meter with a Hinman drum has a capacity of 864,000 cubic feet per day. In order to determine what capacity of station meter is necessary you must determine the maximum demand required at any hour. I have forgotten what the maximum demand in this plant is.
478 I have seen the returns, however, showing the peak loads. Without going back to the curves which I do not now have I could not tell you whether this meter is good for any number of years to come as far as its capacity is concerned or whether it is too large or too small. It is impossible to estimate what meter is necessary on the average daily output.

For the cost of disposing of the surplus material from the excavation for the purifying house and the 500,000 foot holder I figured 50¢ a yard and $1 a yard for excavating. I considered that it would be hauled to the nearest dumping place. I did not measure where that would be, but I took the average cost for the removal under conditions of that kind. If the entire amount of the dirt was used within 150 feet of the excavation that would not change my estimate. I believe that the cost of handling this material in the reconstruction of this plant would average 50¢ a cubic yard for such work as that whether 100 feet or 50 feet. In the 100,000 cubic foot holder I charged 25¢ for back filling and removing the surplus material. I did not feel warranted in assuming that the material would be spread out between the different structures. I estimated various lengths for the haul. I did not try to itemize them, but lumped it off at 50¢ a yard. 50¢ a cubic yard is the equivalent for the cost of labor and time of handling that stuff about a mile and a half on a straight haul. It might easily cost more to get it distributed around

than to get it moved on hauls of one and a half miles. I have seen records on hauls inside of blocks which have been filled three and four feet with hauls of less than four blocks and actual cost running as high as 75¢ a yard where they just hauled it and dumped it. The total yardage of back filling for the district holder was 5487.5 yards and I figured 25¢ for the disposal of the surplus material out there, amounting to $1,372. I concluded it would cost about half as much to move it out there as it did down at the plant.

I heard Mr. Freauaff testify yesterday that under certain conditions it was advisable to save cost by building district holders in residential sections and there are a number of holders in Chicago
479 where the same idea is followed out. There is one 5,000,000 cubic foot holder located at 47th and 12th streets, Chicago, one and a half miles from the nearest generator house. Denver also has a 5,000,000 cubic foot district holder.

In the location of district holders the distance from the manufacturing plant is not the determining factor, but location right at the plant is the antiquated notion of construction. If the growth of this town continues and the demand for gas increases it will not be many years before it will be advisable to increase the number of district holders. I do not believe it is advisable at this time. The reason for the construction and location of a district holder in East Lincoln was to send the distribution of gas at low cost per thousand and it works out as expected. I think they save money by putting that holder out there because you have to run some kind of a line to supply the district in which the demand is beyond the capacity.

When you find a district that is not properly supplied from the holders at the station and it becomes necessary to get more gas into that district in some way you must either lay larger trunk lines to distribute the gas at the former low holder pressure from the plant to this district, in which event you will have a very slow rate of travel through the main with a relatively high investment per foot of main and a condition which is not anything like it should be. Under the large holders at the station the consumers must many times every day use the gas under pressures too low to attempt any economical operation of their stoves and the consequence is that their loss from radiation is relatively very high. They get out of their dollar's worth of gas much less heat than they would get under proper conditions of pressure. It is impossible to get the proper conditions when the old holder pressure is used alone. So we are getting to the condition of higher pressure distribution which enables them to distribute a given quantity per hour through a smaller pipe. By means of recording gauges and charts, it was found that the district
480 in East Lincoln was growing beyond the capacity of the main and something had to be done to relieve that situation. That neighborhood at that time was supplied under low pressure and it was necessary in that case to distribute the gas to East Lincoln under low pressure. That made it necessary to get the required volume of gas to East Lincoln which would take the maximum minute peak load to meet the demand and that had to be under low pressure. There was only one way for doing that and that was to put a district

holder there. The necessity of the holder being determined the only question remaining was the kind and size of pipe to use, and it was decided then that having the holder it would be better to use the small pipes with high pressures and a service regulator on each service than the larger pipe with low pressures. The holder was put there to economize the distribution of gas and part of the economy was in the smaller size of the pipe used, and the holder not only enables the company to give a better service but also makes possible a more economical use of the gas by the consumers.

The consumption of gas per block in a given district is not a factor which determines the location of the holder, and I do not know what the consumption is in other districts. The proper condition from the consumer's standpoint is absolutely uniform pressure. The company is also boosting its pressure at the works and they are able to do that by having service governors on the individual services, but that is not possible under any scheme that involves the distribution from the holder at the plant with no other assistance. At the time the holder was constructed the town was not on a high pressure basis. The fluctuation was very bad throughout the outlying districts. It was not only the distance from the plant but it was also a matter of elevation. It is practically impossible in any town that is not built on an absolute level to design a distribution system of any kind that will give a uniform pressure throughout the entire area. The town is now on a high pressure basis. Everybody has a service
481 governor with the exception of about a hundred or so. There is a pipe running from this district holder to some two or three little towns outside of Lincoln. I do not know the size. I do not think that the supplying of this district outside of Lincoln had anything to do with the location and construction of that holder because it would have been extremely bad business to build a holder of that size for that business. The pressure chart showed that something had to be done immediately to supply Lincoln and a larger pipe would not have distributed the gas. It would not have been as well to distribute it with a large pipe as it could be with a smaller pipe with higher pressure, and it would have involved a materially greater cost. The conditions shown by the charts could have been bettered by putting on service governors and running the gas from the station holder at a higher pressure, but that would have meant the putting of the entire city on high pressure at once. You can't operate service regulators on low pressure. You have got to get on high pressure before you put on regulators. If you had regulators used in East Lincoln and none down near the plant under high pressure the people near the plant would be in danger and you would possibly have killed a number of people.

HENRY I. LEA, being recalled for further direct examination, testified on behalf of the plaintiff as follows, pages 1664 to 1669, Vol. 2, original record:

Direct examination by Mr. Strode:

In subdivision E of my exhibit which is the compilation of the corrected net earnings of the company for 1907 to 1912 I did not

take into account any charge against the gas company on account of occupation taxes. The decision involving the legality of those taxes had not yet been made when I made my calculation. I have since computed the amount that this occupation tax would reduce the net earnings without figuring for interest or penalty. If interest or penalties were charged the reduction would still be greater. Under the first ordinance which was 2½% of the gross sales the tax
482 amounted to: for 1907, $5,394.40; for 1908, $5,858.64. From January 1, 1909 to December 13, 1909 it would amount to $5,767.98. The 3% occupation tax from January 13, 1910 to January 1, 1911 was $7,304.17; from January 1, 1911 to January 1, 1912, $8,228.79; and from January 1, 1912 to January 1, 1913, $8,364.86; January 1, 1913 to July 1, 1913, $4,141.80; and the total of these occupation taxes is $45,160.69. This is the amount simply on the gas sales and each of these amounts should be deducted from the net earnings for the different years as shown in my exhibit and reducing the net earnings by these occupation taxes the amounts shown in Exhibit P should be as follows: for 1907, $52,727.31; for 1908, $74,820.16; for 1909, $85,940.51; for 1910, $79,438.82; for 1911, $80,560.59; for 1912, $67,433.94. Computed on these net earnings the rate of return on the reproduction cost of gas at $1.20 per thousand cubic feet are as follows: for 1907, 5.528%; for 1908, 7.447%; 1909, 7.674%; 1910, 6.674%; 1911, 6.370%; and for 1912, 5.163%. On the present value for each of these years the rate of return after deducting the occupation taxes from the net earnings is as follows: for 1907, 6.376%; for 1908, 8.575%; 1909, 8.869%; 1910, 7.726%; 1911, 7.368%; and for 1912, 5.952%. If the gas was sold at a dollar a thousand the 3% occupation tax would make it a little more than 97¢ as gas selling at a dollar will bring a net receipt of a little above or a little below that amount.

HENRY I. LEA, being recalled for further direct examination, testified on behalf of the plaintiff as follows, pages 1676 to 1682, Vol. 2, original record:

I have made a tabulation showing the net earnings of the gas company based on the dollar rate for the years 1907 to 1912 inclusive, taking into account the same items of expense as are shown in Exhibit P of Exhibit 7. The corrected net earnings as shown in this exhibit would be reduced by the following amounts for the different years, these amounts being one-sixth of the total gross earnings as reported, which accounts for the difference between the $1.20
483 and the $1 rate: for 1907, $35,962.70; for 1908, $39,057.92; for 1909, $40,854.12; for 1910, $41,990.39; for 1911, $45,715.49; and for 1912, $47,027.02. The net earnings after making these deductions and before deducting for occupation taxes would be: for 1907, $22,159.01; for 1908, $41,620.93; for 1909, $50,854.37; for 1910, $44,752.60; for 1911, $42,073.89; for 1912, $28,871.78. The occupation taxes reducing the gross earnings under the dollar gas with the sales as previously shown figured on 2½% from January 1, 1907 to December 13, 1909, and from January 13, 1910 to

January 1, 1913 at 3%, would have been as follows: for 1907, $4,495.34; for 1908, $4,882.24; for 1909, $4,905.47; for 1910, $6,084.41; for 1911, $6,857.32; and for 1912, $7,054.05. And the net earnings reduced by these amounts for those years would then have been as follows: for 1907, $17,663.67; for 1908, $36,738.69; for 1909, $45,948.90; for 1910, $38,668.19; for 1911, $35,216.57; and for 1912, $21,817.73. These figures would have shown the following returns on the reproduction cost of the property for the respective years: for 1907, 1.852%; for 1908, 3.657%; for 1909, 4.103%; for 1910, 3.249%; for 1911, 2.785%; and for 1912, 1.674%. The rate of return on the then present value for the respective years would have been as follows: for 1907, $2.136%; for 1908, 4.211%; for 1909, 4.742%; for 1910, 3.761$; for 1911, 3.220%; and for 1912, 1.925%.

The gross earnings for the company for 1913 are going down and it shows that I made a poor estimate on the increased earnings of the company for this year. This is explained in part by the records of the electric department which show a considerable growth and in view of the unusually severe competition between the electric companies. The electrical appliances are replacing gas appliances in a considerable number of cases. By appliances I mean those other than light. We used to show an increase in gas sales largely due to the use of gas irons and the number of small devices. These are being met here by a competition with the electrical appliances. The actual records of the company so far this year show the gas considerably below the same period of last year. Since the passage
484 of the ordinance the electric business has practically supplanted the gas business in the lighting field.

Prior to 1906 gas was used for lighting purposes. Since that time the percentage of lighting done by electric current has constantly increased, and gas has been driven back to the field of fuel. That field is increasing but if the lights don't reach those fields it does not do you much good. Every electric company sells electric irons and toasters in plants of that kind at this time. Six years ago they were not known. They are now in very common use. This very directly affects the sale of gas by eliminating gas. Until a few years ago there was no satisfactory electric flat-irons but today they have good electrically heated flat-irons and many people would rather have them than the gas iron. There are also a large number of small cooking devices which are operated by electricity and the electric business has also gone to the regular range in the kitchen and they have electric cooking apparatus. I know of one town that had no gas whatever in the spring of this year and they had over three hundred cooking ranges operated by electricity.

As the situation now stands I have no doubt but what the electric business will continue to make inroads on the gas business in a number of fields and I do not know of any way the gas company can meet this competition on its present basis. The cheaper electric power the other companies furnish would crowd the gas company still further away and it is an extremely small amount of power de-

veloped with gas here today and that amount will decrease as time goes on because the electric companies will likely continue to reduce their rates for power purposes.

The use of electric current for heating is cheaper to some extent but not for general heating. It is for minor heating. I do not know of any place where houses are heated with electricity. I know of a few places where electric ranges are installed in kitchens but they have not yet reached a point where they constitute any serious menace to the gas business.

485 HENRY I. LEA, being recalled for further direct examination, testified as follows on behalf of the plaintiff, pages 1771 to 1814, Vol. 2, original record:

Direct examination by Mr. Strode:

I prepared Exhibits 103, 104, and 105. Exhibit 103 shows the amount that would have been paid by the gas company because of the occupation tax from January 1, 1907 to July 1, 1913, if the two ordinances had been effective. Exhibit 104 shows the corrected net earnings of the gas department as affected by the occupation tax which is referred to on the assumption that the price of gas for the years shown would have remained at $1.20. Exhibit 105 is a statement of the corrected net earnings of the gas department as affected by the occupation tax as affected by the assumption that the price of gas was $1 per thousand cubic feet throughout the years shown. Exhibit 106 is an abstract from the records of the gas department showing the total income from gas sales, meter charge on minimum bills, forfeited discounts, total earnings from gas, bad debts, gross earnings from gas, operating expenses exclusive of depreciation, and the net earnings of gas for each of the first six months of this year. It also shows the total for each of these items for this period, showing the deductions for sales outside of Lincoln and the amounts representing sales, etc., within Lincoln proper. It is an extension of the corrected net earnings shown on subdivision P from the end of 1912 to the middle of 1913.

Cross-examination by Mr. Morning:

Exhibit 107 is the gross earnings as reported and from them are deducted the sales outside of Lincoln, getting the corrected gross earnings of the gas department within the period as far as shown. And a report of the sale of gas outside of Lincoln deducted from that to get the output of gas within Lincoln, to that is added the depreciation of one-half of the corrected amount on last year's equipment though the present equipment is more than that, which shows
486 the corrected operating expenses to have been $103,400.25, and the corrected net earnings, are $25,208.82, which is considerably less than the first six months of last year at the present rate. At that rate the corrected net earnings of the gas department will be 3.86% of the reproduction cost for the full year and on the present value it will be 4.448%. The earnings promise to be for this year

$25,000 less than they were a year ago. Exhibit 108 is a statement of how the corrected net earnings for the first six months of this year would be figured had the occupation tax been in effect with the price of gas at $1.20. It shows that the net earnings for that period would have been $21,350.55, a return on the reproduction cost of 3.268 per cent per annum, and on the present value a return of 3.768 per cent per annum. This exhibit also shows how the net earnings would have been affected during that period had the occupation tax been in effect and also the price of gas been $1 per thousand with the same sales. Under that the corrected net earnings before a deduction of the occupation tax would have been $3,773.98. The occupation tax on the $1 rate is, at 3%, $3,215.23, leaving the corrected net earnings $558.75. This would be a return of .085 per cent per annum on the reproduction cost of the property and a return of .098 per cent per annum on the present value of the property, taking the reproduction cost and present value as of the date of my valuation. Exhibits 103, 104, 105, 106, 107, 108, offered and received in evidence.

Cross-examination continued by Mr. Adams:

The 16% on my reproduction cost amounts to $131,632. Of this 16%, 4% is for taxes and loss of interest during construction. I can subdivide the 4% and show how much is for taxes and how much for loss of interest. I did not do it in this case but I have done it in a number of cases and find that the average is 4%. I cannot give the separate amounts now without working it all over. In making my computations I figured approximately three years to repro-
487 duce the property, and during that time I figured on doing some business in the amounts shown in Exhibit K. In working out this calculation I took each of the items of construction and determined the amount of time required but I did not keep any record of those details. The largest gas holder would take approximately nine months to a year to reconstruct. I do not think any part of the plant would take any longer than the large gas holder. However, it would not be good business to reproduce it all as fast as it is possible to do so.

I settled on three years as the proper time because that is the time you can best take care of it in commercial use. If you build all of this plant in one year you will have a large amount of capital idle without any commensurate return. I would not want that part invested until I could use it. The interest on the 500,000 foot holder will average one-half as to the period of three years. The liability or casualty insurance covers all of the items for which the company might be held responsible in the way of accidents, delays, personal injuries, fires, railroad wrecks, spoiling equipment—whatever is involved during the construction that might cost the company money. I took 2% on the total net construction cost of the property because that has been shown to be a fair average required for that purpose. I have not further subdivided it because contractors have had that experience and engineers have found that to be a fair figure. Sometimes the contractors in the contract for construction carry the acci-

dent insurance. There is no uniform custom. It is not common enough to be considered a standard practice. It has not been the practice during the last 40 years to use a lighter weight of cast iron pipe for gas mains than that on which I have estimated in this reproduction cost.

The sales that I have shown for the Lincoln gas plant since the beginning of its operation with the exception of three or four years were taken by me from the records and are the actual sales as there reported. The average length of 73 feet for services
488 from the main to meter is the result of an actual investigation made to determine that length from the records of the company. I did not investigate whether the company was the owner of the entire service pipe or not and I have included the entire 73 feet as a part of the whole which constitutes the value of the property. For a 5-light meter I figured a cost of $8.06 in place. The cost of the meter itself is the list price less 40% in carload lots, F. O. B., Chicago. That amounts to $5.40. The connections amount to $1.41. The freight on the meter will average 8.1¢; testing, 10¢; setting, 63¢; incidentals, 6.3¢; making a total of $7.68. Correcting the freight to Lincoln makes it $8.06. The method of figuring the cost of installing the other sizes is exactly the same.

The going value is that difference between the value of the existing property with all of its established relations and the value of its physical equipment alone, having no relation other than just existence. The value of the connections between the pipe and main and various buildings in the city of Lincoln is reflected in this going value, and it also takes into consideration and is affected by the fact that the company has an organization. The fact that there is an organization is one of the things that tends to constitute its value. The going value of this property is the result of many years development. It is here today and we must try to measure it. You can't go back and measure it as it has been developed from year to year and the best way that I know of is to take what it would cost to equal the going value now here, and for that reason it is necessary to take the hypothetical plant and run it into the future. It would take six years from January 1, 1913 for the hypothetical plant to catch up with the going plant and be in parallel operation. Three years of that is co-incident with the period of construction.

In estimating this going value I have accepted all of the conditions found here today, and I assume that the community is familiar with the use of gas. If I were to start in a community not familiar with it I would develop a going value enormously greater than
489 I find here. I assumed that the houses are piped for gas beyond the meter. In this $18,000 for salaries of manager and assistants in my estimate, I believe that it will fairly cover a portion of the manager's time and clerical force that is chargeable to construction during the whole period of three years. The time of the manager and his force would not be entirely devoted to construction. As the plant grows the time devoted to construction matters decreases and to operation increases. This item of value enters into

the going value the same as the main in the street enters into it. It does not enter into the going value twice.

Working capital is the difference between the credit items and debit items of all kinds that are involved in the current operation of the business. The working capital might easily have been more or less than it was the first of any year. I have found what the working capital was at the time I made the inventory and valuation and I satisfied myself that it was a reasonably fair average and that is why I have shown it here. The depreciation on the reproduction cost at the present time is $172,961, which is 18.1% of the reproduction cost minus the real estate. The present condition of the entire physical property is 18.1% less than new. The depreciation annuity on the sinking fund basis necessary to reproduce this property is $20,865.03. In this is not included any sums expended by the company for repairs and renewals because they are not a part of the depreciation.

The amounts expended for repairs and renewals for 1903 to 1912 are shown in my report in a number of different places under coal gas, water gas, and mixed gas. I am certain the company has at no time carried a depreciation reserve and also that it was carrying current amounts to the repair account and I know that that account showed no abnormal amount by carrying that way and from that I was satisfied that a depreciation allowance as I have shown here should be allowed in addition to that shown by the company's records. The fair allowances for repairs, renewals, and depre-
490 ciation on this plant is about 10¢ per thousand feet of gas sold.

If the company had wooden mains at one time there are none now. I have no record of them. Whatever they had at first I have made no estimate on them. I am making a valuation of the existing property. I have depreciated engineering, taxes, and interest which enter into and make up the 16% at the same rate and to the same extent that I have the other elements of value in the physical property and I think that should be done in estimating the present value of the gas property. I have not depreciated the organization and legal expenses. The value of the organization is here and it remains here and we presume it is going to stay; equipment will go, consequently you don't have depreciation on organization as you do on equipment.

Redirect examination by Mr. Strode:

I have run across the depreciation reserve account of $1,000 per month in the accounts of the company. It is not exactly a depreciation reserve. They call it a reconstruction reserve. It serves only one function and that is this: in the operation of the property the holders of the securities have a right to assume that the capital will be maintained intact. A company that pays dividends out of its earnings that are not sufficient is in effect paying out of the capital. This it has no right to do. Consequently a conservative manager will try to keep in mind the amount of money he should have earned to maintain his capital intact before he gets up to the point where

he would be warranted in paying dividends, and this $1,000 a month will tell the company whether or not they are really able to pay dividends.

I remember having seen in the books of the company the depreciation account that is carried in suspense. The items were not entered specifically because they didn't know the amount. It is in suspense. It was carried in suspense and did not enter into any of these calculations. Neither does this $1,000 reconstruction reserve account enter into my report nor is it in the result of the net earnings of the company. The only function it has is to tell the manager
491 whether or not he is able and has a large enough reserve to be warranted in paying dividends. I also ran across an account carried in suspense which referred to the occupation tax, and that did not enter into the tabulation of the net earnings of the company at all. If items were carried by the company into the account of repairs and renewals and should have been carried into the construction account it would tend to increase the current operating expenses and decrease the capital account. It would not affect the amount set apart annually for depreciation, however, as depreciation is beyond current repairs and renewals. No matter what the mingling of the accounts has been in the past it would not affect this depreciation.

If a man had charged to operation an item which should have gone to construction it should be corrected in the accounts of the company but it does not affect my estimate of depreciation required in the future. It might affect the result shown in my report of what the operating expenses of the company were during that period, but the gain would be in operating expenses and the loss in construction. Any item that adds to the amount of your property is an addition to the construction account. Any item that replaces another though of the same kind adds to your construction account only the excess in value over the value of the one replaced, determined by capacity or cost. If the new item costs less it would actually involve a reduction of capital though it was the installation of new equipment.

Recross-examination by Mr. Morning:

I have found nothing in the accounts of the company showing the amounts spent for repairs and maintenance that would indicate an abnormal expenditure for those items but there is quite a variation from time to time. They have not been spending sufficient money in those items to take care of the element of depreciation, and the element of depreciation should be deducted from the reproduction value to find the present value. If you were to replace a water
492 gas set that should not be charged to operation except as it goes back through depreciation. If you replace a plunger of your pump that is a current repair or renewal. If you replace your roof, that is a renewal but to replace a whole building is not maintenance. That is a replacement and should be handled through depreciation.

The item that is charged for as maintenance and repairs is the

every-day thing. That happens frequently and that should go directly into operating expenses but the cost of replacing a building should not go there. It should be handled by depreciation. I would build up in the books a depreciation reserve on the annuity basis, and out of that I would pay for such items. I would lay by each year so much money for each piece of equipment. I might invest that cash, but it would be actually available for replacing the equipment. In the absence of such a reserve the property has to suffer gradually. Had there been such a reserve there wouldn't have been such a difference between the reproduction cost and the present value.

If I found that a $5,000 or $10,000 machine had been replaced with a new machine during the current year and the value or cost of the old machine had been carried as an operating expense I would immediately deduct from my allowance for depreciation for that year the amount so taken out. If $20,000 was the amount required for depreciation and they had by this machine absorbed $5,000 I would only have the right to call for $15,000 more. They have no right to replace anything which is carried by depreciation and put in into operation expenses. Mr. Phillips said he had done such a thing as that and we are now going over the records to find out how much of that has been done. In my corrected statement of the net earnings I have worked back with depreciation deducted on the present requirements, and I said last year you should have taken $20,183 for depreciation and if Mr. Phillips absorbed $2,000 then I would say it should only be $18,000. Under my sinking fund method of handling depreciation, if a piece of equipment has assumed life of twenty years, and ten years old, that would depreciate it much less than fifty per cent in finding its present value. The rate annually deducted is lighter during earlier years than during the later years because under this system interest compounded would equalize the matter at the end of the assumed life (p. 1812).

493 HENRY I. LEA, being recalled for further examination, testified on behalf of the plaintiff as follows, pages 4192 to 4267, Vol. 4, original record:

Direct examination by Mr. Strode:

Exhibit 425 is a book prepared by me entitled Comparison of Valuation Data, Operating Statistics, etc. Section A is a comparison of the net reconstruction costs and the reproduction costs, the present value and the depreciation annuities, of the four groups of physical equipment, real estate, buildings, works equipment, and distribution system, as shown by my valuation in Exhibit 7, and Mr. Adams' valuation of January 1, 1913. The exhibit is a correct statement of the amounts as arranged by Mr. Adams' report and my net construction cost. The wording is not the same. He does not use the term "reconstruction" but he means the same thing.

In my original report, Exhibit 7, I included land at the plant which I understood was used entirely by the gas department. I learned later that it was used in part by the electric department, and

I have therefore made a proportionate deduction on that account. Also in the distribution, after my report had been filed an error was discovered in the amount of 2-inch pipe. There was more shown in the inventory than in the ground. I have made the correction throughout my entire report so that the figures in Exhibit 425 as compared with Mr. Adams' are those figures after these corrections have been made. I find the net construction cost of the real estate, buildings, works equipment, and distribution system to be $803,028.25, and Mr. Adams finds it to be $514,970. The reproduction cost of the physical equipment alone I find to be $928,423, and Mr. Adams finds it to be $551,018. The present value I find to be $760,875; Mr. Adams, $415,208. Depreciation on the four items I find to be $18,053.61; Mr. Adams, $10,905.94. Mr. Adams does not include some of the items that I include.

Exhibit 425-B shows the net construction cost, the reproduction cost, present per cent condition, present value, of each of the
494 parcels of real estate involved in this valuation and shows the relative values placed on each parcel by a report of Mr. Adams and in my report. This Exhibit was prepared by me or my assistants under my direction and I am satisfied of their correctness. They were made up from the Exhibits offered and in the record here, with the exception of the corrections made in my first report above mentioned. The net construction cost of the real estate I found to be $19,320; Mr. Adams found it to be $2,625. The reproduction cost I found to be $19,320; Mr. Adams, $2,809. The present per cent condition we both found to be 100%. The present value we found as we did in the reproduction cost. The items marked "O" for Mr. Adams indicates that he excluded those from his valuation. At least he allowed no valuation for them.

Exhibit 425, subdivision C, is a summary of the buildings involved, showing first the net construction cost given by myself, Mr. Adams, and Mr. Assenmacher. It next shows the reproduction cost given by Mr. Adams and myself. Mr. Assenmacher did not give it. The same plan is followed showing the age, life, present per cent condition, present value, and depreciation annuity of the buildings. The difference in our reproduction costs is first due to the difference in our net construction costs and in addition due to the fact that Mr. Adams adds but 7% and I add 16%. The only building which I include and which Mr. Adams does not include is the district holder and booster house. Subdivision D of Exhibit 425 shows the net construction cost, reproduction cost, age, life, present per cent condition, present value, and depreciation annuity for each of the items of works equipment, as valued by Mr. Adams and myself. I have placed a net construction cost of $218,358; Mr. Adams, on those items which he included and which are not the same throughout as mine, has placed it at $160,069. The major part that he has omitted is the East Lincoln holder. Also he has omitted a drill
press which I valued at $45, there is a number 5 Sturdevant
495 engine which I valued at $270. That Mr. Adams included with the blower. The total reproduction cost of the works

equipment I figured at $253,298, and Mr. Adams figured it at $171,-274. I get Mr. Adams' present per cent condition by dividing his present value by the total reproduction cost.

Subdivision E of Exhibit 425 shows the net construction cost, reproduction cost, age, life, present per cent condition, present value, and depreciation annuities for each of the items entering into the distribution system as shown by Mr. Adams and myself, after having corrected the error discovered in the street mains as per the testimony of Mr. Brodnax. The total net construction cost of the items I find to be $529,736. Mr. Adams finds $324,659. His present per cent condition I have arrived at by dividing the present value by the reproduction cost. The second sheet of this subdivision shows the corresponding information for street mains exclusive of paving. On the following sheet is a comparision of the paving data. This covers the cost of tearing up and replacing the street pavement only. It, I have shown, is a total of 190,037 feet under paving, while Mr. Adams has given 68,978 feet. It also shows the net construction cost and present value of paving alone as given by each of us.

Subdivision F of Exhibit 425 shows the valuations placed on the different parcels of real estate owned by the company as placed by myself and Mr. Adams. The column headed Valuation Assessed by the County is omitted. That assessment includes both the land and buildings. My figures were $21,700, which is not the revised figure. That has already been given. Mr. Adams values the same at $2,625.

Subdivision G of Exhibit 425 goes further into the details on the buildings. The first sheet is a summary of the net construction cost for the buildings shown separately and then follows a number of sheets showing the differences, if any, between the denominations and quantities as used by Mr. Adams, Mr. Assenmacher, and
496 myself in our several valuations of these buildings. The quantities, denominations, and amounts of money are shown wherever they could be separately located. The cipher under any one indicates nothing. A single star indicates that the quantity corresponding with that location on the sheet and the costs corresponding with that location as given in my valuation has been accepted by Mr. Adams. Where you find two stars that means that the item has not been included by me in my unit prices. Where you find three stars that indicates that that item is exclusive of doors and windows and means that there is nothing shown for that item by that person.

Subdivision H of Exhibit 425 is a number of sheets having to do with street main services, and meter data. The first sheet shows the width and depth of the trenches, the cubic yards of excavation per lineal foot, the cost of excavating, and refilling per lineal foot, for each of the sizes of mains here found as shown by Mr. Adams and myself. The next sheet is a continuation of the same matter showing the comparison of weights of pipe per lineal foot cost, cost per 2,000 pounds ton, F. O. B., Lincoln, cost of pipe per lineal

foot, F. O. B., Lincoln, percentage added for specials, cost of pipe per foot and specials, F. O. B., Lincoln, and storeroom cost per lineal foot for each size and kind, shown here in use as shown by Mr. Adams and myself. The next sheet is a comparison of the cost of handling and hauling and laying per foot, and all lead, hemp, and of the total lead and hemp or their equivalent, per lineal foot, and all miscellaneous items, per lineal foot, and the total cost of the pipe laid in unpaved streets, per lineal foot, for each and all of the sizes and kinds of pipe shown here, as shown by Mr. Adams and myself. The next sheet is a comparison of the street mains in the system. It shows the corrections in accordance with Mr. Brodnax's testimony on all sizes and kinds of pipe used for street mains and figures as used by Mr. Adams agree with the figures used by me as to quantities. The next sheet shows the total
497 number of house services and stub services, the total number under paving and the total number of each kind, the net construction cost laid in unpaved streets, and the percentage of total services under paving.

I do not understand how we come to differ on house services. Mr. Adams shows more than I. It shows the net construction cost of services laid in unpaved streets, given by both Mr. Adams and myself. It shows the per cent of total number of services under paving shown by me and shown by Mr. Adams. The next page shows the relative totals entering into the cost of services used by myself and Mr. Adams. It shows, for instance, the average length used by each, the cost per lineal foot in unpaved streets used by each of us, and the total cost per service shown by each — us. The following sheet is a similar arrangement of the details of the stub services. The next is a comparison of the unit prices per square yard for paving of different kinds, tearing up and replacing pavement, tearing up and replacing paving per service, the area of pavement to be cut and relaid per service. It shows the prices used by each of us. The next sheet shows the comparison of the statements as to service gain and meter gain per yard, net, in each case beginning with 1903. The next sheet shows relative details entering into the cost of meters of each and all sizes and kinds, given by each of us, and shows the freight which Mr. Adams neglected to produce.

Subdivision I of Exhibit 425 shows first the corrected gross earnings of the gas department in Lincoln alone with gas at $1.20 per thousand feet for particularly the years 1907 to 1912. In the two years before that shown there not all of the figures required were available. These are below the dotted line. All of these figures were taken from the Exhibits in this case except those which I mention as I go along. You will find reference to the Exhibit numbers in a good many columns. The next two columns show the gas actually sold in Lincoln alone in thousands of cubic feet for each year. The next shows the gas sales alone in Lincoln
498 as they would have been had gas been reduced to $1 a thousand January 1, 1905.

That column under my name shows an estimate because Mr.

Adams, in his Exhibit 347, indicated an estimate that the sales of gas would not have increased because of the reduction in price is the testimony of someone else. He does not believe that to be so and these are the figures he gave and using that there would have been an increase but he has not shown what it would be. In that respect he has been unfair to himself because he has not shown the advantages that would have arisen in carrying that to its logical conclusion. The reduction to $1 on January 1, 1905 would have in a relatively short time brought about an increase in the sale. It would not have opened up important new fields but would have increased the consumption by consumers and in the course of the three following years the consumption of gas per consumer would have so increased that the average revenue per consumer of the company would have been restored to the point it left when the reduction was made.

The average consumer will spend each year a fixed amount. If the price is reduced he will use a greater proportion, so that instead of the assumption that the volume would not increase it should be estimated that it would increase and also the operating expenses, and thereby you have increased the return which would be much greater than the increase in operating expenses. Mr. Adams said it wouldn't increase over $1.20. I have figured a much greater increase in sales at a dollar than he has. I consider Mr. Adams' presentation wholly inaccurate and in this statement I show what the correct amount is and it is to your benefit. If the gas had been sold for a dollar in 1905 the sales in 1912, in my belief, would have been 272,000,000 instead of 227,000,000 to the existing consumers. That would have yielded at a dollar practically the same amount of revenue as the actual sales did at $1.20, and there would be an increased operating expense and that increase over the actual expenses in 1912 would, in my opinion, have been $12,015.

499 The next sheet shows the total operating expenses on account of the gas sales in Lincoln alone with gas at $1.20. I have shown that in the first three columns then in the next two columns I have shown what that sale would have been throughout that period if gas had been sold at $1 a thousand. In other words, while the sales of gas would have increased, the operating expenses would also have increased. This is without considering the new consumers because Lincoln is not an industrial town and I know of no field for the use of industrial gas that could be reached by gas at $1 per thousand cubic feet that can't be reached at the present rate, and the increase would come from the present consumers almost entirely.

Now the net earnings for the gas department in Lincoln alone if the gas were $1 per thousand for those six years were a total of $404,913 against the total for those six years as estimated by Mr. Adams of $485,811, and as against the actual net earnings for those six years of $480,940 on the $1.20 rate. The corrected gross earnings of the gas department in Lincoln alone of gas at $1.20 per thousand are shown in the last sheet of this part of the exhibit in the first two columns and it will there be seen that Mr. Adams'

and my figures are the same. The total operating expenses for the gas department alone for Lincoln with gas at $1.20 per thousand is shown in the next three columns. The first column shows the amount from the gas records as corrected by me, the second shows the estimate of Mr. Adams, and the third the amounts which Mr. Adams reports as found from the company's records as arranged in his exhibit. The next heading is the net earnings of the gas department in Lincoln alone with gas at $1.20 per thousand, the first column showing the net earnings according to the company's records as corrected by me, the second showing the net earnings as shown by Mr. Adams using in part the records of the company and in part his estimate, and the third showing the net earnings as shown by Mr. Adams, which are in excess of the net earnings as shown by me in the sum of $252,572.93. My figures are based on the
500 records of the company as corrected by me for residuals for 1911 and 1912, and for depreciation for each of the six years shown.

The figures of Mr. Adams are in part an estimate. I accepted part of the expenses and on other portions used his estimate. The last column shows the total of these years. The difference between our figures is in the operating expenses due to the depreciation and correction on residuals. Mr. Adams found the same gross earnings that I found. I took the operating expenses as shown in the records and added for each of the years the depreciation and then made the correction for the residuals. The amount added to the operating expenses because of the estimated increase in sale under the reduced rate of $1 is what I believe to be the actual cost for the additional volume of gas which would be sold to existing customers. I figured the minimum amount that anybody could be expected to deliver that additional amount for. It is so low that I don't believe it could be reached except through a somewhat similar average price per thousand sold that would result from this increase in sales. My basis for my estimate of the increase of the sales due to the lower price comes from knowing the growth in sales following the reduction in price in various cities. It is a matter of general information that three years will restore the revenue caused by a reduction in price of 20¢ per thousand.

Exhibit 426 *are* the final figures of the reproduction cost and present value of the different items after making corrections for real estate and for the error in street mains. The purpose of this subdivision I of Exhibit 425 is to show what would have been the effect on the gas sales, on the gross earnings, on the operating expenses and on the net earnings of the Lincoln gas department if the gas had been sold for $1 per thousand feet since January 1, 1905, and the result is that the total net earnings would have been approximately $80,000 less than they actually were with gas at $1.20. That would have been the loss after having allowed for the full increase in sales and the increase in revenues above what was shown by Mr.
501 Adams, and the increased operating expenses as shown by Mr. Adams.

Subdivision J of Exhibit 425 is a comparison of the figures shown

by the gas company's records and by its annual reports between which there are some differences at times though in the aggregate they are insignificant. It is a comparison between these reports as corrected and the estimates supplied by Mr. Adams and the figures found by Mr. Adams in the gas company's reports for the total operating expense in money and per thousand feet sold for the years 1907 to 1912 inclusive, with the totals for the past six years, and in some cases for the items for the years 1905 and 1906. The next sheet in the same exhibit compares simply gas making materials and labor plus taxes. The next concerns the salaries, office, distribution, and general expense. These are not assembled in the gas company's reports. Mr. Adams selected the items and put them into groups of his own arrangement and I have followed that arrangement. I have gone over the books again and taken his arrangement and have found what he says is in the books and have paralle-d them. The last sheet is simply information concerning repairs and renewals.

Subdivision K of Exhibit 425 on the first sheet is a summary of the total expenses claimed by Mr. Adams to be excessive for the years 1907 to 1912. It shows that Mr. Adams claims the expenses shown by the gas company's records for gas making labor and material and taxes for those six years have been $7,742.04 more than they should have been and it also shows that he claims that the amount of money spent by the company for salaries, office, distribution, and general expenses during those six years was $168,592 more than it should have been. It also shows that the amounts spent by the company for repairs, renewals, and depreciation during those six years was $44,306.31 less than it should have been according to the records of the company, and leaving the net amount excessive, according to his contention, $132,028.13. The following three
502 sheets under this same exhibit show the details of the three subdivisions shown on the first sheet.

Subdivision L of Exhibit 425 is a still further analysis of the items comprising the total gas making labor, material, and taxes. The first sheet is a summary of the following sheets one of which is for each year from 1905 to 1912, inclusive. On these later sheets are shown for each year all the items of the company's account of money that was reported as having been spent, and the corrections, if any, made by me, and the amounts as found by Mr. Adams from the gas company's records. I have shown under a heading entitled amount spent for gas making labor, material, and taxes, each and every item in the company's records. If Mr. Adams eliminated any it will be shown as being eliminated by him and included by me. The page for 1912, for instance, shows all of the details of expense which go under gas making material and labor as shown by the company's records. Then there is shown all of the gas company's records as corrected by me if I have made any. Then is shown the gas company's records as Mr. Adams says they are, in the last column.

Subdivision M of Exhibit 425 is a treatment of the subject of salaries, office, distribution, and general expenses in the same way for each of the years 1903 to 1912. Subdivision N of Exhibit 425 is a treatment of the subject of repairs and renewals for the years 1903

to 1912, inclusive, in the same way. The exhibit will show where depreciation is included and where it is not.

Subdivision O of Exhibit 425 is a comparison for the years shown at the top of the columns between the so-called labor and materials and so-called over-head costs as shown by the gas company's records, and as shown by those records as corrected by me, and as shown in Mr. A. D. Adams's Exhibit 300, showing in the first two subdivisions the total net wages, salaries, and material in the manufacture, distribution, and sale of gas, and labor and material in repairs,
503 renewals, and depreciation. The third subdivision shows the totals of these items. The next subdivisions are the subdivisions of the so-called over-head expenses of, first, supervision, executive salaries, office rent, and incidental expenses, and next, legal expenses and, next, taxes, and showing what is the total of these items. And in the last subdivision is the total operating expenses being the total of all of the items in fractions of a dollar per thousand cubic feet of gas sold.

Mr. Adams, in one of his exhibits here, has endeavored to show the trend of the so-called labor and material costs as against the trend of the so-called over-head costs per thousand feet of gas sold, and he has shown by that that the over-head expenses per thousand feet of gas sold has been constantly increasing and he has done that throughout by attaching a classification that was satisfactory to him and which was not conclusive or fair to determine the real relation between labor and material costs as a whole and over-head costs as a whole.

It is obvious that all of the items entering into each of these general heads must be taken into account. Mr. Adams treated labor and material as confined to the plant and there is labor and material in the distribution system, in the office, and in the construction system, and there is actual true over-head expense and directing expense over and above what he purports to show. The actual facts are shown in this exhibit summing them up, and the relation of the so-called labor and material costs to the so-called over-head costs per thousand cubic feet of gas sold is shown. It must be remembeerd that this exhibit compares the results I got by talking about all material and labor and about the true over-head costs as against what Mr. Adams got by talking about labor and material at the works alone and all other expense as over-head. I have brought in the elements that should have been properly brought in and have shown them in detail. I haven't taken a part of the story.

The total net wages, salaries, and material in the manufac-
504 ture, distribution, and sale of gas, for example, in 1907 was .6315; in 1912, was .5321, showing a decrease in that total of salaries, wages, and material, per thousand feet of gas sold. And the gas company's records as corrected by me for that same item show a reduction from .6315 in 1907 to .5437 in 1912, and under the arrangement of the items shown in Mr. Adams' Exhibit 300, he shows, for 1907, .4473, and for 1912, .3239, for what he is pleased to call labor and material. In my comparison, I am not comparing the same items Mr. Adams compared. I have all of his items and

have placed them where they belong. My comparison was distinguished entirely from Mr. Adams'. Take my explanation in connection with my tabulation and you will get it correct. The same comparison is made for each of the items for each of the years throughout the exhibit. There is an increase in the total operating expense as shown by me from .1002 in 1907 to .18 in 1912 per thousand feet of gas sold. This is made up of .0219 of the increase in legal expenses; .0256 in taxes; and .0323 in supervision, executive salaries, office rent, and incidental expense. The occupation taxes are not included here.

Subdivision P of Exhibit 425 and the pages following show in a general way all the details required for the preceding table, subdivision O showing specifically the items and amounts which I have classed as labor and material and the other items which I have classed in the over-head.

Subdivision Q of Exhibit 425 relates to the Massachusetts cities. I have been more or less familiar and have studied from time to time with the public records of the Gas and Electric Light Commission of Massachusetts for the past eighteen years, and in all that time I have never been able to satisfy myself that they were records that could safely be consulted for learning specific things with relation to other properties not only because they even have failed to agree with themselves in their own reports, but on account of the very nature of their compilation. In the first place I dare say there is no record of any one company's operation in any one year in all of those records that can be competently analized and whose specific amounts can be positively shown except by the man or men who made the records of the gas company in the first instance.

505 Those men have transferred what they have drawn from the expenses of the local company and put it into the standard form of report and have submitted it to the commission. All the other companies in the state have done the same thing. Though they work under a uniform classification of accounts it is very obvious not only from the records but from the admissions of Mr. Adams that these questions are not understood generally in the same way.

Different men not only in the same town but in different towns place different interpretation and it is impossible to tell from the record exactly what is meant. That happens not only with the Massachusetts but with all holding companies. For instance, take this company and the Doherty group which has a much more elaborate and scientific system of bookkeeping than the Massachusetts commission has ever been able to obtain. From their special trained auditors and accountants and parallel system of accounts they get the best they can and all of these boys try to get into each of these accounts just what should go there but that don't mean that they all interpret the classification the same way, so that the items are grouped in here that belong here and there. Those are unavoidable things and are to be expected in any comparison of operating results. You have different men, different conditions and since the men who made these reports for the company were not available for an explanation of the items they certainly are not the best authority.

The best authority would be the employees of the Massachusetts commission whose duties it is to compare these reports, discuss them, and make analyses of them. The figures which I have shown here all refer to those Massachusetts towns first introduced by Mr. Adams. I went to the office of the Massachusetts gas commissioners and obtained the original sworn returns as presented to the commission by each of those companies for the several years from 1907 to 1911, inclusive, and because of this I have used in some of my latter comparisons the years 1907 to 1911. The detail arrangement of
506 the form used by the commission in the year 1906 and some time prior thereto is not the same as used for the years 1907 to 1911, inclusive, and the form used in the year 1912 is somewhat different from the form used in those intervening years.

I have used those five years from 1907 to 1911 inclusive because throughout that period the same classification and the same account numbers are meant to represent the same thing. I wanted to know what was all of the expenses shown, at least the part of the return to which Mr. Adams was referring, and I got that information and the thing shown by Mr. Adams in his cost does not present all of the cost in any of the six towns submitted in his first exhibit concerning Massachusetts in all of the years. In those exhibits he shows all expense except material and labor making gas, repairs, renewals, and taxes per sworn returns to the Massachusetts commissioners. Now, from the heading he has used I understood he meant all expenses except certain things and I concluded that the best source of information concerning a matter of that kind was the commission itself.

In my opinion there is no individual or body as competent in an analysis of the records of the Massachusetts matters as the man who makes and works continuously on the records of the Massachusetts commission. I had occasion, therefore, not only to refer to that one page of the large report which Mr. Adams has used but to that and all other figures shown by the commission in its own analysis of those particular things. In the single page of sworn returns which Mr. Adams has used there will be found such items as salaries of officers, general salaries, general office expenses, law expenses, claims and incidental expenses, none of which he undertakes to explain in detail and none of which can be explained from the records to which he has referred or from any other records in the office of the Massachusetts commissioners with any degree of exactness. I have
507 before me the sworn returns and it is very obvious from the analysis submitted by the commission of its own figures that there are expenses for a great many of these companies in a great many years denominated "other expenses" which are certainly no more specifically defined for the use of Mr. Adams or anybody else than the items which he has used under the caption of general office expenses, law expense, and incidental expense, and they may have been just as properly abstracted and placed here as outsiders think they should go as Mr. Adams has abstracted them. The expense called other expense, being item 29 on page 8, are not included in the total expenses but they are shown to the commission that they are a legitimate part of the operating expenses of the gas depart-

ment for the specific years and they are a part of the expenses and so recognized by the commission and are deliberately omitted by Mr. Adams from his statement of the expense.

Even in an organization conducted with such attention to detail and accuracy as the Doherty organization it is positively impossible to make the operating expenses of the several subdivisions of their own accounting system in their own companies keep anywhere within the limits of the accuracy which Mr. Adams undertakes to show has been done in Massachusetts. There are so many elements entering into the final operating results of a gas company as to make it impossible to compare any single town and it cannot be done except by one individual who is familiar with all of the details entering into those elements in each of those properties, and there is no reason to believe that any individual has any such comprehensive knowledge of the Massachusetts towns and of Lincoln so as to draw any such conclusions as that. In the first place the amount of gas sold by the company has an important bearing on its operating expenses and if you want to compare one town with another on that particular item the sales should be determined on the same relative basis. Here in Lincoln the sales of gas are to the general consumer of gas in Lincoln alone and the company is selling no gas
508 to other companies and there is no street lighting and in a comparison with Lincoln these factors in other towns should be eliminated. But the towns referred to by Mr. Adams are not except in a few instances fairly comparable with Lincoln because of the effect of a street lighting contract, of gas purchased from or sold to other companies. In some instances the effect of these factors is relatively small but in others it is considerable, but they must be segregated in order to get on the basis that the Lincoln company is on not only in the matter of gas sales but on all other matters if you are going to make a comparison that is of any value.

Subdivision R of Exhibit 425 is a statement of the percentage of wrought iron mains to the total mains in each of the towns referred to by Mr. Adams. One of the most inportant factors in the operating expense is the depreciation and depreciation, of course, is intimately related to the extent and nature of the physical equipment employed. Mr. Adams has shown the life of cast iron mains twice as great as for wrought iron mains and if there is to be any comparison of the depreciation charges proper in the six towns which he cites, unless you make an adjustment which does not appear to have been made, that relation cannot be ignored if an honest interpretation of the depreciation required is to be arrived at. In some places he excludes depreciation but he does not in his final costs. This exhibit shows, for instance, that in Lincoln the percentage of wrought mains to the total is 69.22% of the whole, and wrought mains have a larger life than cast mains. Mr. Adams says they have half the life. In Cambridge, one of the towns referred to by Mr. Adams, the percentage of wrought mains is 2.01% of the whole. In Brockton it is 4.51%; in Lawrence there is 7.70% of wrought mains; in Lynn, 11.58% of wrought mains; in Taunton, 31.60% of

wrought mains, and in Haverhill, 20.67% of wrought mains.
509 Now, such a variation in the physical characteristics of the distribution systems is an obvious thing and must certainly be taken into consideration if you are to arrive at a fair percentage for depreciation in Lincoln from the records in Massachusetts.

*Explanation of Subdivision S of Exhibit* 425.

There has been some criticism of the gas capacity of this plant. The records of the Massachusetts commission purport to show the maximum daily capacity of each of the 20 plants referred to here. I presume that the capacity is determined by finding the gross amount of gas which each of the plants can keep on making day by day. I presume they have some reserve but I don't know, so I have assumed that the maximum capacity shown in the Massachusetts returns is the absolute maximum without any reserve. That is, that every machine is running as hard as it can 24 hours a day, which is an impossible condition to maintain. If that is the basis then this plant's capacity would be 2,200 M per day. The daily average send-out for 1912 was 642,000 cubic feet per day, and the ratio of daily capacity to the average daily send-out for 1912 was 3.42 to 1. In that same year the ratio of the Lawrence plant was 3.98 to 1; in the same year the ratio of the Salem plant was 3.69 to 1; the Fitchburg plant, 4.51 to 1; if, however, the maximum capacity of the Massachusetts plants was determined as I supposed they were determined by allowing a reasonable reserve, and by daily capacity meaning that capacity which you can stand, then on that basis the daily capacity of the Lincoln plant would be its average daily send-out for 1912, which was 2.41 to 1, and on that basis as compared with the following towns, Brockton was 2.53 to 1; Cambridge, 3.35 to 1; Fall River, 2.65 to 1; Fitchburg, 4.51 to 1; Haverhill, 3.11 to 1; Lawrence, 3.98 to 1; Lynn, 2.94 to 1; New Bedford, 2.99 to 1; Salem, 3.69 to 1; Springfield, 2.63 to 1; Worcester, 2.42 to 1; all of the towns having a higher ratio than Lincoln. I show this be-
510 cause there was some criticism of the capacity of this plant and if that criticism is to be sustained by the statistics of Massachusetts I want to show those statistics. Your criticism was that we had an excessive investment in capacity and you compare the absolute daily maximum capacity of the Lincoln plant with its maximum for a single day. The "1" represents the maximum day's send-out and the 2.63 represents the amount that the plant could do*ne* on that day. That is 2.63 times as much as was sent out without a reserve. That is the relation between the absolute maximum capacity without reserve and the maximum daily send-out.

Another factor having an important relation to the costs is the gas sold per mile of main per year. In Lincoln they sold 2,187.456 M per mile of main in 1912; in Boston, 5,993.727 M per mile of main: in Cambridge, 4,696.844 M; Charleston, 4,490.444 M feet; in Fall River, 4,210.001 M feet; in Haverhill, 3,197.814 M feet; in Lowell, 3,370.618 M feet; in Lynn, 4,208.496 M feet, and so on.

There are some of the towns in there closer to Lincoln than that and are to be seen by checking the table, and on that element it is impossible to select a single town comparable with Lincoln out of the 20 towns. If I can distribute 100,000 M feet with only ten miles of mains it is obvious that my investment is going to be much less than if I have to have 20 miles and it is also obvious that my depreciation annuity in the first instance would be smaller; also the expense of meters would be less, also the percentage of gas lost through leakage and unaccounted for will be less. The extra miles of mains also increases or doubles the number of joints through which the major portion of the gas escapes. You would have double the investment in two miles that you have in one. Another very important bearing on the cost is the amount of gas sold per consumer.

In Lincoln in 1912 they sold 27,993 cubic feet of gas per consumer. There are many towns in Massachusetts that don't sell that much gas per consumer per year. Out of the 20 cities reported there are but two that sold as much gas per consumer per year as the Lincoln company in 1912, which indicates that the existing price
511 of gas is a strictly competitive price in this locality. With the condition of the fuel supply in these times the consumers find it economical to use gas at the existing price.

Another factor having a bearing and somewhat closer related to the sales per consumer is the amount sold per capital per year of population. This gives an indication as to the relative degree of saturation as it is sometimes called. In Lincoln in 1912 the gas sold was 5.095 thousand cubic feet per capital. Most of the towns in Massachusetts are in the neighborhood of that, several being above and several below, but that is a factor that has an important bearing on these matters and must be determined if any comparison is to be drawn. Now, a factor which shows very strikingly that same difference may be seen in comparing the Massachusetts cities with Lincoln, and is found in the last column showing the number of consumers per mile of main. If by running only a mile of main I can hook on 200 consumers it is obvious that my investment will be less and some of my operating expense will be less than if I have to run 2½ or 3 miles to get the same number.

In Lincoln in 1912 there were 78.1 consumers per mile of main. In all of the 20 cities referred to and reporting to the Massachusetts commission in this reference there were but two that had so small a number of consumers per mile of main and those are Newton and Taunton. Cambridge had 186.5; East Boston, 212.3; Fall River, 173.7, and so on. This very obviously required a smaller investment per consumer. All of the items in that table go to show important differences that bear definitely on the cost of the service and point out in detail a number of those differences which must be paralleled before you can consistently take the costs in Massachusetts and say that they apply in Lincoln because you happen to find them in Massachusetts. The greatest difference would be in the investment. If you are speaking of the number of consumers per mile of main you must remember in the Lincoln case that over half of

the total investment is in the distribution system and the
512 major portion of that is in the mains that have much less than half the consumers per mile that most of the Massachusetts companies do. Of course, you can't ignore the kind of main when talking about the investment.

Subdivision T is a copy of page 6 of each of the reports made to the Massachusetts commission for the years 1907 to 1911 inclusive for the 6 towns referred to by Mr. Adams, and shows that page exactly as it appears in the returns to the commission. I took them direct from the original returns on file with the commission.

Exhibit 427 is a blank form of return which was used by the companies reporting to the Massachusetts commission from 1907 to 1911 inclusive. Mr. Adams has had that shown in his totals on the items shown on page 6 of the returns, and this exhibit is not only a copy of the portion he has taken out but also all of the figures on page 6 for each of those years for each of the towns, and they show that the figures reported by Mr. Adams are not found in that page for the various years, and all of the expenses are not included. All of the expenditures on that page are not all of the expenses for either of those towns nor are they specifically recognized by the commission as expenditures for the gas department and the Gas and Electric Light Commissioners of Massachusetts, making their own analysis of their own figures don't find the same total for any of the years for any of those towns that Mr. Adams purports to find in those records and reports. The figures I have shown in this subdivision T opposite each of the items were taken by me personally from the sworn returns in the office of the Chief Clerk of the commission.

Subdivision U of Exhibit 425 shows a comparison of the figures found in Exhibits 351, 353, 355, 357, 359, and 361, submitted by Mr. Adams as showing the total salaries, office, distribution, and general expenses per thousand feet sold per year for the 6 cities of Cambridge,
Charleston, Lawrence, Lynn, Taunton, and Haverhill, as
513 against what I found in those same records interpreting them as they must be interpreted by anyone who is willing to accept the statement of the commission as shown by the analysis of those expenses. I have included one item that he has specifically omitted, called other expenses. There is certainly no place to classify this item except under the heading used by Mr. Adams. If you are abstracting from the records the items to show the total under those heads you must include the item called other expenses. You don't know what it is and I don't know any more than Mr. Adams, and he has got to include it just as much as incidental expense, but he eliminates it because he don't know what it is.

Subdivision V of Exhibit 425 shows the total costs per thousand feet of gas sold for each of the years from 1909 to 1912 inclusive, the years ending with June 30th in each case, and the results that are shown are by the analysis of the Board of Gas and Electric Light Commissioners of the returns submitted to them by the various companies. Those reports are here in the court-room for those years and they show that all of the figures shown in this exhibit are drawn from the analysis of the commission, and from no other source.

Subdivision W of Exhibit 425 first shows a comparison, in cents per thousand cubic feet of gas sold, of the net costs of material and labor making gas, plus taxes for the years 1907 to 1912 inclusive, as shown by the records of the gas company and as shown by the records as corrected by me, the corrections being in 1911 and 1912 because of the residuals, and the corresponding costs as Mr. Adams claims they should have been. Below that group of items is another group showing the net cost of labor and material making gas plus taxes for the same years for all of the towns to be found in the classification of the Board of Gas and Electric Light Commissioners as shown by the items and reports of that commission. For instance, in 1912 it shows the Lincoln Gas Company's cost per thousand feet sold, plus taxes of .3887¢; after making the correction for residuals I find
the actual cost was .4003¢; Mr. Adams, .3890¢. In that
514 same year, without taking too much time, Brockton had a cost of .415¢; East Boston, .41¢; Fitchburg, .49¢; Lawrence, .345¢; Newton, .47¢; Pittsfield, .42¢; Suburban, .50¢; Taunton, .46¢; and so on.

The relation of the costs there shown for those Massachusetts companies to the actual cost of the Lincoln company and for those costs as corrected by me and for the cost as shown by Mr. Adams is shown on the sheet following. The chart on the lower left-hand corner shows a list of the cities with numbers attached at their right, number 1, for instance, representing Boston, and the corresponding number on one of these curves beginning in the year 1909 considerably below the figure of Mr. Adams, which is a small dash line. The full heavy line is the gas company's actual records and the long dash line is my figure as obtained by me from the gas company's records in those years, for residuals only in the last two years. I have corrected for residuals and you will notice my long dash line gets above the actual records of the company because I had to add those residuals in those years. Mr. Adams agrees with the gas company for the years 1912, 1911, and 1910, and for the three preceding years he is somewhat lower. For instance, take Boston. It starts down at a trifle over 33¢ and drops in 1909 to a little over 32¢, and jumps in 1911 to over 33¢, with a slight increase for 1912.

The next typewritten sheet is a comparison showing the total repairs, renewals, and depreciation. In Massachusetts there is no statute and no generally-followed or understood arrangement concerning the laying aside of depreciation. The records of the company show in 1912 the charge of 5¢ per thousand feet sold for these items, and the records as corrected by me show for the same items 13.9¢, and the item Mr. Adams included as being correct for that year is 9¢, and in the table below will be found for that same year the figures for Brockton, Cambridge, and the other towns mentioned. Following that sheet is a printed chart giving the representation by curves of the figures referred to. In this in-
515 stance and in all of these curve representations the heavy solid line represents the records of the gas company, the long dash line shows the gas company's records as corrected by me, and the short dash line shows the figures used by Mr. Adams as being correct

for these items for those years in this locality. An examination of the table shows that in the year 1909 there were in Massachusetts, as reported in the analysis of the commission itself, towns which required a smaller amount than the 9¢ shown by Mr. Adams, and the same report shows that there were nine cities requiring a larger amount. For 1910 it shows that there were again six cities requiring a smaller expense for this item than shown by Mr. Adams, and twelve cities requiring more. I don't pretend that any of these figures for any town in any one year can be taken as a criterion and my reason, as I explained sometime ago, I think, is very fully substantiated by the form these curves take, and a casual examination will convince anyone that these costs for these companies do not run uniformly and there is no such thing as uniformity there and unless there is uniformity it is unfair and unscientific to come to Lincoln or any other town and say because they have gas companies in Massachusetts at that rate that 9¢ is right for Lincoln. The facts do not justify any such conclusion.

The next sheet is a treatment in the same manner of items coming under the general head of total salaries, office, distribution, and general expenses. That shows, for example, that the gas company's records show a cost for these items in 1912 of 31.12¢ per thousand cubic feet of gas sold. Mr. Adams says the correct figure or reasonable figure should be 12¢ per thousand cubic feet sold. The same sheet shows for that same year on the same items that Brockton had a cost in excess of 26¢; Fitchburg, 35¢; Haverhill, 30¢. In other years there are shown costs even higher than those. For instance, Haverhill. In one of his exhibits Mr. Adams shows Haverhill, in
516 some earlier years and leaves it out in later years because of the very evident reason that the expenses were larger in the later years. In 1911 the cost was 48¢ in Haverhill, and although Mr. Adams shows the cost for that year for some cities he does not show it for Haverhill. Now the lowest as well as the highest figures are in these reports. I have not omitted them, for I have shown all of the figures for all of the towns for all of the years.

In the next sheet are shown the total expenses. The records of the gas company for the year 1912 show the total expenses per thousand cubic feet of gas sold at 74.91¢, and as corrected by me, 84.98¢, and as Mr. Adams says they should have been, 59.9¢. In the same year the corresponding costs as determined from an analysis of the records of the Massachusetts Gas Commission show that Brockton had a cost of 88¢; Cambridge, 64¢; Charleston, 63¢; East Boston, 65¢; Fall River, 66¢; Fitchburg, 93¢; Haverhill, 68¢; Lawrence, 66¢; Lowell, 70¢; Newton, 77¢; Pittsfield, 84¢; Salem, 68¢; Suburban, 90¢; Taunton, 78¢; Worcester, 63¢. I have recited here only the towns which show a higher cost than Mr. Adams' figures. In the exhibit they are all given. Some of these cities have no depreciation reserve or other charge for depreciation. It is shown where it can be discovered in that analysis.

In the chart of the total costs as shown on the last sheet of this exhibit the full, heavy line is what the records of the gas company show for those several years, the heavy dash line is what I say they

were after correcting for residuals in the last two years, and depreciation for each of the years, and the short line is the representation of what Mr. Adams says should have been incurred in Lincoln during those years. That curve shows by an examination for 1909 that the cost shown by Mr. Adams which he says is the proper thing for Lincoln in that year is higher only than the costs of three towns in Massachusetts. Those towns are Boston, Fall River, and Lynn. Boston is a city larger than Lincoln, sells more gas and buys some gas. Fall River is larger and sells more gas. Lynn is also larger and sells more gas. As against that those records show that
517 twelve cities have a total cost in excess of what Mr. Adams says is right for Lincoln. In 1911 there is only one city out of the entire 20 having a total cost as low as Mr. Adams says the total in Lincoln should have been, and that city is Boston. All the others are higher. I have included in Mr. Adams' figures exactly what he has included.

Some reference has been made to the propriety of determining rates in relation to the net earnings per thousand cubic feet of gas sold. After having deducted the total operating expenses Mr. Adams has attempted to show dividends paid by certain Massachusetts companies during certain years. It is obvious to anyone who is at all familiar with that portion of the business that the declaration of dividends has very little relation to the actual earning capacity of the plant. You may earn an enormous sum of money and declare no dividends or you may as in some instances declare dividends out of money which is not earnings, having to pay it out of the capital. As a matter of fact the only comparison that can be used in talking about net earnings is to find what is the total amount of money left after the payment of operating expenses including, of course, depreciation and the amount which must be considered must be the total which is left for the payment of bond interest and the payment of dividends or for laying aside as unapplied earnings. In other words, your total net earnings above the cost of operating are all that are available for interest, dividends, or unapplied earnings, and in the same analysis by the Massachusetts commission covering those same towns there is shown for each year for each of the towns the total money available in each of the years for dividends, interest, and unapplied earnings, and the aggregate of those items is the difference between the total money taken in and the total expenses which the manufacture, purchase, distribution, and sale of gas, plus depreciation and other reserves, plus this item of other expenses which Mr. Adams has failed to show where I think it should have been shown in his general expenses. I do not know what the "other
518 reserve" means any more than does Mr. Adams. There are some things in the records that give an indication of what it is. You would think in some instances that there are employees' injuries, or benefit reserve, or perhaps old-age pensions but the records are very far from being specific.

Subdivision X of Exhibit 425 shows that for 1912, according to the records of the Lincoln Gas Co., that after the payment of all expenses for manufacture, purchase, distribution, management, and

depreciation, there was 45.48¢ per thousand cubic feet of gas sold available for dividends, interest, and unapplied earnings. After making the correction for residuals for that year and for allowance for depreciation at the figure which I have found for the Lincoln Gas Co., the items for that year should have been 32.38¢ per thousand cubic feet of gas sold. The same exhibit shows the corresponding figures in Fitchburg are in excess of 49¢; in Lawrence, 49¢; Lynn, 34¢; New Bedford, 65¢; Salem, 36¢; Suburban, 55¢; for Haverhill it was a litttle over 23¢; the preceding year, a little over 3¢, and in 1908, 28¢, and as another evidence for my preferring not to accept those records on their face, and it is only one of several, here is the record of the commission which shows its own analysis and in the year 1909 it can be found there was available from the operating returns, for dividents, interest, and unapplied earnings, combined, a sum in excess of $1.03 per thousand cubic feet of gas sold, and it can also be shown from that same analysis that that is more money that they took in from the sale of gas. Exhibit 425, and each subdivision identified, is offered and received in evidence.

HENRY I. LEA, being recalled for further direct examination on rebuttal, testified on behalf of the plaintiff as follows, pages 4304 to 4332, original record:

Direct examination by Mr. Strode:

Exhibit 428 was prepared by me and is as follows:

519 COPY OF EXHIBIT "428".

| | Full year 1912. | Full year 1913. |
|---|---|---|
| Gross earnings gas department as reported | $282,162.11 | $273,595.52 |
| Deduct receipts from gas sales outside Lincoln | 8,986.18 | 8,471.35 |
| Corrected gross earnings gas department | 273,175.93 | 265,124.17 |
| Total operating expense as reported. | 175,573.49 | 183,436.77 |
| Deduct output of gas, gas sold outside Lincoln | 1,873.62 | 2,471.92 |
| | 173,689.87 | 180,964.85 |
| Add for excessive residual credits reported | 2,722.23 | 0.00 |
| Add for depreciation (Minimum shown by sinking fund calculation) | 20,865.03 | 20,865.03 |
| Corrected operating expenses, gas department | 197,277.13 | 201,829.88 |

| | | |
|---|---|---|
| Corrected net earnings, gas department | 75,898.80 | 63,294.29 |
| Corrected net earnings, gas department in per cent of reproduction cost | 5.810 | 5.029 |
| Corrected net earnings, gas department in per cent of then present value | 6.698 | 5.801 |
| Total reproduction cost real estate, buildings, works equipment and distribution system | 976,037. | 928,423. |
| The then reproduction cost of entire property | 1,306,075. | 1,258,461. |
| The then present value of the entire property | 1,133,114. | 1,909,913. |

The date, February 14, 1914, occurring at the head of Exhibit 425 is the date on which I completed the comparison of the matters in that exhibit referring to Massachusetts and was submitted to Mr. Montgomery on that date. At that time I was still at work on the Massachusetts matter and brought the balance of this exhibit on for conference which we had at Lincoln. After February 14, I completed the balance of the Massachusetts work and brought
520 that material out here and inserted it in the same book without re-writing the letter of transmittal.

Cross-examination by Mr. Foster:

That is just to make it plain that a great deal of the work in that exhibit was performed after the date of the letter of transmittal. In my original valuation I put the total value of the real estate in at $21,700. I have reduced that to $19,320, because since making the final report I learned that the south 92 feet of the east half of lot 11, block 77, the west half of lot 11 in block 77, the south 92 feet of lot 12, in block 77, and lots 1 to 12, inclusive, in block 79, were used in part by the electric department and to those portions I credited 80% to the gas department.

521 Cross-examination by Mr. Adams:

In section T of Exhibit 425 are the copies of page 6 for each of the towns referred to by Mr. Adams for each of the years and there will be found the items which are not shown in the city's Exhibits 350 to 361 inclusive. There are two sheets for each town. It might easily be true that a portion of the sheets in this Exhibit T deal

with labor and material at works and various other items of expense, which do not appear at all in the city's Exhibits 350 to 361. I know that the figures do not agree because Mr. Adams has chosen to segregate items which he presumed he was right in doing and the records show the items put in one total in the reports of the commission and I have taken that total. In these particular sheets in this Exhibit I have shown all expenses and only those expenses which are shown on that portion of the annual returns of the gas company required by the Massachusetts commissions. That is headed "Statement of income and Expenses". I have not anywhere in Exhibit T segregated from those expenses included in the city's Exhibits 350 to 361 because it cannot be done accurately. In Exhibit 425-v you will find for each of the towns there shown for each of the years 1909 to 1912, the cents per thousand sold resulting from the addition of the item of "Other expenses" which I say should have been added to what Mr. Adams has included in items 350 to 361. I have attempted to show there all those expenses that are shown in the analysis of the expenses of those companies by the commission itself for each of the years.

In Exhibit 425-v I have taken only those items which it is evident from an examination of the analysis of the commission should be included under the heading, "Total salaries, offices distribution and general expenses" and I believe that includes all of the items included by Mr. Adams under the heading, "All expenses except materials and labor making gas, repairs and renewals and taxes, per sworn return to the Mass. commissions", with the exception of the item "Other expenses" but on that I am not sure, be-
522 cause this is my abstract from the analysis of the Mass. commission figures. All that I know about what Mr. Adams has included, is what could be gathered from his title. It says "All expenses except material and labor making gas, repairs, renewals and taxes." I have not tried to add up and tabulate all the figures appearing in Exhibit 425-v except those called "Other expenses", to see what it amounted to each year, in cents per thousand feet sold, except in so far as they are shown in Exhibit 425-T which does not include other expenses, but those are not segregated there in the form, segregated in the city's Exhibits. I have a rough working knowledge of accounting. I have compiled from Exhibit 425-v what I believe is shown by the analysis of the commission itself to be recognized and included by them as operating expenses and the total of these items is the total there shown.

In the printed form of return required by the Mass. commission, I do not find any place or heading for the entry of an item of expense which is not properly classed as an operating expense. The figures which I have drawn from the Mass. records are not taken from the form of report referred to, but are from the commissioners' own analysis of its own return, by which it does shown the item "Other expenses" as being a part of the operating expenses. The printed report of the commission showing its analysis for each of the years, contains all of the figures included in the original sworn return, but I do not know whether or not it contains any other

figures not taken from the sworn returns. The item "Other Expenses" as shown in the Exhibit 425-v for the year 1912 ending June 30, appears on page 255-a of the commissioners printed report for that year. That is the only place to which I resorted to find those other expenses for each of those years. I recently visited Mass. and the office of the commissioners for the purpose of making the compilations and finding out about those other expenses. I have been advised that the commission has printed instructions issued to the companies as to the way in which the different items of expenses are to be entered in the sworn returns and they
523 must have such instructions when they have a uniform system of accounting. I did not consult those instructions to ascertain whether or not "Other expenses" were expenses properly incurred in the operation of the gas business, because had I consulted them I would have known very little more about the actual facts. I have no information at all as to the actual expenditure represented by those items, no more than I have of the items elsewhere of the incidental expenses. If these printed instructions did not classify these items called "Other expenses" as a part of the operating expenses, it would have made a difference in my compilation and testimony here, but there is no other conclusion to draw when in their own analysis the commissioners include such items as a part of the operating expenses.

Pages 249-a to 254-a inclusive, of the printed report of gas commissioners for 1912, ending June 30, bear the caption at the top "Operating expenses". On page 255-a the caption changes to the words "Net earnings and their application" and the caption operating expenses is missing.

The printed reports contain in one volume the statements of assets and liabilities, operating expenses and profit and loss account for each company, and I looked to see, for the respective companies in each case, if anywhere in the detailed statement of the operating expenses and profit and loss account the items making up those other expenses occurred. Sometimes I found them and sometimes I could not reconcile them with the other statements in the same book, for the same year, for the same company. The item of other expenses for the year 1912 for the Cambridge Company is in cents per thousand feet sold .00537 and in money is $4,091.51. This is as shown on page 255-a. On page 58-a of the report under the heading "Profits and Loss account" there is an amount of $4,091.51 marked "Other items". Because the money happens to coincide I do not know whether it is or is not the item of other expenses. It may be. I did not compare the items shown in the commissioners analysis as to "Other expenses" with the respective operating
524 sheets of companies considered as included in the printed report of commissioners in the respective years, except to get the items of residuals.

On page 57-a of the same report there is a heading of manufacturing account and under that there is a sub-heading "Operating Expenses" and looking at that sheet of the operation for the Cambridge Company, under the heading "Operating expenses", I find

the words "Operating expenses at works for distribution management, taxes and incidentals" followed by figures in dollars and then a footing of those entries, and following that comes the statement "Income from sale of gas" followed by dollars and then "Residuals" followed by dollars and then "Other sources" followed by dollars and then there is a stated balance to "Profit and Loss" and that appears to close the statement of operating expenses as planned by the commission having to do with the gas account. Then on the next page 58-a comes the heading "Profit and Loss" account.

It did not occur to me and I did not as a matter of fact, look into the profit and loss accounts of these original returns of the company to the commission, to see if any expenses were set down there, or to see whether any expenses set down there threw any light on these items of other expenses, because I considered the knowledge of the commission concerning its own business very much more exact and comprehensive than anything I might acquire and I would rather take their statement than anything I might find by my own analysis of their figures. If they are not operating expenses, or if this heading "Other expenses" does not cover operating expenses then the accounting of the commission is wrong in deducting such expenses from total cash income, before showing what is left for dividends, interest and unapplied earnings of the property. If it had other expenses not directly and properly connected with the conduct of the gas business, such expenses ought not to be in any way considered in determining the operating expenses nor the income nor the amount available for dividends, interest and unapplied earnings of the gas business. If they pay out money for other things than the gas business that is no
525 part of the records of the gas business as such.

On page 12 of reputed copy of the return on Haverhill Gas and Light Company for the year ending June 30, 1913, there is written in the profit and loss account in ink the words "Litigation expenses $6,989.95" and I have no specific idea or opinion as to where that *tiem* would appear in the printed report of commission, if it were out. On page 128 of the report of gas commissioners of Mass. dated January, 1888, under the caption profit and loss, in Exhibit D, occur these words "Item of income and expenses not belonging to the operation of the current year, should be carried directly to profit and loss account". I know of no accounting system that has not been overruled or modified in important degrees, since 1888 and I would not consider instructions given at that time sufficiently urgent to compel an examination of the present methods, even in Mass. and had the same instructions been in effect today, I would not have carried my investigation of the nature of the so called "Other Expenses" any farther.

I have not depreciated in my value, the value represented by the cost of paving under which the mains lie in this city, and that element entering into this value is just as great as though the mains under the paving were brand new. When pipe under the paving is discontinued, the value of the paving over the pipe would disappear. That particular element of value goes out of being

at the precise moment that you discontinue that main as a part of your property. The larger consumers here in Lincoln have their effect, as they do in all other cities having large concerns, in representing the average sales of gas per consumer. I have forgotten the ratio here in Lincoln, but I have the figures if you want *you* go into them. I have not presented anywhere here the method of depreciation on each individual piece of apparatus, main and equipment, but I have shows to you the money that should be set aside each year on all of it, and I have explained the method of arriving at that, but I will not present a table showing the depreciation each year for each of those items.

526 HENRY I. LEA, being recalled for further cross examination testified as follows: Pages 3303 and 3304 original record. I know who the firm of Sloan, Huddle & Company are. They did not give me any aid in making this valuation and they had no connection with it, to my knowledge. I know of nothing they did that had any effect on anything I have done. I have not consulted with them on this case. If the officers of the company did it was not at my suggestion. I do not know whether they were consulted before I took charge or not, all I know is that they did take up with that firm something in connection with the procedure of the Wisconsin commission. They do some outside work and somebody took up some matters with them, but I don't know of anything that they ever did for the Lincoln Company.

527 W. F. BRODNAX, being first duly sworn, testified on behalf of plaintiff as follows: Pages 513 to 656, Volume 1, original record.

Direct examination by Mr. Strode:

Bethany, Pa., is my home. I am a gas engineer. In 1900 I came with the United Gas and Improvement Company of Philadelphia as a constructing engineer, and continued with them until 1906. After that I was something over two years in the operating department of the United Gas. One year at Maria, and one and one-half years at Allentown. For two years after that I was in charge of the valuation department of the United Gas. At the end of 1910, I went with J. J. White and Company, incorporated, and engaged in valuation work for them in California, and on the 10th of March of this year I came to the local company.

Our organization in California consisted of the chief engineer, an electrical engineer, myself as gas engineer and a hydraulic engineer. We made a valuation of the property of the Pacific Gas & Electric Company in Santa Fe. Then we made a valuation of another property which covered a period of nine or ten months. Then we made a valuation of the property of the San Joaquin Light & Power Company, the properties lying principally in the San Joaquin Valley. This occupied four or five months. Then we made a valuation of the properties of the Southern California, and of the Pacific Light & Power Company and I made a valuation of the water property in

Fresno, California. My work was principally in the line of gas and water valuation. In all we valued twenty-seven gas manufacturing, and twenty-three gas properties.

In making a valuation we did as I did here. I first put a group of men in the field to make a general outlay of the property. We called a property plan, showing the location of the buildings, their size, location of outside apparatus, materials and size, and located them with regard to each size. Then we took each building
528 separately and made a detailed drawing of it, and after the drawing was completed, we divided and segregated the buildings into their respective materials, known as bills of materials. These bills of materials were classified with each item of material. With the apparatus we simply listed such apparatus as was of standard build. All apparatus about which we were doubtful we made detailed drawings of the items or elements that entered into them. We procured a detailed inventory of the property as a basis for the valuation.

In making valuations I did not rely upon the records of the company. Some engineers who wish to make an easy job of it, do. What records and contracts I have used were simply for the purpose of reference after I had arrived at my own conclusion. I entered the service of Henry L. Doherty & Company of February 10th of this year. The United Gas Company of Philadelphia are both builders and manufacturers of water gas apparatus. They own the Omaha company and about sixty-three or sixty-five other gas and electric companies, among them are the properties in Philadelphia, Syracuse, Johnstown, New York, Sioux City, Iowa, Sioux Falls, S. Dakota, Kansas City, Mo., Vicksburg, Miss., Harrisburg, Penn., Des Moines, Iowa, and some plants in Florida.

My last two years with them was valuation work. I had never examined the Lincoln property before coming here to make a valuation. I had two assistants in making the inventory here. We began on the distribution and followed by an inventory of the gas manufacturing plant. As to the distribution, we first found whether or not we had any suitable map, and finding none suited to our use, we went to the city engineering department and made complete maps, taken directly from the city maps. We then started to plat the mains on the map, because the map of the mains in the company's office was not strictly up to date. From the information we had from the assisting map and record, we platted the mains upon our new map, and then checked that against a close scrutiny of the so-called work orders and records of main extensions. In some few cases
529 we found omissions which we put on the new map. This was all done under the direct supervision of the distribution department. The inaccuracy of the company's map was not due to inaccuracy, but to our inability to read the symbols. It was more a question of size than extent, and those were all checked over and the size was checked as the mains were opened from time to time to put in new services or to discover leaks. When we were in doubt we relied in a great measure upon the information of the distribution department. There were practically no book records as to the

sizes of the mains, prior to 1905. The map from which I got my information was compiled in 1905.

To get at the correct amount of mains, we used the company's map of 1905, and then we went back through the work orders for the main extensions. The work orders are in writing and signed by the superintendent of distribution. They are a direction to the foreman to construct mains of a certain size and length in a certain place. Then we ascertained whether or not the work had been done by examining the records of the foreman who is supposed to do the work. Those records are in a permanent file. If the work orders had not been entered on the map, then we knew there had been an error made and we put it on. It was very evident from comparing the map of 1905 with the work orders that the map was not complete prior to 1905. We ascertained that from the memory of the superintendent and foreman of distribution and checked their information by the fact that there was a service and light adjacent to where the main was supposed to be. We had access in doing that, to the consumer's ledger, and that ledger showed where the people lived. It is very rarely that we ever find a complete map of a distribution system. I feel that my figures are very accurate as I have used all the available means in arriving at them, and I think I have the correct figures. I do not think I have gotten too much. If there is any error it is the other way.

Plaintiff's Exhibit 8, is a tabulation of the exact number
530 of feet of different sized mains of the company in use in the city of Lincoln, January 1, 1913, and of the same thing outside the city of Lincoln, given in separate items. It was prepared by me and under my supervision. On January 1, 1913, there was in use in the city of Lincoln, 2,258 feet of one and one-quarter inch wrought iron mains. During the intermission I found we had made an error using adding machine in our total of two inch mains due to the failure to throw switch at the proper time. Correcting this error, I find the correct total of inch mains to be 315,496 feet, the error threw us off to the extent of 40,000 feet, reducing the number to 315,046. 315,708 feet of two inch wrought iron mains; 403 feet of three inch cast iron mains; 94,274 feet of four inch cast iron mains; 25,873 feet of six inch cast iron mains; 4,568 feet of eight inch cast iron mains; 9,810 feet of ten inch cast iron mains; 3,613 feet of twelve inch cast iron mains; 1,269 feet of sixteen inch cast iron main; and 1,472 feet of twenty inch cast iron mains. They have outside the city, at the State Farm, 2,010 of four inch cast iron main; at University Place, 827,850 feet of two inch wrought iron main; and 14,200 feet of four inch cast iron main. In Havelock they have 12,280 feet of two inch wrought iron main, and 8,300 feet of four inch cast iron main. Exhibit 8 is offered and received in evidence.

Exhibit 9 is identified as a map in two sections. In order to get the actual distance the scale feet should be multiplied by 1.015. This is due to the fact that in making the map it shrinks. Exhibit 9 is a map of the distribution system, and shows the location, size and length of each main. The size and kind of main is shown in the

legend. The location is shown by the streets and the length in scale feet is shown by the figures written on the map above the main. It was prepared by me and made under my direction. Exhibit 10 is a map showing the various kinds of paving under which the mains are laid. It was prepared by me and under my direction. It shows the entire paving in the city, and accurately shows the extent of the paving over the mains. We took the total paving from the city engineer's office by comparing with and checking Exhibit 10 against Exhibit 9. In this way we found the class of paving over the different mains. Exhibits 9 and 10 offered and received in evidence.

I have prepared and have here an inventory of the different sizes and kinds of gas meters in use and in stock by the Company
531 on January 1, 1913. The inventory of those in use was taken directly from the meter record cards of the company. These cards show the actual history of each meter its location and the conditions entering into its past service. If the location is changed that is shown on the card. There is a number assigned to each meter, when it is first delivered to the company, and the card and meter correspond in number. If the meter is destroyed or discarded, the card is taken out and the meter which replaces it is given a new number and card. We took the inventory of the meters in stock directly. The meters are classified by the number of lights and have identifying numbers. There were in service in the city of Lincoln on January 1, 1913, the following: 1*a*-#23; #2-11; #2*a* 15; 3 light 2783; five light 5125; 10 light 40; 20 light 54; 30 light 4; 45 light 12; 60 light 1, total 8038. Meters in stock or out of service on the same date were 1*a* 2; #2 1; 2*a* 2, 3 light 89; 5 light 131; 10 light 10; 20 light 3; 45 light 3, 60 light 1, 151 light 1, total 243. This is the same number and size of meters as was furnished Mr. Lea and shown in his report, identified as Exhibit J-11.

Exhibit 11, comprising pages 51 to 241, inclusive, contains the details of this meter inventory. It is a list of the meter record cards. The column headings on each page are the same. They are the classification for the different meters, three light, five light, ten light, etc., and the number of each meter appears under the proper heading according to whether it is three light, five light, ten light or whatever it is. We determined the actual number of meters in use by counting the service cards. Exhibit 11 is offered and received in evidence. It is found in the inventory marked Exhibit 8. This inventory does not cover any meters outside of the city of Lincoln.

I have also here an inventory of service governors in use in the city of Lincoln. The list of governors was furnished me by the distribution department. The governor is located at the end of the
532 service on the consumer's premises just ahead of the meter. They are of various sizes, three fourths inch, 1¼ inch and 2 inch, conforming to the size of the service. On January 1, 1913, there were 6,797 ¾ inch governors, 1¼ inch governors 199 and 4 2 inch governors in use in the city of Lincoln. There were in stock 284 ¾ inch governors, 34 1¼ inch governors and 1 2 inch governor, making the total number in use and in stock in the city of Lincoln

7116. There were in use on the same date outside of the city of Lincoln, a total of 170 governors. This tabulation and invenotry of service governors is identical with the tabulation of the same articles shown in Mr. Lea's report and identified as Exhibit J-9.

Exhibit 12 is a summary of the inventories of gas services in Lincoln. It shows the length of services, the average size and under what class of paving the service is located. It also shows the location, whether in Lincoln, State Farm, University Place or Havelock. Their location and the kind of paving under which they are located, is shown by the headings of the different columns in the summary. In determining the number of services under paved streets and the number under unpaved streets, we took the total number of mains in feet and divided that by the total number of services which gives us the average distance from center to center, between the services. Then we took each class of paving in feet and divided that by the average distance from center to center between the services, which gives us the number of services under each class of paving. The method of determining whether the services are under paved or unpaved streets is theoretical. The total number of the services was furnished us by the superintendent. Under this method we lost considerable service under pavement as by far the greater majority are located under the paved streets where the consumers reside. Exhibit 12 is offered and received in evidence. Exhibit J-8 of Exhibit 7 being Mr. Lea's report corresponds with Exhibit 12 as to the number of services and where located.

533 I have also a list of the number of service boxes and cocks. They are located just inside of the curb line and are cocks on a line with a pipe that goes down in order that the gas may be easily turned off in case of an emergency. One is supposed to be located with every service so that if a man doesn't pay his bill, we can turn the gas off. On January 1, 1913, there were 6149 of the service boxes and cocks in Lincoln. They are also referred to in the same manner in Exhibit J-10 of Mr. Lea's report.

A street main drip is a low place in the gas pipe into which the condensation in the pipe drains. They are of different styles of construction; some are known as syphon drips and sometimes they are merely an enlargement of the pipes. They are pumped periodically in order to avoid a stoppage of the mains. They pump them by running a pipe down through the drip pipe, which goes nearly to the bottom and then attach a hand pump to that. For a 20 inch main, they are from 24 to 26 inches on the inside and three or four feet deep. For a six inch main, they are eight or nine inches in diameter and from two feet to two feet six inches deep. The street main valves are for the purpose of controlling certain points of the system of distribution so that a particular district can be cut off from the mains if necessary, without cutting off the balance of the service. The district governor is for the purpose of control-ing the pressure of the gas as it is delivered to the consumer.

The railway crossings referred to in Exhibit J-5 are the places where the mains of the company are laid under the tracks of the street railway and steam railroad and show the extra labor and cost

of putting the pipe under those crossings by reason of their being there. I procured an inventory of the drips, street main valves and railroad crossings and the district governor as of January 1, 1913, from the records and maps of the company. The inventory of the drips was taken from a drip register in which the drips are definitely
located. The inventory or tabulation, Exhibit 13, does not
534 show the location of the drips but shows the number and
size. It was prepared by me. The inventory of the street main valves is shown in Exhibit 14. I prepared it from the valve map which is one of the permanent records of the company and it can be checked as to its accuracy. This Exhibit shows the number and size of the street main valves in use on January 1, 1913. The company records show the location of the different street main valves so that its accuracy can be determined. Exhibit 13 and Exhibit 14 offered and received in evidence.

Exhibit 15 is a tabulation prepared by me of the railway crossings, the number was determined by the location of the mains as shown in our map, and checking against that the location of the steam and street railways. The correctness can be determined by going out and checking the location of each crossing. On January 1, 1913, there was a total of 342 electric and steam railway crossings in the city of Lincoln. Exhibit 15 shows in addition, the crossings outside of the city of Lincoln. There are a total of 19 outside. Exhibit J-5 of Exhibit 7, Mr. Lea's report, contains the same information which I have given in Exhibits 13, 14 and 15, with respect to street main drips and valves, district governors and railway crossings.

In making the inventory of railway crossings, I did not make any effort to determine whether the railroads had been out there before or after the gas mains were constructed. The district governor is located at 33rd and Holdridge. This completes the inventory of the distribution system.

I made an examination of the buildings in use in connection with this property, on January 1, 1913, and found that they had a purifying house, meter repair shop, booster house, retort house, old generator house, new generator house coke shed, stable and smith shop, oxide house and oil house. I made an inventory of these buildings
and the details of their construction and in doing so made a
535 property plan showing the location and size of each building.
Then I took each building separately and made scale drawings with such transverse and longitudinal sections and plans as I deemed necessary for our work and after I had completed the drawings of each building I summarized the materials in each by making bills of materials. We would begin with the excavations and show how much there was of that, then the footings, basements, cellars, etc., and after that was completed would take the foundation, showing the kind of material and the quantity. Then I took the walls themselves, secured the dimensions and determined the quantity and kind of material in them; in the same manner I took the roof and trimmings. Then I took the floors, giving the dimensions, quantities and kinds of material, and then I took the fixtures of each building, such as permanent racks and I believe my inventory of the

building material is correct. In determining the quantity of material, for instance, brick in any building, we determined first the number of brick that would occur in a wall of given dimensions and then applied the result to the dimensions of the wall under consideration and we determined as accurately as it was possible to determine in each instance, the number of brick in each building. All of the materials entering into these buildings was determined by its quantity and character.

The details of the materials in each of these buildings are shown in the inventory. The details of the materials shown in my inventory of the purifying house, are shown in Exhibit 16 which is identical with Exhibit 7-B-2 Mr. Lea's report, with the exception of the toilets, which are not included in Mr. Lea's report, through an oversight. The entire outfit of toilets in this building are worth from $65.00 to $70.00. I determined the quantity and character of the materials in this building by being actually on the ground and taking the measurements with my assistants. Exhibit 16 is offered and received in evidence.

536 Exhibit 17 is an inventory of the materials, showing the character and quantity entering into the construction of the generator house. They are identical with the items shown in Mr. Lea's report, Exhibit B. The painting is now shown in this inventory. In determining the number of brick in the pilasters, we stripped them away from the wall to get their dimensions as a separate segment or portion of the wall and determined how much brick there was in that. The doors and windows are counted and reduced to square feet. The floors are measured and reduced to square feet. We measured the dimensions of the roof and got the amount of material in that. We got the dimensions of the excavation by measuring the depth of the building itself, in the ground. In getting at the quantity of brick in a wall, we do not deduct for window- unless they are larger than 12 x 12 for it is the rule that the cost is as much to build around these openings as it is to supply the material for them. It is the ordinary practice among contractors to figure the openings solid. Exhibit 17 is offered and received in evidence.

Exhibit 18 shows the details and quantities and kinds of materials used in the construction of the retort house, made by me from an actual inspection, measurement and inventory of that building, and it checks out with the details of Mr. Le-s's exhibit B-4. Exhibit 18 is offered and received in evidence.

Exhibit 19 was prepared by me and is an inventory and statement of the dimensions, quantity and size of materials entering into the construction of the meter shop and booster house. It was prepared by me and checks out with the materials shown in Mr. Lea's report for the same building, with the exception that it shows separately, 38 yards of concrete for concrete forms, which was absorbed by Mr. Lea in his actual item of concrete. Exhibit 19 is offered and received in evidence.

Exhibit 20 is an inventory showing the dimensions, character and quantity of materials entering into the construction of the coal shed.

It was made by me and checks out with Mr. Lea's report shown
537 as Exhibit B-6 for the same building. Exhibit 20 is offered and received in evidence.

Exhibit 21 is an inventory of the dimensions, quantity and character of materials entering into the construction of oil tank house. The building is entirely under ground with the exception of a one foot wall that comes above the foundation. It was made by me and the same details are shown in Mr. Lea's report as part of Exhibit B-7 for the same building. Exhibit 21 is offered and received in evidence.

Exhibit 22 is an inventory of and shows the dimensions, character and quantity of materials entering into the construction of the Oxide shed and corresponds with the items of materials shown in Mr. Lea's report as Exhibit B-8 for the same building. It was prepared by me. Exhibit 22 is offered and received in evidence.

Exhibit 23 is an inventory of the dimensions of and character and quantity of materials entering into the construction of the stable and blacksmith shop. It was made by me and corresponds in details with the report of the same building shown in Mr. Lea's report as Exhibit B-9 with the exception that the painting is left out of Exhibit B-9. It was made by me. There were 1,310 square feet of painting on this building of a value of about $300.00. Exhibit 23 is offered and received in evidence.

Exhibit 24 is an inventory of the dimensions, character and quantity of materials entering into the construction of the booster house, at the district holder. It was made by me and corresponds in detail with the tabulation for the same building shown in Mr. Lea's report and identified as Exhibit B-10. Exhibit 24 is offered and received in evidence.

I have here also, the original field notes showing the details of these buildings and the materials entering into their construction and they are here subject to inspection by counsel for the city and will be here during the progress of the trial. This completes the inventory of the buildings.

538 I have made a complete inventory of the works equipment of the company as of January 1, 1913, and I have here a compilation showing the character of the different machines and appliances and equipments carried under the head of works equipment. It was made by me and under my direction, at the plant where the machinery and equipment is located. I believe it to be absolutely correct. It was made under my personal supervision and I made the inventory of the apparatus myself because I know something about the history of the different classes of apparatus that are used in gas manufacture, and I can go back in the history of a great many machines and tell what their origin was. This, a man with less experience would not be able to do. I would be able to look at a piece of machinery without any name or identifying number on it and could tell the makers of it by simply seeing it.

The original field notes are all bound together and will be here during the course of this hearing and at all times are offered to the inspection of the counsel for the city. I have the following list of

apparatus: 1 seven foot six inch Western Gas Water Gas Set, which is the same in all details as that referred to in Mr. Lea's report, Exhibit I-2. A second seven foot six inch Western Gas Water Set, which is the same in all details as described by Mr. Lea in his report and identifying his Exhibit I-3, with the exception that I have shown the items of expense for concrete forms separately, while that is shown in Mr. Lea's report as of concrete. He does not separate the forms from the other concrete. I have the condenser and scrubber referred to in Mr. Lea's report and identifying his Exhibit I-4. I have the operating floor which is referred to in Mr. Lea's Exhibit as I-5 and checks with his in all details. The condenser and scrubber are ordinarily considered a part of the water gas set, but when we estimate and consider a set we usually speak of four shells enumerated first. It is merely a matter of convenience. The Water gas set primarily consists of these four shells. I have also a six foot
539 six inch water gas set, capacity 30,000 cubic feet per hour, which is the same item identified in Mr. Lea's report as Exhibit I-6 and checks out in each detail. I have also a six foot six inch springer water gas set, capacity 15,000 cubic feet per hour, which is the same as that identified in Mr. Lea's report as Exhibit I-7 and checks out with that in every detail. I have the operating floor, which is identified in Mr. Lea's report as Exhibit I-8 and checks out with his report. The operating floors are not treated as part of the cost of the buildings but have been seggregated. They are a part of the works equipment rather than a part of the building. I have the seven Sturtevant belted blower, which is the same as that referred to in Mr. Lea's report and identified as Exhibit I-9 and checks out with that report. I have another No. 7 Sturtevant belted blower, which is the blower identified in Mr. Lea's report as Exhibit I-10 and checks out with that report. I also have the No. 1 Root double impellor blower which is the same item as that identified in Mr. Lea's report as Exhibit I-11 and checks with that Exhibit. I have the Turbo blower unit, which is the same blower that is identified in Mr. Lea's report as Exhibit I-12 and checks out with that Exhibit. I have also the No. 8 Sturtevant Booster, which is the same item that is referred to in Mr. Lea's report as Exhibit I-13 and the details check with it. Also a No. 6 Root Exhauster which is the same item that is referred to in Mr. Lea's report as Exhibit I-14 and checks with it. I also have the No. 6 Sturtevant fan type which is the same item as identified in Mr. Lea's report as Exhibit I-15 and checks out with it. I have a McKinzie exhaustor identified in Mr. Lea's report as Exhibit I-16 and checks with it. I have the steam engines identified in Mr. Lea's report as Exhibit- I-17, I-18, and I-19 which check out with his statement of them in every detail. I have the two motors, identified in Mr. Lea's report as Exhibits I-20 and I-21 which check out with his report in every detail.
540 I have the counter shafting which checks out with Exhibit I-22 of Mr. Lea's report in every detail. I have also all of the items identified in Mr. Lea's report as Exhibit I-23 and representing apparatus of the gas generating sets combined, and my in-

ventory checks with Mr. Lea's report. Mr. Lea's Exhibits I-24 operating floor, checks in every detail with my inventories.

The items identified in Mr. Lea's report as Exhibits I-25, I-26, I-27, I-28, I-29, I-30, I-31, I-32, I-33, I-34, I-35, I-36, I-37, I-38, I-40, I-41, I-42, I-43, I-44, I-45, I-46, I-47, I-48, I-50, I-51, I-52, I-53, I-54, I-56, I-57, and I-58, all check out in every detail with the items in my inventory, and I have identically the same items of machinery and details of construction which he has. The Gardner duplex pump identified in Mr. Lea's report as I-39 I have the same item he has except there is a foundation of brick here, 152 brick. Mr. Lea has omitted that. On the items identified in Mr. Lea's report as I-49 I have in addition to Mr. Lea's items, the hot plate and clock which Mr. Lea does not have. In the item identified in Mr. Lea's report as Exhibit I-55 my inventory checks with him with the exception of three-tenths of a cubic yard of concrete. Item I-54 identified in Mr. Lea's report and covering the water piping, checks in every detail with my inventory in determining the quantities of water piping used in and about the plant; on account of complicated conditions of the water piping in the various buildings, instead of taking them off in the regular line of tabulations, we diagramed all of the pipe in the building and gave the number of feet and size of pipe and it gives us a positive check so that we can go back over the account in perfect safety check ourselves if we are in doubt. The pipe outside of the building can be handled differently by making a property plan. Items identified in Mr. Lea's report as Ex-
541 hibits I-60, I-61, I-62 and I-63 are identical with my inventory and checks out accurately. In the item identified in Mr. Lea's report as Exhibit I-64 tar piping, my inventory checks with Mr. Lea's with the exception of one lineal foot of one inch pipe, which Mr. Lea has omitted. Items identified in Mr. Lea's report as I-67, I-68, I-69, I-70, I-71, I-72, and I-73 all check out with my inventory, and Mr. Lea's report and my inventory are the same. My inventory of these items identified in Mr. Lea's report as items I-2, to I-73 inclusive, with the exception of items I-65 and I-66 cover inventory of works tools and office furniture and fixtures are covered by my inventory identified as Exhibit 25 to 54 inclusive.

W. F. BRODNAX, recalled for further direct examination. Pages 696 to 715, original record.

Direct examination by Mr. Strode:

The gas company occupies 10,650 square feet in Lots 11 and 12 Block 77 and there are 126,000 square feet in Lots 1 to 12 Block 79 which includes one-half of the street on the North side and one-half of the street on the East side of the Block, which has been vacated by the city. The ground is shown on plaintiff's Exhibit 16 which is a plat, M street is vacated on one side and 3rd street on the other. The dimensions shown on Exhibit 16 of the lots includes one-half of the street. On the valuation given by Mr. Reed, Lots 11 and 12 in Block 77 would be worth 8 4/10 cents per square foot, giving a total value of $856.00. Lots 1 to 12 on the valuation of $4,000.00

per acre given by Mr. Reed, would be 9 18.100 cents per square foot or a total value of $11,569.00 for the ground alone, making the total value of the property in the two blocks $12,423.00. Those are the same lots that are referred to under subdivision G of Mr. Lea's report, identified as Exhibit 7. He shows their valuation to be
542 $11,900.00. On Exhibit 9 the figures between the arrow heads along each of the mains indicate the distance in scale feet. We have also indicated on Exhibit 9 in red, consumers on certain of the stub ends. In order to determine whether or not there was a consumer there we went through the consumer's ledger and found the house number which would correspond to the street and to the nearest point to the dead end of the main. We took every stub end and located a consumer from the books of the company. Exhibit 10 is the paving map and shows the number of scale feet of mains under the different kinds of pavement. The figures are indicated between the arrow heads and are correct as to mains under paving.

Cross-examination by Mr. Foster:

On the East half of Block 79 there is located the Meter repair shop, the 200,000 and 100,000 holder and the Oxide shed. We made no excavations to determine the size of the mains in making this inventory. Our information came from the superintendent of the distribution and the street foreman principally, and also from the original map of 1905. I simply used this map which was supposedly correct and checked that against the work order and saw that practically everything that had been constructed of recent date had been entered. When I made the check I found a few instances where there had been omissions, where the work orders had not been properly entered on the map and I corrected those; and in a few instances where the street foreman actually knew of the existence of a main which had been overlooked, we entered that. I did not keep any record of the corrections which we made. The work order gives the length and size of the main, and we entered that directly on to the map. We went over all of the work orders to see whether or not they had been entered on the map. A good deal of that was done by my assistants under my supervision. The points to which the mains are to be extended are definitely stated on the work order and
543 by comparing that to the map you can tell whether or not it has been shown on the map. The map shows the location of the stub end so that you could go out and dig at that point and find the end of the stub. I considered the main map and the information secured from the foreman to be more reliable than the companys' report and inventory of its mains. On D street the map shows 690 feet less of four inch mains than my inventory and a difference of 80 feet on the two inch mains, making the total difference of 770 feet on D street. On 18th street, the inventory shows 270 feet more of all kinds of mains than the map.

W. F. BRODNAX, recalled for further examination, pages 717 to 730 original record:

Cross-examination by Mr. Foster:

As shown by the map there are 7200 feet of four inch pipe on P street and the inventory shows 7460. On R street the map shows 11,135 actual feet and the inventory shows 10,970. We did not consider abandoned mains. That question has never entered into our calculations. I was unable to find anything in the company's records indicating or showing the taking up or abandonment of any mains. We knew that the mains that we did take were in active operation from the fact that there were services connected and consumers were burning gas. I know of no mains that were not in active operation. It is very likely that the street foreman, if he laid any main, would remember as well as any one where the main is and the extent of it. Exhibit 9 shows 452,467 scale feet of mains in the city of Lincoln. The actual distance in miles is 98.84 miles inside and outside of the city; 86.98 miles inside and 11.86 miles outside. That is arrived at by taking the sum of the figures on the map and multiplying by 1.015. I have not shown, in this inventory, anything in the way of service pipes or mains paid for by private parties.

Exhibit 9 shows the mains in service on January 1, 1913.

544 I got the size of the mains from the existing map and from the fact that the street foreman is constantly uncovering pipe and attaching services and looking for and testing for leaks. The number of services was secured from the manager's monthly report, which began in 1902 I think. It shows the number of services installed that month and the number installed prior to that time. From the manager's report I found that over 90% of the services in the city were one and one-fourth inch. I have only taken the services shown in the report to be in actual operation. If any have been abandoned they would have been deducted from that number by the person making the report. I did not inventory the stop boxes. The average length of the services in Lincoln is 73 feet. The manager's report shows the total length of services for each year and shows the total number and gives the average length and we arrived at the average for the whole time by taking the average of the total years and averaging that. In doing this we considered that the company's pipe ended at the consumer's meter. I did not furnish Mr. Lea with any figures as to the depths of the mains or services. He procured that for himself while he was here. I gave him the total amount of paving over mains, and I gave him the number of the street and railway crossings.

W. F. BRODNAX, recalled, testified on behalf of the plaintiff as follows: Pages 838 to 841, original record.

Direct examination by Mr. Strode:

The discrepancy of 600 feet between the map and inventory on D street to which Mr. Foster called attention, is probably due in a limited degree to the transposition of the paving to the mains, for in-

stance, on D street the actual amount of paving which we attributed to that street was probably in excess of what was there, and the excess on D street was taken away from some other street in the transposition.

545 Exhibit 21 shows the actual distance in feet on each and every street in the city of Lincoln and gives the total number of feet as shown on Exhibit 9 for each street, and paralleling that is a tabulation showing the number of feet shown in our inventory and the two figures agree. If it shows 600 feet short on a certain street on the map, it will show where the 600 feet are picked up in the other side. While the map and tabulation do not agree on each and every street, they do agree when we take all of the streets together. Exhibit 21 is offered and received in evidence.

W. F. BRODNAX, recalled for further direct examination, pages 1112 to 1133 inclusive, original record.

Direct examination by Mr. Strode:

Exhibit 65 is a compilation of the cost of the buildings shown in my inventory, taking into account the quantities and character of the materials from the unit costs given by Mr. Davis and shows the amounts estimated and the total amounts in dollars for each of these buildings on that unit price. It shows in detail the character and quantities of materials and shows what unit price is applied to each, and I have shown in this compilation the construction cost of these buildings as given by Mr. Lea in his report, and in a parallel column I have given the construction cost, taking the unit cost furnished by Mr. Davis. This was done by me and my engineers under my supervision. We used Mr. Davis' units with the exception of the unit on excavation. On that we used the unit cost given by Mr. Malone On the purifying house Mr. Lea's net construction cost was $16,620.00. The net construction cost according to Mr. Davis' figures was $18,426.00 or a difference of $1,806.00.

546 On the reproduction cost Mr. Lea's is $19,279.00 while Mr. Davis' is $21,374.00 or a difference of $2,095.00. On the generator house Mr. Lea's net construction cost is $3,738.00, Mr. Davis' $3,902.00, a difference of $163.00. The reproduction cost, Mr. Lea is $4,337.00 and Mr. Davis' $4,526.00 a difference of $189.00. Of the retort house, net construction cost, Mr. Lea $7,689.00, Mr. Davis $8,340.00, a difference of $651.00. The reproduction costs, Mr. Lea $8,919.00, Mr. Davis $9,674.00 a difference of $755.00. On the meter repair shop, net construction cost, Mr. Lea $2,016.00, Mr. Davis $2,846.00 a difference of $230.00. Re-production cost, Mr. Lea $3,035.00 Mr. Davis $3,301.00 a difference of $266.00. On the coal shed net construction cost, Mr. Lea $1,793.00. Mr. Davis $1,901.00 a difference of $108.00. Reproduction cost Mr. Lea $2,000.00 Mr. Davis $2,205.00, a difference of $125.00. The oil tank house, net construction, Mr. Lea $1,558.00, Mr. Davis $1,700.00 a difference of $142.00. Reproduction cost Mr. Lea $1,807.00, Mr. Davis $1,972.00 a difference of $165.00. For the outside shed, net construction cost, Mr. Lea $60.00, Mr. Davis $63.00, a

difference of $3.00. Reproduction cost Mr. Lea $70.00, Mr. Davis $73.00, a difference of $3.00. For the stable, net construction cost, Mr. Lea $818.00, Mr. Davis $899.00 a difference of $81.00. Reproduction cost, Mr. Lea $949.00, Mr. Davis $1,043.00 a difference of $94.00. Booster house, net construction, Mr. Lea $721.00, Mr. Davis $691.00, a difference of $30.00, in favor of Mr. Lea. Reproduction cost Mr. Lea $836.00, Mr. Davis $802.00 a difference of $34.00 in favor of Mr. Lea. The total net construction cost of these buildings, Mr. Lea $35,614.00, Mr. Davis, $38,768.00. Mr. Davis' net construction cost being $3,154.00 more than Mr. Lea's. Reproduction cost, Mr. Lea $41,312.00, Mr. Davis $44,970.00. Mr. Davis' reconstruction cost being $3,658.00 more than Mr. Lea's. Exhibit 65 offered and received in evidence.

547 If the meters in stock were apportioned, according to consumers, between those in Lincoln and outside of Lincoln, 4% of the 243 meters in stock would be apportioned to those outside of Lincoln, which would amount to less than $50.00 and all items carried in stock would bear out in about the same proportions.

Cross-examination by Mr. Foster:

I secured the ages of the various pieces of apparatus making up the works equipment from the chief engineer of the electrical plant and the foreman of the gas plant. I did not make any check of the company's books. The ages shown in Mr. Lea's report are the ages which I furnished him. I included in the inventory everything that the company owned, some of it was not in use, but I considered it useful and could be used, it being held in reserve.

Exhibit 66 is a plan showing the location of the various pieces of apparatus, but it is not connected except those connected by belts. The piping is not shown. The total gas apparatus is located principally in the south end of the purifying house. In the same room with the coal gas apparatus, is located one Sumner & Sayre 4 x 6 x 5 scrubber, 1 Roots positive No. 1 blower, 1 Sturtevant No. 6 Exhauster, 1 Sturtevant 5 x 5 vertical engine, 1 McKinzie exhauster, 10 inch connections, 1 Greenfield 4 x 5 vertical engine, 1 Root No. 6 exhauster, 1 six foot station meter, 1 6 x 4 x 6 black duplex pump, 1 condenser 4 x 6 x 25 feet, 1 scrubber 5 x 6 x 31 feet. The booster No. 3 exhauster and No. 5 is held in reserve for No. 3. It is, in other words, an alternate and the No. 4 and No. 6 engines are the driving units for these two exhaustors. The exhaustors are directly connected with the water gas apparatus by a line laid from the relief holder through the purifying boxes to the storage holder. The water gas goes first into the relief holder, thence through the ex-

548 haustor into the purifying boxes, and then into the storage holder. I do not know what connection the meter has with the water gas apparatus. The coal gas retorts are in the retort house at the west of the apparatus in a separate building. The six foot eight inch Western Gas Company and the six foot six inch springer gas sets are in the north end of the retort house, and the two 7 foot 6 inch Western Gas water sets are in the generator house. They are the

ones in operation. Those in the retort house are not used at present. The two sets of water gas machines are connected with each other and both are directly connected — the relief holder. As soon as the gas is made in the water gas sets, it is driven at once into the relief holder and from there it is sent through the various gas apparatus into the storage holder. The blowers for the water gas machines in the retort house are located in the generator house.

The No. 7 Sturtevant blower is in an annex to the retort house and supplies air to the six foot six inch western and the six foot six inch springer. In the same place is located a combined Knowles 6 x 10 x 5 x 10 pump. I think that pump is there as a circulating pump between sets of 7 foot 6 inch western gas. There is nothing else in the retort house except condensers and scrubbers which belong directly to the water set. The various circles there indicate the various generators, carbureters, super heaters, scrubbers and condensers, forming practically the same series as we have in a generator house. The two water gas sets and apparatus in the retort house are held in reserve. The scrubber and condensers in the extreme south end of the purifying house are also held in reserve. They can be used in connection with the water gas machines in the generator house. In the generator house there is one scrubber and one condensor. There are two scrubbers and two condensers carried with the water gas apparatus in the retort house, making a total in all of four scrubbers and four condens*ors* in the entire plant.

549 I and my engineers made the measurements for the foundation for the 27 foot 6 inch water gas sets, set forth in Exhibit 7-I-2. In estimating the excavation for the foundation. I used a one foot clearance around the footing of the foundation and sloped the bank on an angle of thirty degrees. By clearance I mean I took one foot from the foundation to give room for the work in order to get in the forms for the foundation. In estimating the depth of the excavations and foundation on the gas company premises, I considered the fact that when they dug the foundation they had to dig down to suitable earth to maintain it. The fact that there has been considerable filling there does not enter into it. The depth of each foundation is shown in Exhibit 7.

The Knowles duplex water pump shown in Exhibit 7-I-38 is a circulating pump used in connection with the circulating system of the two seven foot six inch water gas sets, which are carried in use. Of the works tools I made no seg*g*regation between the electric and gas department. The list was furnished me by the company. I could not say positively whether any of them are used by both departments. The building at 14th and O is used by both departments, in what proportion I do not know. I did not show it in the inventory. There is a repair shop in that building and both electrical and gas apparatus*es* use that. I made no division of the tools in that shop and don't know what the division ought to be. I think I have enumerated everything that is used, outside of office furniture and fixtures. The piping for the steam and gas mains is about the same. All of the steam pipe they have is known as common black pipe and I think it is the same kind they use for mains. It is a steam pipe.

A different name is applied to it in the inventory books because we have a greater number of fittings.

550 The pipe is cut into shorter lengths for steam piping. I think Mr. Lea furnished the number of fittings per one hundred feet. He gave the unit cost. The coverings for the steam piping in the gas company plant I think is 85% magnesia and asbestos. That is the difference between covered and uncovered steam pipe. I think the same class of piping is used for that piping as in the gas mains. The only thing that would make it more expensive is the additional number of short pieces. We usually estimate the fittings on averages. Mr. Lea estimated them in this case. I just furnished the total length in feet of pipe. It usually takes the same number above as below ground for such pipe. The steam pipe costs more than the gas pipe under ground, because of the excavating. I do not recall the depth assigned to the steam pipe. There must have been an average depth assigned to it. It might be shown under notation furnished Mr. Lea, I don't remember.

Redirect examination by Mr. Strode:

In looking over Mr. Lea's inventory, I don't think there was anything furnished him for the valuation of the gas property that is used or to be used in the electrical department. Mr. Lea made an apportionment of any property that was used jointly, such as office furniture and fixtures, and as far as I know there has been no attempt made here to slip into this report any property belonging to the electrical department, as a part of the gas department's property.

Recross-examination:

I had nothing to do with the apportionment between the two departments.

551 Redirect examination by Mr. Strode:

As far as machinery is concerned, I had nothing to do with determining what the machinery was used for. It was my sole duty to know that it was there and located in the building.

552 W. F. BRODNAX, recalled for further cross examination, testified as follows: Pages 756 to 762 original record.

Cross-examination by Mr. Foster:

I have not located the railway crossings nor do I have any information showing how many were actually paid for, nor do I have any information showing the amount of pavement actually taken up and relaid over any of the mains. Mr. Lea's report shows 95.29 miles of main, while my map shows 86.98 miles of main. I have not worked out the difference, but there was an error made in the total given Mr. Lea, principally in the two inch mains. There was only a variation of one foot in the six inch mains, and of the four inch mains, four feet. The meters and service governors in stock in

Lincoln are carried both for the plant in Lincoln and outside of Lincoln. I secured the inventory of the main valves from the map of them in the boxes of the company. I arrived at the quantitity of material in the buildings by first making a drawing of the building and then securing the necessary dimensions and taking the material off in the form of the bills of material classified according to the classes under which they belong.

W. F. BRODNAX, recalled for further cross examination, testified as follows: Pages 804 to 811 original record.

Cross-examination by Mr. Foster:

I kept no separate notations of the additions which were made to the mains shown on the map dated 1905. The changes were not made on that map, however. It was an original tracing. If you check that map against Exhibit 9 you can tell what additions have been made in the company's inventories.

The item of railway crossings represents the actual expense required in laying the mains under the crossings. You have
553 to put longitudinal stringers at the ends of the ties in order to support the track during the time you are placing the pipe in and in addition to that there is usually required a watchman to see that the road continues safe while the work is going on and to supervise the work. That also represents the inconvenience and additional expense required in making joints underneath the tracks and delay caused by the movement of trains back and forth over the track. The pipes are twelve feet long and the tie is eight feet long, and if the joint comes under the track it is very inconvenient to make it. I do not know how many of the crossings in Lincoln have joints under them. I had nothing to do with preparing the estimate of these costs. All I did was to furnish the number of crossings. There is nothing in the nature of special construction detailed to me, of the crossings enumerated by me. In preparing Exhibit 9 such additions that we made on information received from the superintendent of distribution or the street foreman, were made directly on the map while in the presence of these men. They were the last resort. The legend on the tracing of 1905 showed the material of which the mains were constructed.

W. F. BRODNAX, recalled for further cross examination, testified as follows: Pages 1584 to 1633 original record.

Cross-examination by Mr. Adams:

In making the inventory of the mains, I examined the book records of mains in a general way, but I considered the map of 1905 a better basis. On January 1, 1914, my inventory shows 2,238 feet more of 1¼ inch main than the books of the company at this time. On 2 inch main, the books of the company show 1,229 feet more than my map. 3 inch main my inventory shows 306 more feet than the books of the company. 4 inch main the books show 589 feet more

than my map. 6 inch main my inventory shows 9,350 feet
554 more than the books of the company. 8 inch main the books of the company show 234 feet more than my inventory; 10 inch main, the inventory shows 710 feet more than the books of the company; 12 inch main the books show 337 feet feet more than the inventory; 16 inch main the books show 31 more feet than the inventory; 20 inch main, the inventory shows 72 feet more than the books of the company.

The dates on Exhibit 20 have nothing to do with the age of the map. It was supposedly complete to January 1, 1913. There was some confusion on Exhibit 19 about the symbols relating to the sizes of the mains. That was straightened up in our new map, Exhibit 9. When I started this investigation of the mains, in a general way I looked through the drawings of the company. In this work, the work orders were brought in by the foreman or superintendent of the distribution, to settle matters in dispute, and to that extent they were used in the tabulation of my main map, Exhibit 9. The number of services that I have assigned in my inventory was taken from the managers report sent in to the home office. That is shown in the same report that the company's report of mains appears. I considered that it was the best source of information available for services. To get at the average length of the services, we took the length of a certain number each year over the entire period, found out the total in feet and divided that by the total number, which gave us the average length of 73 feet for the services. We secured this information from the records of the company and it is based on the 1¼ inch services. The services that we selected each year we considered were of the fair and average length and the length that we selected was the total length from the main to the meter.

The excavation for the purifying house as shown in Exhibit H of Mr. Lea's report, was arrived at by taking the depth, eight feet, and other dimensions of the building, and giving a clearance of one foot around the width of the footing and giving the bank a
555 slope of thirty degrees. The item of back filling and removing surplus matter is my estimate of what it would be necessary to do in that line. In arriving at the quantity of brick in the purifying house, I measured the walls and estimated their thickness, and I think Mr. Lea in his report, used the same number of brick that I furnished him for this building. I figured out the number of brick based upon their size and superficial feet of wall area. All of the mortar used in this building is Portland cement. The thickness of the concrete floor, eight inches, was given to me by Mr. John Irvine, who had cut through and knew what it was. I determined the weight of the steel in the roof trusses by measuring and figuring each member separate, and the wood framing was determined in the same way. From the generator house I figured the foundation as three feet six inches and the same depth for the excavations. The steel in the roof of the generator house was arrived at by measuring each member separately

and estimating the weight per foot and all of the woodwork there was measured by me. I secured the information as to the depth of the foundation of the generator house and retort house from the works foreman, who was the oldest man on the ground and knew more about the construction of these buildings than anybody else. I did not make any excavations to determine the depth. The depth of the foundation for the seven foot six inch water gas sets was determined in the same way, as was all of the other machinery foundations at the gas works, with the exception of the 500,000 foot holder. The information as to that was secured from a drawing from which the holder was built. The length and width of the foundation for this machinery was actually measured. The steel in the foundations for the purifying boxes was actually measured, and I took Kent's average weight for cast iron columns of a certain diameter and applied it to those. In figuring the brick for the purifying house, the retort house, the coal shed and the booster house, in the storage plant, I found they used a brick
2½ x 4 x 8½ and I figured 16 brick to the cubic foot for a
556 thirteen inch wall. For a nine inch wall I used 10 7/10 brick;
for a 17 inch wall 21 3/10; for a 21 inch wall 27. In the generator house, meter shop and oil tank they used a brick 2¼ x 4 x 8 and for a 9 inch wall there are 12 3/10 brick per cubic foot; for a 13 inch wall 18 5/10 brick, for a 17 inch wall 24 6/10 and for a 21 inch wall 30 8/10. The concrete used there is first class concrete and was not broken, that I recall.

In my inventory of mains I reported to Mr. Lea the number of feet of each sized main, whether or not it was under paved street and if so under what kind of paving. I know that the mains are under this paving because I secured a map of the paving from the city engineer's office and compared my tabulation of the location of the mains with that map. I assumed that all of the mains were between the curb lines of the street. I secured the width of the pavement on the various streets. The mains are located anywhere from nine to twelve feet from the curb line. Mr. Lea used my figures for concrete and excavation for the 500,000 foot holder. On the 200,000 foot holder I determined the quantity of material and labor from my experience with the light type of holders constructed during my experience. I did not determine the actual dimensions of the masonry tank. I recorded 10,000 square feet of plastering for that holder tank, to Mr. Lea, and determined that quantity by figuring the inside surface. I was unable to determine whether it was actually there or not as I am not a diver, but it would be foolish to build the tank without it. I arrived at the figure for the cement plaster on the interior of the tank of the 50,000 foot holder in the same way, and in reporting the excavation for the 50,000 foot holder I noticed and took into consideration the relative elevation of the tank and its surroundings. I reported the number of drips in the gas mains. I secured the information from the company's records.

557 Redirect examination by Mr. Strode:

It is the ordinary practice to plaster the tanks of the holders. If they are not plastered at the beginning they will have to be plastered later. I believe if we were to take into account the additions in mains shown in the annual report of each year, starting with 1901, that it will come out about the same as my map. There are three or four independent sources by which my map can be checked with the records of the company. One is the map of 1901, another is the annual report each year since 1901, then there are the accounts of the company and then there are the work orders, and there is not a single one of these records that check out the same results. My statement that my map showed 9,000 more feet of 6 inch main than the records of the company, was based upon a misapprehension and was on the assumption that the annual report of 1912 contained the additions of main made each year.

558 EDWARD W. STEINMUELLER, being first duly sworn testified on behalf of the plaintiff as follows: Pages 2807 to 2917 original record.

Direct examination by Mr. Strode:

My home is in New York. I am now manager of the eastern territory of the Western Gas Construction Company of Fort Wayne. They manufacture and install everything for a gas plant, including the items of equipment listed in Mr. Lea's report, but nothing in connection with the distribution system except the gas or storage holder. I have been in this business 25 years. I was 18 years with Bartlett, Hayward & Company, who are manufacturers of the larger equipment of gas plants, such as holders and appliances for the manufacture of coal gas. They are located in Baltimore, Maryland. I was with them until July, 1906. I started out with them as assistant to the general manager in charge of the engineering end and the office end, later took care of estimating and part of sales. Then I went with Kruse-Kemper of Philadelphia. They are manufacturers of plate metal work, connected with gas works, such as holders, purifiers, oil tanks and works of that character. They do not have any foundry or machine shop but simply do the plate metal work. I was manager of their plant, and while there I did the designing of the equipment which they manufactured. Their principal business is holder manufacturing. They were competitors in a small way of Bartlett, Hayward & Company, but the last named concern did not attempt to make any of the smaller works and the output of the Kruse-Kemper Company was limited to light equipment. I was with them until January, 1908, when I went with the Kerr-Murry Manufacturing Company of Fort Wayne Indiana. I was assistant to the general manager and there had charge of the engineering department and did the designing of the gas holder and equipment. Their business was to design and
559 install coal gas equipment, gas holders, containers apparatus, purification apparatus, iron work for valves, etc. They have

been in the business probably fifty years or more. Their business extends throughout the country and in Canada and in Mexico. I continued with them until July, 1909, when I went with the Chicago Bridge & Iron Works of Washington Heights, Chicago. They are manufacturers of water tanks, railroad bridges, structural works and plain metal works of that description. After I went there they decided it was advisable to enter into the manufacture of gas holders and I furnished them designs and details of every description, and secured contracts for and equipped and installed about eleven holders during my stay with them. I continued with them until January, 1911, when I went to my present concern.

The Western Gas Construction Company supplies practically the North American continent and part of Brazil. They come in competition with the United States Gas Improvement Company, the Gas Manufacturers Company of Cleveland, with Bartlett, Hayward & Co., Riter Conley Company, R. D. Wood & Co. and Stacy Manufacturing Company, and many others. They have furnished equipment for the Lincoln Gas & Electric Light Company and I personally contracted for the last 7 foot 6 inch water gas set. On such equipment as we furnish ourselves, I could give very accurately the prevailing prices from 1907 down to the present time, but on equipment which we do not furnish, I would have to make an examination and get the capacity and size. There is a standard price for such a piece of equipment as a condens*or* and you can tell the price by knowing the size of the condens*or*. Its cost is also effected by such things as freight, and rates and traveling expenses of erectors. The 7 foot 6 inch water gas set being the first item of Mr. Lea's report under works inventory, was sold to the company by me. There was included in the sale at that time a generator, a carbureter, superheater, wash box, and part of the operating floor, the oil equipment and piping.

560 We did not include the building of the foundation. It is only in very isolated cases that we include the foundation for the reason that the gas company can provide that much cheaper than we can. We do design the foundation, however, if we are familiar with the land on which the apparatus is to be located. The cost of furnishing and erecting on their foundation the apparatus I have just mentioned, would be about $8,400.00. That is what the company would have to pay for it if they went out to buy it. I know of no place where the same could be purchased for $7,500.00.

The seven foot six inch water gas sets are a standard make of water gas sets and are called the Lowe process. The two seven foot six inch water gas sets mentioned in Mr. Lea's report would cost about $8,300.00 because there are some improvements on the second set. It would cost that much to purchase it on the market. This covers the generator, superheater, carburet*or* wash box and equipment for the oil and steam, but does not include the foundation and the floor. It does include all steam and oil connection brought within five feet of the machine. We furnished the floor in connection with the last water gas set. The price is usually summarized in a square foot figure, which includes the supporting I beam, the floor plates and

hand railing and stairway and is usually figured at $1.25 per square foot. $1,600.00 would be the reasonable cost on a floor 32 x 40 furnished with those water gas sets at $1.25 a square foot. That figure of $1.25 is over the whole area of the floor without deducting for the openings. No such price could be secured if the floor was treated as a separate item, but it must be treated in connection with the water gas set.

My prices of $8,400.00 and $8,300.00 on the two water gas sets include the price of $1,600.00 on this floor. A very small section of railing was furnished with it. In connection with a water gas set, it is necessary to have a condensor and scrubber, but one condensor and one scrubber can be used with two water gas sets.

561 The cost of the condensor depends upon *upon* the number of tubes. We furnished W. G. Condensors 16 x 20 and water gas scrubber six feet six inches by 21 feet shown in Mr. Lea's report, and the fair market price for those two apparatuses at any time since 1907 is $1,675.00 erected on the company's foundation. This does not include any part of the foundation nor any of the connections except the nozzles, which are a part of the shells.

The six foot six inch water gas set which is the old set referred to in Mr. Lea's report and consisting of the generator six foot six inch by thirteen feet, superheater, six feet by eighteen feet, carburetor six feet by twenty-four feet, wash box, five feet by two feet six inches, condensor, five feet six inches by twenty feet and scrubber five feet six inches by twenty feet, since 1907 to this time has had the reasonable price of $8,100.00 to $8,200.00 erected on the company's foundation, but without the foundation, and this equipment could not have been purchased for less money since 1907.

The number seven Sturtevant blower belted, without its driving apparatus and referred to in Mr. Lea's report, would cost anywhere from $210.00 to $235.00 at any time since 1906. This would be erected on the company's foundation. The company would have to pay in addition for the foundation, and the driving mechanism. The F. O. B. factory price of the No. 8 Sturtevant Turbo blower, type G-3 steam pressure 100 pounds, is $1,025.00 and in addition to that they would have to pay the cost of the foundation, freight and bringing the steam and air connections to the machine. About $65.00 or $75.00 should be added to this for freight, erection and Lincoln connections. The fair market price since 1906 of six benches three-fourths depth, exclusive of the cost of foundation, would cost on an average from $2,500.00 to $2,700.00 per bench up to the outlet of the main and erected on the gas company's foundation. That is a fair cost.

If the multi-tubular condensor four feet six inches by twenty-five feet contains 81 three inch tubes, the price is between $675.00

562 and $700.00 on the gas company's foundation excluding the cost of the foundation. This price is exclusive of the transportation of the men and tools to and from the place of erection. The scrubber five feet six inches by thirty one feet at any time since 1906 would cost about $425.00 located on the gas company's foundation. This price is exclusive of the foundation. I am acquainted with

the selling price of purifying boxes throughout the country. At any time since 1906 the four purifying boxes 20 x 24 x 4 referred to in Mr. Lea's report on the usual cast iron columns in a straight line, exclusive of the building and foundation tiers, on which the columns rest and exclusive of the main connection and main outlet, but including the connections between the center seal and out of the four boxes and including the hydraulic cover hoist, would cost between $14,500.00 and $15,000.00 and that would be the price that the company would have to pay for that equipment exclusive of the foundation at any time since 1906.

The ten foot McDonald station meter, with a Hinman drum, exclusive of the cost of the foundation, would cost between $3,900.00 and $4,000.00 erected on the company's foundation, which includes adjustment, etc., of the meter, and that would be a fair cost for that equipment, if it was purchased at any time since 1906. The last item, a six foot station meter, Parkison drum, would cost at any time since 1906 $1,250.00 erected on the company's foundation, but that does not include the cost of the foundation. Our company constructed the 500,000 foot gas holder. The fair cost of that gas holder at any time since 1906 exclusive of the foundation and including the in and outlet connections, up to the drip pots, the gas company furnishing us the steam for the erection and furnishing the water, is $40,000.00, which includes the permanent wooden frames inside and all of the scaffolding. That is a fair price, although the company did purchase it for a fraction less than that, because we had contracted to sell this holder to a southern city and some complications arose in the matter of payments and we cancelled the contract. We
563 held the material for eighteen months or two years, and kept it in shape during that time, and in order to realize on the money invested in it we decided to dispose of it at a sacrifice and as a result the Lincoln Company saved some thousands of dollars and got it cheaper. We received $37,500.00 for it.

Not figuring any piling, I would say that the foundation for this holder would cost anywhere from $4,800.00 to $5,000.00, figuring on a four foot frost line, and a foundation to be five feet deep for the outer wall, and for the inner pancake I am figuring on twelve inches re-inforced. The fair cost at any time since 1906 of the 200,000 foot holder, just the holder proper and the guide frame, is between $16,000.00 and $16,500.00 and in addition to that you would have to pay the cost of the brick tank with a concrete bottom and the excavation and the water. The tank forms the foundation itself. Our company does not build a brick tank with concrete foundation. We design them, depending on local conditions and the gas company furnishes the tank. The brick tanks are antiquated. Sometimes there are local conditions that would make it advisable to put in a brick or concrete tank, but the steel tank construction is the accepted construction of today.

The figure I have given you is about one-half of the total cost of the holder. This being a two lift gas holder, is about 60 or 65% of the total cost of the gas holder. On the 50,000 foot gas holder I can only give you again the cost of the holder and the guide frame.

That portion of that holder would cost in the neighborhood of $4,-200.00 and that is about 42 or 45% of the total cost of the holder. The fair cost of the 20 inch Conelly automatic governor is between $850.00 and $900.00 erected on the company's foundation. The fair cost of the 12 inch Reynolds station governor is about $450.00 erected on the company's foundation. The fair cost of the last item in Mr. Lea's report the two steel tar tanks 10 feet 6 inches by 29 feet 3 inches, thickness one-fourth inch, would cost about $1,300.00 to $1,350.00 erected, exclusive of the foundation.

564 The fair cost of the two steel oil tanks twenty feet two inches by twenty-nine feet three inches for 25,727 pounds of steel would cost about the same price. The last two items, two oil tanks, one 8 feet x 24 feet, 7,926 pounds of steel and the other 8 feet x 30 feet, 10,261 pounds of steel, would cost about $1,200.00 for the two tanks, exclusive of the foundation and without any connections. The fair cost of the gas holder and guide frame erected complete, with the in and outlet pipes and iron works for the tank, delivered, of the 100,000 foot district holder, single lift, is between $7,000.00 and $7,200.00. This does not include the cost of the brick tank. This represents about 40 to 45% of the total cost.

These figures which I have given represent the fair cost of the equipment if the company had to go out and buy it at any time during recent years, under ordinary conditions. That would be what is known as the net construction cost, with a number of the other items of cost added to that for overhead expenses. Where we furnish an entire plant, we add to the construction cost a percentage of some 15% to 20% for overhead expenses or overhead burden, and that is over and above the amount we are paid for equipment.

Cross-examination by Mr. Adams:

Through my connection with the business of the Western Gas and Construction Company, I have become well acquainted with the size and types of all the equipment which they sell. The eleven holders that I designed and built were with the Chicago Bridge & Iron works, and ranged in capacity from 10,000 to 300,000 cubic feet. Since I have been with the Western Gas & Construction Company, they have built 35 or 40 holders, ranging in capacity from 10,000 to 1,000,000 cubic feet. Outside of one, none with a capacity of over 200,000 cubic feet had a masonry tank. That one was the 1,000,000 capacity holder at Saint Louis. My recollection is that it was composed entirely of brick. None of the holders sold while I was with the

565 Chicago Bridge & Iron Company, of over 200,000 capacity, had masonry tanks; they were of steel tanks. We build all types of purifying boxes. The cast iron rectangular style; in fact every type except concrete.

The tendency at the present time is toward the construction of outdoor boxes, except in extreme northern climates where climatic conditions are adverse to having the box unprotected. There we do not advocate the steel boxes and the old style of cast iron box in a building is followed. Our company furnished some steel boxes

at Racine, Wisconsin, for the Racine Gas Co. They are protected against temperature conditions by the steel coil inside of the box, which is quite advisable in that territory. The smallest box shown in my list is 12 x 12 x 10 feet, and the largest is 24 x 32 x 10 feet. All of the boxes in my list have a standard depth of ten feet. These are the prevailing type of cast iron boxes, but as to the depth that varies with the space available and the equipment required. It depends upon how much floor space we have. The capacities of the boxes made by my concern are as follows: All are 10 feet deep, 12 x 12 432,000 cubic feet every 24 hours; 12 x 16, 576,000 cubic feet every 24 hours; 16 x 16 768,000 cubic feet every 24 hours; 16 x 20, 960,000 cubic feet every 24 hours; 20 x 29, 1,200,000 cubic feet every 24 hours; 20 x 24, 1,440,000 cubic feet every 24 hours; 24 x 24 1,730,000 cubic feet every 24 hours, 24 x 32 2,300,000 cubic feet every 24 hours.

The seven foot six inch water gas set sold to the local company by our company in 1912 was for a consideration of $8,000.00 and on this consideration we allowed them $400.00 for an engine which our company took back. This is indicated by Exhibit 320 although my recollection in the first instance was that the engine returned was to be in addition to the contract of the $8,000.00. The contract covered the generator, carburetor, superheater, wash box, or seal, the oil connection to the carburetor and including the pump and
also probably the oil heater, and one-half of the operating
566 floor required for this set. The equipment covered in the purchase of the seven foot six inch water gas set in 1908 shows a generator, carburetor, superheater, seal an operating floor 15 x 28 feet, which includes the stairway and railing, scrubber, condensor, oil supply system, consisting of pump meter, oil heater and the injectors and the small piping between these various pieces of apparatus, up to a point five feet from them, and the nozzle, with its accessories and the firing tools for the set, and naturally the lining for the apparatus. We delivered and erected this stuff on their foundation for $11,075.00.

The pipe for construction of the condensor and scrubber is set out in this list of specifications which I hand you and of which you are permitted to make a copy, and it also shows the number and size of tubes, metal, thickness, etc. This is the condensor and scrubber which I testified would cost $1,675.00 erected and which is included in this total price. The apparatus which has been turned out by the Western Gas Construction Company since about 1900 is better than it was at and prior to that time, and by that I mean it is more economical. The price of $8,100.00 or $8,200.00 that I gave you on the six foot six inch water gas set, includes the generator, carburetor, superheater, seal, scrubber, condensor, oil equipment, gauge bored, operating floor, small pipe around the apparatus, gas connections to the outlet of the consumer, all erected on the company's foundation in their building. This did not include any blowing apparatus.

I do not have the detailed specifications of the condensor and scrubber in this set. The scrubber which we would furnish for this

price with this set, would be six feet by 21 feet, with 131 three inch tubes, eighteen feet in length. The company actually paid for this set $7,976.15. The Sturtevant blower with the steel Turbo blower was sold to the local company by our company for $1,060.00 delivered at Fort Wayne. I said the fair cost price would be $1,025.00. I do not have a copy of the proposition on this which shows exactly
what we furnished, but at this time we furnished the No. 8
567 blowers with 52½ horse power, and a Turbo blower for a six
foot six inch set, which probably accounts for the apparently high price of that blower F. O. B. Fort Wayne.

Our company furnished the iron to the Missouri Fire Brick Co. for three of the benches of ½ depth sixes, in October 1900, and in April 1906 we furnished the Improvement Equipment Company the iron works for three benches ½ depth. I am not at liberty to disclose the price at which we furnished this iron, for these companies. I would be divulging some of their business. If our price had been direct to the Lincoln Gas Company, I would not hesitate to give you the figures. The iron work included in the construction of a bench of six retorts, is divided into three parts, the furnace iron works, which is usually furnished by the brick manufacturers themselves, the mounting and the bindings, which consist of I beams, and tie rods and anchoring. The weights of six mouth boxes complete, six sets of sand pipe, six bridge pipes, six drip pipes, steel hydraulic main and the supports, will run in the neighborhood of 9,500 pounds per bench, and this is the weight on this material which has been used substantially since 1900, and is the same on all of the benches furnished to the Lincoln company. This rating is for the metal on the bench mountings only, and does not cover floors, bindings, furnace castings, foul main, or tar displacement system.

I gave the cost of the three-fourths depth benches on my direct examination as from $2,500.00 to $2,700.00 and one-half depth benches would not be more than $100.00 less. I am unable to give you the items that make up this figure. We are frequently called upon to make prices for a complete plant, and on the benches we simply get the price quoted us by the bench people and apply the price that we think most favorable and sublet the bench work. I have obtained these figures within the last three months. This price includes everything, the brick work and iron work up to the offtake to the hydraulic main, but does not include the foundation. The bench trimmings or irons for benches like the six retort bench used
by the Lincoln company will cost from $550.00 to $600.00
568 delivered on cars Lincoln. These parts weigh about 9,500
pounds. The retail price of the repair parts making up the iron on a complete bench would probably exceed the price of $550.00 to $600.00 delivered on cars Lincoln.

These prices of $675.00 to $700.00 which I gave on my direct examination on a four foot six inch by twenty-five foot condensor contemplates 81 three inch tubes 22 feet in length and represents a good condensor erected on the company's foundation. The price of $425.00 which I gave for the five foot six inch by 31 foot scrubber, contemplates the regular steel top with three ankle iron rings on the

inside, spaced about equally so as to divide the condensor into four compartments. These ankle rings would serve as supports for wooden trays, which in turn would support the agent provided by the gas company for scrubbing purposes. The price includes the layers for these trays. I do not know whether that construction is the same in the scrubber used here in Lincoln.

The price which I quoted on the purifying boxes erected in position is for the reproduction of just the same boxes as now exist here in the Lincoln gas works. The purifying boxes in my list nearest in capacity to these boxes is 12 x 16 x 10 and four of these with such equipment as is found in the present plant would cost about $12,000.00 with the wet lute. The cubic capacity of the boxes located down at the plant is 1,920 cubic feet. I would recommend these in place of the 4 boxes 24 x 20 x 4 foot boxes now found in the plant of the company. These four boxes have about the same purifying capacity, which is dependent upon the cubic feet of Oxide which is contained in the boxes to treat the gas, and these four boxes could be used with about the same economy or capacity as the space now found within the present boxes. The four 12 x 16 x 10 foot boxes would have something over 600,000 feet, while the four 20 x 24 x 4 boxes would have 700,000 feet capacity. The cubic interior contents of the two sizes of boxes is identical, but the purifying capacity of the boxes now here is a little greater than that of the 12 x 16 x 10 foot boxes.

569 One cubic foot of Oxide will purify from 150 to 160 cubic feet of gas during a period of 24 hours, and in the purifying boxes now found in the plant I am figuring on an Oxide layer of 20 x 24 x 3. The cost of the six foot meter there, if it had a Hinman drum instead of a Parkison, is from $1,400.00 to $1,450.00 and the cost of a ten foot meter with a Parkison drum would run from $2,500.00 to $2,800.00. The latter would have a capacity of 63,000 cubic feet per hour. The 500,000 foot holder here was first sold to Augusta, Georgia. I have known them to sell for less under certain conditions, during the last five years. The iron and steel work on a 500,000 foot holder will run from $75.00 to $80.00 per thousand depending entirely upon the details of the construction and the design. $75.00 on that size holder is extraordinarily low, on designs as they now run.

I estimated the valuation for this holder to cost $48,500.00 figuring on 400 yards of concrete at $8.00 per yard and 30,000 pounds of reinforcements at two cents a pound, with the outer wall or foundation extending five feet into the ground. If the outer wall goes in only three feet, it will make a difference of 31 or 32 less cubic yards of concrete and $248.00 less in the cost. When I figured upon the thickness of one foot in the pan of this foundation, I assumed that the ground underneath would be capable of withstanding a weight of 1½ tons per square foot. This requires absolute absence of running water of any kind. Good sand or clay to the depth of six or eight feet would be an excellent soil, the underlying soil to be ordinary rock or broken stone, or anything but water and quicksand. In this foundation I am figuring on the absence in the excavation of water

and quicksand. Under those conditions you ought to have a thickness of one foot for the pan. In addition to the concrete, I took into consideration the expense of excavating and backfilling and a layer of dry cement on top of the concrete. For the excavation and back filling, I figured $1.00 per cubic yard, which is the entire cost of handling the soil.

570 The weight of the steel and iron parts in this 500,000 foot holder is 710,000 pounds. In this is included the twenty inch inlet and outlet pipes, erected and in place, which I figured at $700.00, with the drip pots, which is about 120 feet of pipe of a weight including the drip pot of 20,000 pounds, figured on the gas institute weights. On the 200,000 foot holder I figured a total weight of iron and steel of 276,000 pounds which includes the inlet and outlet pipes. These weigh about 29,000 pounds, which leaves the weight 247,000 pounds exclusive of the inlet and outlet pipes. The counterbalance weights and the apparatus with it, aggregates 19,170 pounds, leaving for the steel and iron works 227,830 pounds.

When I said that the cost of this holder represents from 60 to 65% of the entire cost of such a holder, with a masonry tank, I made that statement entirely dependent upon the character of the masonry work, and had in mind the construction under ordinary soil conditions required no blasting and no water and no shoring up of the embankment, and figured on a tank laid in cement mortar. Of the 50,000 foot holder, the steel and iron, I estimated, would weigh 66,500 pounds of which 9,600 pounds would be represented by the inlet and outlet pipe, which would leave the weight of steel and iron 56,900 pounds. A steel tank holder of 200,000 feet capacity is somewhat cheaper than a masonry tank holder. A steel tank holder of that capacity would cost approximately $25,000.00 including the foundation.

The type of construction is turning to the steel tank type, because it is somewhat cheaper and in addition they have absolute control over the physical conditions of the tank at all times. If leaks develop they are easily taken care of in a steel tank. It is directly opposite in the case of a masonry tank. A twenty inch Conelly governor F. O. B. Lincoln, unerected, would cost close to $800.00. The twelve inch Reynolds station governor F. O. B. Lincoln would cost probably $415.00 to $420.00. The tar and oil tanks would cost F. O. B. cars at Lincoln, unerected, about $1,200.00 to $1,240.00 per

571 pair, based upon a weight of 25,000 pounds for the pair, with a thickness of five-sixteenths inch and one-fourth inch shells.

If the tanks were substantially less in weight, it would not make any difference in the cost on the cars here, as the labor entering into the fabrication of these tanks is about constant for light or heavy tanks.

I do not know who furnished these tanks. Our company furnished the 100,000 foot holder, which included the gas holder and the guide frame erected, and the twelve inch inlet and outlet connections and the necessary iron work for the tank delivered on the ground. There were 18,000 pounds in the inlet and outlet pipe and 102,000 pounds in the tank iron guide frame and holder, of which

4,000 pounds was for the tank iron. The Western Gas & Construction Company was paid $7,000.00 for what they furnished on this holder, which covered the erection of the guide frame and holder. The inlet and outlet pipe- were figured at $607.00 and the tank iron $240.00. Under certain conditions steel tank holders of 150,000 to 250,000 capacity are sometimes sold for less than $100.00 per thousand foot capacity.

In selling gas equipment for a whole plant, we ordinarily make better prices on it than we would for the separate parts, and the price which I have given was made on the basis of purchasing each part separately. This is due to the fact that many of the arrangements which make up the price, such as traveling expenses of our erectors, and the keeping of accounts and contracting expenses, is constant on both the large and small contracts, and when the number of contracts is reduced and all included in one contract, this necessarily reduces the price on each individual piece of equipment. There is ordinarily included in the contract for the erection of the large pieces of gas equipment a clause placing upon the contractor the liability on account of injury or damages received by any party by reason of the contractor's negligence during the construction and until the completion of the work.

572 Cross-examination conducted by Mr. Morning:

H. L. Doherty & Co. is not interested in any way in the Western Gas Construction Co. Our company has in times past furnished and sold to other companies than the Lincoln Co. operated and controlled through Doherty & Co. various pieces of gas equipment. I do not think it comes through Doherty & Co. but through the management of the individual plants. Doherty & Co. do*es* not get a discount or compensation from our company on account of the contracts or supplies and equipment which we have with their control companies. The price at which we furnish the iron work in the benches which were built by another company was slightly less than the value I have placed on that item of construction. The difference was the discount allowed to the manufacturer of the benches. We have furnished iron work to the Improvement Equipment Co. which Improvement Co. is one of the subsidiary companies. The Improvement Co. is, as I understand it, one of the Doherty interests.

"On examining Exhibit 320 and refreshing my memory, I think that the $8,000 contract price included an old engine we took from them and the amount we realized for the engine was $400, and this was to be and was credited by us on the $8,000."

Redirect examination by Mr. Strode:

In view of the fact that the Lincoln Company, for instance is operated and controlled by the Doherty people, who have a large number of companies in the same situation, would tend to reduce slightly our prices to any one of these companies on equipment which we furnish them. The prices I have given here for condensors and scrubbers I have figured as the furnishing of single equipment, without

any other contract and it is the same on each of the items I have covered. With reference to the three water gas sets the six foot six inch and the two 7 foot 6 inch sets, the aggregate price, including the condensor and scrubber and the operating floor, would amount to in the neighborhood of $26,500.00 exclusive of the foundation. In the case of a purifying box, if the box is not so deep, and is spread out more, the gas will come in quicker contact with the purifying materials in the box and the deeper the box the greater pressure you have to use to increase your velocity and when you increase
573 the velocity there is an interference, to a certain extent, with the purification of the gas. I think it is more desirable to have a box four feet deep than to have one ten feet deep. My figures on the 500,000 foot holder, the 200,000 foot holder, the 50,000 foot holder, the Conelly automatic governor, the Reynolds station meter, are all equal to or a little higher than Mr. Lea's figures on the same items. In figuring the pan of the foundation for the 500,000 foot holder, I figured on a depth of one foot and an extension of three feet beyond the holder. If the depth, instead of one foot, is one foot nine inches and one foot six inches, at different places, and the pan extends six feet nine inches beyond the holder, that would increase my estimated cost.

Recross-examination by Mr. Adams:

With reference to the weights I have given on the 200,000 foot and the 50,000 foot holders, these were secured by estimating from the gas company the pressure that the holder threw. I was in the works and looked over the guide frame and made an estimate covering approximately the weight as it now stands. Of course the iron work for the tank and in and out pipes I had to assume as standard. The diameter of the pipe I ascertained from the plan. The guide frame consists of nine columns, latticed type. The cross sections of the columns are eighteen inches wide and twenty-six inches deep radially. They are constructed of 2½ x 2½ quarter inch angles at the corners, with 2 x 5/16 flat bars for lattice work. Every column is provided with a railroad bar as a guide and there are two rows of horizontal girders, each approximately 24 inches deep, of I shaped. The diagonals are round bars provided with eight turned buckles: the bosses are heavy cast iron base plates and are included in my figure for the holder and guide frames. The foundation parts are both of iron work for the tank. I had the cross sections of the material entering into this construction measured. I took the weight per lineal foot on shapes and per square foot on plates, which
574 were based upon actual measurements. The nearest standard size of box in cubic capacity, to the boxes at the plant, are two boxes 25 feet diameter by eleven feet six inches high. These would have a cubic foot capacity of 9270 as compared with 7680 cubic feet of boxes now there. These boxes would have a capacity of 1,100,000 cubic feet of gas per twenty-four hours and the boxes there would have a capacity of 700,000 cubic feet. These would cost erected on the company's foundation, $5,500.00 for the two boxes. They are dry lute purifiers of the type commonly put out of doors. The pre-

vailing type of box being sold to any gas works, is the cylindrical steel box outside and for the inside boxes cast iron. We adhere as closely as possible to the duplex type which calls for from nine to ten feet in depth.

Redirect examination by Mr. Strode:

The price of $5,500.00 mentioned for the two boxes above does not include what is in the boxes in the plant at present, nor does it represent what it would take to replace those boxes. The steel used for the reinforcement of the foundation for the 500,000 foot holder is not fabricated, but is purchased direct from the mills.

Recross-examination by Mr. Adams:

In figuring on the two boxes for $5,500.00 I figured on whatever connections were necessary between them and included that.

Redirect examination by Mr. Strode:

There is an advantage in having four boxes over two, which depends upon the variation in the make of your gas. It is always preferable to have one of your boxes out of commission and if you can divide it up into smaller units you would naturally put out of commission a smaller unit and when anything happens you have a chance to shift in order to make repairing.

575 Recross-examination by Mr. Adams:

The tendency of today in outdoor boxes is to put in two, of course depending upon the size of your plant and the fluctuations of the gas.

Recross-examination by Mr. Foster:

In 1912 our business with the Lincoln Gas & Electric Co. was $8,000.00; in 1910 it was $8,066.00; in 1908 it was $48,575.00; in 1901 and 1902 it was $7,976.15. I can not tell you whether or not there was any business done in the other years, for I do not have the records here.

Recross-examination by Mr. Morning:

We have sold equipment to companies operated by Doherty & Company at the same price that we sell to other individual companies not controlled by them.

576 GEORGE L. CAMPEN, being first duly sworn, testified on behalf of the plaintiff as follows, pages 1292 to 1392 original record:

Direct examination by Mr. Strode:

I have been assistant city engineer, city engineer, sewer engineer, sewer inspector, plumbing inspector, and superintendent of public works of the City of Lincoln during the period from 1891 until 1906.

I was also superintendent and water commissioner for the Canal Zone in Panama, and superintendent of public works. I was assistant city engineer of Omaha for three years. As engineer in Lincoln I was in charge of the construction of paving. The greater portion of the paving in the business portion of the city was done while I was city engineer. The work of constructing sewers was under my direct supervision. The city would do the work instead of letting the contracts.

The gas plant was formerly located about 6th and N streets. I was here at the time it was moved to its present location in about 1893. I was by there frequently during the period of construction. It is my recollection that there was no piling used in the foundation of any of these buildings. I know there was none used in the construction of the stack, and the use of other materials about doubles the cost of the foundation. I am not clear as to whether or not piling was used in the foundation for the purifying house. As city engineer I had charge of the construction of sidewalks and the matter of opening streets and laying out gas mains came under my supervision. If there was to be a gas main extension the company had to get a permit from me. If they desired to open a paved street they had to put up a bond to cover the cost of any opening. In all cases where a paved street was opened for any purpose the matter of repairing the opening and keeping it up was controlled by the contract by the man who built the pavement. He would replace it and maintain it under the charges fixed in his contract. Whenever a paving
577 contract was let it provided that the contractor should maintain it for ten years and any repairs and replacements on account of openings were made by him. Any payment to him for this was usually made according to the stipulated price in the contract and neither the gas company nor the city was permitted to make its own repairs on its own account.

The ordinances required that the mains be located one-third of the width of the street from the south and west lines. The gas mains were required to be on one side and the water mains on the other and they were required to be in the street. Streets of 120 feet in width with a 30 foot roadway had gas and water mains lying under the parking of the street but where the roadway is 40 feet in a 100 foot street both the water and gas mains by ordinance were required to be put under the pavement. The gas mains were placed in O street immediately previous to the paving as the paving proceeded. The city required the trench for the main from 16th to 27th streets to be filled with broken stone. That cost five or six times as much to fill than with ordinary dirt.

I have been furnished with a statement of the number of feet of different sizes of mains under the pavement in this city and have made a tabulation and compiled the cost of reproducing that service. I made physical inventory for the reproduction cost for the gas plant in Omaha. I finished that within the last eleven months. The services are not included in my tabulation of the mains in the city nor are the drips and valves. My tabulation is exhibit 67 which shows the size, kind, and length in feet of the different mains under

the different kinds of pavement and gives the cost of all of the different sizes and the cost of taking up and replacing the paving under the different sizes. This is as of January 1, 1913 and is the reproduction cost of that date. Prices were taken as of that time.

In considering the 2-inch pipe I have used, as a basis, 315,708
578 ft. In Mr. Lee's report the same item is 359,601 ft. The figures given for removing and replacing the paving over mains under paved streets represent what it would cost the company to have the paving contractor do the work, and does not include any over-head charge carried by the company in the general supervision of the entire property. The total cost of the mains referred to in exhibit 67 is $284,701.27. After eliminating the error in the tabulation of 2-inch mains furnished Mr. Lee my figures are 3% lower than his on the total net construction cost of these mains. They are my figures based upon my judgment, assuming the amounts and feet to be correct.

Exhibit 67 is offered and received in evidence.

Cross-examination by Mr. Adams:

At the time the plant was moved to its present location I was down in that part of the country a good deal. The buildings of the old place, I think, were brick. It is my recollection that there was piling driven under the stack. I think it was for the boiler plant. The ground there is very poor and piles have to be put in very thick. There is about a foot of quicksand in there. G and C streets are streets in which the gas and water mains are laid outside the curb line as on those streets the curb is more than one-third of the distance from the edge of the street. The mains from 10th to 18th streets on C street are outside of the curb and under no pavement except where they cross intersections. The same is true of D street from 8th to 20th. In computing the cost of reproducing these mains I have assumed that they were to be reproduced by laying them in the parkway where they now are and not under the pavement, and for such lengths as now lay under the pavement. I have added what I estimated to be the cost of putting them there at this time. In figuring the reproduction cost of the mains in which the trenches were filled with broken stone on O street from 16th to 27th I have not figured on reproducing them in that way. My figures I have used
579 are an average of $1.90 per square yard for replacing asphalt on concrete and the concrete under it. For replacing the two-course brick I have figured 60¢ a square yard. I have figured the concrete under cedar blocks at 25¢, or $6.40 a cubic yard, on an 18-inch ditch with 26 inches of concrete to remove. I figured .4 of a cubic yard for it, which would make per lineal feet 25.6 to replace it.

I think on an 18 in. ditch you should have 26 inches wide of concrete, when I dig a ditch I dig the concrete down 4 inches wider than the ditch, so it is 26 inches wide on an 18 inch ditch, or .24 of a square yard per lineal foot of ditch. I figure 25.6 cents on an 18 inch trench under concrete or 6 cents per lineal foot taking it up and 5% for bonds and contingencies, and insurance — my men, mak-

ing a total of 33.2 cents for taking up and replacing everything. For removing concrete per lineal feet 6 cents, the asphalt on concrete removing 12 cents per lineal foot. Brick on concrete removing 12 cents. For removing the asphalt on concrete paving I have figured on 23¢ per lineal foot. On the two-course brick I have figured 7½¢ per lineal foot. I have to make the ditch wider there. In figuring on the cast iron pipe, on the 3 and 4-inch pipe I figured $30 per ton and on the balance of the cast iron I figured $28 per ton, F. O. B. the cars here in Lincoln. The weights used here were, on a 3-inch pipe, 139 lb. per foot; 4-inch pipe, 20 lb. per foot; 6-inch pipe, 30.8 lb. per foot; 8-inch pipe, 42.9 lb. per foot; 10-inch pipe, 57.1 lb. per foot; 12-inch pipe, 72.5 lb. per foot; 16-inch, 108.3 lb. per foot; 20-inch pipe, 150 lb. per foot.

I secured these from the United States Cast Iron Foundry Co. The standard shown by their latest catalog are these. I think they are about on an average with the weights of pipe of the gas company used in the streets of Lincoln. I think some of the pipes laid are heavier because I saw some of them laid and I noticed the weights marked on the ends of the pipe and things of that kind. I know that in a number of particular cases they had good heavy pipe. I also used an old catalog of the South Pittsburg Co. of about 1901. A great deal of the pipe was laid previous to 1900. Much of it has been relaid. I do not know when the 20-inch pipe was laid. If 16-inch pipe was laid on M street between 8th and 16th I know it was between 1900 and 1905. I don't think this is the heaviest pipe I ever heard of. I understood it was what was the standard at this time. They furnished me with the length and the sizes of their mains and I made a fair valuation figuring on what I would replace them for as a contractor. For the 1¼ wrought iron pipe I have figured on 5.96¢ per foot. On the 2-inch, 9.58¢. I have dealt with no other sizes
580 of this kind of pipe. I took these prices from the price list. I have just paid them to Crane & Co. of Omaha on another job, and after computing the difference in freight rates, a job of about four miles in length, 1½, 2 and 3-inch-s. The total number of feet in Lincoln are 2,258 feet of 1¼ inch and 315,708 of 2-inch.

I also took the price paid by the United States government in New York City. The price given in the Engineering News would be fairly right for long-time shipments. On steel, at $1.60 net prices if you want a 30 to 60 day delivery they will charge you possibly 25 to 50¢ a hundred more. I figured on 2 years' time to install this pipe system. In my estimate I have figured a cost of 4½¢ per foot, 10 months, and 9¢ per foot, 2 months, for digging an 18-inch trench for 1¼ wrought iron pipe, making an average of 5.25¢ per lineal foot. The average cost of back filling I figured at 2.33¢ per foot. The same is true of the 2 and 3-inch pipe. For the 4-inch pipe I have figured 5.633¢ for digging, and 3¢ for back filling and tamping. The digging for the 6 and 8-inch pipe I figured at 7¢, and the back filling at 4 2/3¢. For the 10-inch pipe I have figured 7.6¢ for digging and 4 2/3¢ for back filling and hauling away some of the dirt. On 10-inch pipe you have to allow for hauling away about .6¢ per foot which is in addition to the digging and tamping price.

For the 12-inch pipe the digging is 8.4¢ per foot, back filling, 4 2/3¢, disposal of extra dirt, .9¢. For the 16-inch pipe the digging is 9 1/3¢, the back filling, 4.9¢ and 1½¢ for removing the dirt. For the 20-inch pipe the digging is 11.86¢, and back filling, 5.945¢, and the hauling away, 2.4¢.

These prices are not based upon any unit price per cubic yard. They are based upon the prices used here in the city for a good many years. They are the average prices the entire year round. The frost goes down three or four feet here and you have to figure on
double cost for two months. At these prices you can get ex-
581 cavated 137½ cubic feet for $1. This would be a ditch 12 ft.
long, 5½ ft. deep, and 2 ft. wide. That amounts to .00727 per cubic foot. In my estimate I have used the trench 3½ ft. deep to cover it. When the pipe becomes 6-inch I have added to it the depth of the pipe.

In digging a trench down to 7½ or 8 ft. the depth does not make very much difference per cubic yard. A 5½ foot ditch would cost more than a 3½ foot ditch. The total material cost on 1¼-inch pipe is 6.51¢ per foot. That includes pipe, digging, tamping, fit-ing the pipe, cementing, and storehouse charges. My present line of business is engineering and contracting. I have bid on water pipe mains and have been awarded contracts but on account of litigation by the city over the assessment I refused to perform them as I was not sure of my money.

In the previous prices which I gave you I gave a price for concrete alone where the paving was wooden blocks on concrete as the wooden blocks had rotted away. The other prices on paving include the price of the concrete on which the paving rests. I have followed the same method on all of the different sizes of pipe, substantially. I have figured on lead joints through this job. Up to the time I left in 1906, while I was city engineer, they were all lead joints. Prior to that time those that I saw I know were lead. In taking lead joints I have gone on the assumption that wherever there is a cement joint the cost will be more in repairs. I figured the price of lead at 6½c. That was the market price in large lots, F. O. B. Lincoln, in December. The cost of lead joints is about four times that of cement. It is a very poor practice to put in cement joints. In Omaha they use cement joints except on high pressure mains. I know of no practice of making lead joints except by melting.

I have added the cost of coal in melting and 4¢ for storehouse charges. Taking 100 ft. of 16-inch pipe I figure it will cose $151.62, and I figure 4 or $6 would be fairly included as a storehouse
charge. Here pipe is commonly piled out-of-doors. The
582 storage includes unloading the pipe from the car, loading it
into the wagons and checking it in and out. My average price for digging the trenches is proportioned $1 per section for 24-inch and I assume that one-sixth of the pipe would be laid in the winter time. They lay more sewer and water pipe here in the winter time on account of labor conditions, although it costs twice as much. The kind of labor used in digging trenches is only plentiful in the winter time. After getting the cost of the other items in the schedule I add

20% to that total footing, 5% to cover incidentals like putting out lights, watchmen, and things of that kind, and 15% profit, which would include the insurance on my men and the price of my bond. Exhibit 68 is offered and received in evidence, being schedules of the witness' estimate for the detailed cost of laying his main.

After taking out the cost of the pipe and specials, 100 ft. of 6-inch pipe costs $36.755. This leaves 36.7c per foot. $80.75 covers every item of cost for putting 100 ft. of 6-inch pipe into the system. $43.99 covers the bare cost of iron and specials, F. O. B. the cars. The 20% figured for profit is figured on both material and labor and when you deduct the bare cost of the material from the total you have an exaggerated cost of the labor alone as the percentage of profit on the material is included in it, and the $36.75 per 100 ft. of 6-inch main, while it is the difference between the total cost and the bare cost of the material, is a little more than the cost of putting the pipe in. It could be done for a little less. I would say that my footing, .8075¢ per foot on cast iron pipe is a fair price for a contract to take the job. There is no comparison between the country and city jobs. In the country they do not require tamping and picking as they do in the city.

In figuring the allowance for specials I used one special for each 800 lb. of pipe figuring 3½¢ a lb. or $70 a ton, which was
583 a fair price on January 1st of this year.

Redirect examination by Mr. Strode:

In figuring the item of replacing the paving here in Lincoln in this estimate I took the price they specified in the specifications to the contract between the city and the contractor. I had the data assembled from the city engineer's office showing it so I could tell definitely the cost on each street. In figuring on the small amount of wooden block paving here I simply figured on the cost of replacing the concrete as the wooden block pavement is worn out. Contracts for furnishing pipe for sewer and water for the city were let on bids. R. D. Wood & Co. never submitted any bids because their freight rates are against them. The city bought many miles of pipe while I was in the city engineer's office and part of the time it was under my supervision. There is but little difference in the weight of cast iron pipe whether it is used for gas, water, or sewer purposes, outside of the fact that it is made by different people. The lighter weight pipe is sold by the United States Steel Pipe Co. and that is the pipe that I figured. You can use a lighter pipe for gas than for water as the pressure is lighter. It is generally known and accepted that gas pipe costs $1 a ton more than water pipe.

The figures that I have given with reference to the reproduction cost of the gas mains in this city are what I regard as fair prices for that work with a legitimate contractor's profit and would be the price which the company would have to pay to get the work done by a reputable contractor. It costs more to lay gas mains than water mains because the gas mains must be laid on a grade so

they will drain through a drip, while water mains can be laid up and down grade. It requires more care in digging trench for gas which adds to the cost of the trench. Using the proportions or scales that I have given here in digging ternches, men would rather dig a trench 5½ ft. deep than one 3½ ft. deep as the first 1½ ft. is hard to get through. When you get below 5½ ft. the
584 cost is increased. The prices of the cost of digging which I have used are based upon my knowledge of it, covering a range of a good many years. In all of these estimates that I have ever prepared for the city while I was city engineer I always added 20% for the contractor's profit. The contractor was always required to bid within my estimate on city jobs. If not, he did not get the contract. I have always considered that a fair profit and do not think a contractor could do business on less than that and maintain an organization. Of this 20%, 5% is for incidentals. You can never determine exactly what everything is going to cost and that is a fair allowance.

Recross-examination by Mr. Adams:

The city is now using cast iron pipe for sewer work but I do not know how much. It is the exception. Clay pipe is the usual thing. The weights of pipe which I used here were taken from the catalog of the United States Cast Iron Pipe Co., which is a reprint of the standard specifications of the American Waterworks Association, and the weights are head Class A, 100 ft., 43 lb. pressure. I understood from the agent of that company that this cast iron was the lightest weight pipe that they made, and for that reason I adopted it. I know that this foundry is the one that furnishes the majority of pipe used in this territory. The 43 lb. pressure means 43 lb. pressure to the square inch. I do not think any of this class of pipe is used for water systems in which the pressure runs up as high as 43 lb. The gas pressure in this city is .43 lb. to one inch.

When gas escapes through the main it is very damaging. It ruins all asphalt paving. There is a limit in the weight and thickness of cast iron pipe. They cannot make them any thinner. The external stress put upon the gas mains is much greater than the internal stress. There is not much connection in gas works of this kind between the weight of the pipe and the internal pressure.

My figures in exhibit 68 are for laying pipe in dirt streets
585 and knowing the conditions in the town. In DeWitt there are not so much obstructions to be contended with as there are here. There is no radical difference in the soil generally.

Redirect examination by Mr. Strode:

Exhibit 79 is a circular of the United States Cast Iron & Foundry Co., showing the weights of water, gas, sewer, culvert, flange pipe, and pipe fittings. Exhibit 70 is a circular of the Massillon Steel Co., showing the same. The weights of gas pipe showing in ex-

hibit 79 correspond exactly with the Class A weights of the catalog of the American company for water pipe and are the same weights that I used. Exhibit 70 shows the same weights for 4-inch gas pipe, Class A. The weights I used in my tabulations is the lightest gas pipe made by these companies.

Exhibits 69 and 70 are offered and received in evidence.

These weights appear to be the standard of the American Waterworks Co. This company ma-ufactures pipe for gas and water and their agent informed me that this was the smallest and lightest weight pipe which they made. I do not know anything about the American Gas Lighting Association or the American Gas Institute adopting standards for pipe, but their recommendations would be entitled to some consideration as well as water associations if they embodied as good pipe as could be gotten in this territory at as reasonable a price. They allow a variation of 5% in the weight. I have estimated my 4-inch pipe at 20 lb. per foot.

586 R. H. FAIR, being first duly sworn testified on behalf of the plaintiff as follows: Pages 2992 to 3028 Volume Three, Original Record.

Direct examination by Mr. Strode:

I live in Omaha and am at present construction engineer for the Northwestern Bell Telephone Company. I have been with the telephone company since 1896. For five years I was general foreman of the construction for the Nebraska Telephone Company in Nebraska and I had supervision over the underground conduits, then for two years I was superintendent of construction and had general supervision of the construction of subways and during the last four years I have been construction engineer with the duty of making specifications and figuring the cost of underground conduits construction, along with other duties. My work was particularly in Omaha and to some extent in Lincoln.

I figured the cost of the Lincoln plant very closely in connection with the selling of that plant to the Lincoln Telephone Company and during the last four or five years I have been approving estimates of costs for conduits construction for the telephone company and I have prepared in my experience an estimate of the cost of trench work such as is used here in Lincoln for trenches 22 inches wide by 4 feet deep. I have had experience in the matter of taking up and relaying pavement in connection with this trench work. For a trench 22 inches wide and 4 feet deep, covering the digging is .1123. The back filling is .084 and to these figures should be added some items which I have not yet reduced to a cost per foot basis, to cover the cost of loading teaming and moving tools and items that might be compelled by other companies for the removing of other obstructions, sewer, water, gas and other pipe that we would run across and have to get out of the road, miscellaneous labor, cleaning streets and placing guards along the trench and for caring for tools and materials and for moving store house and street car fare of the supervisory people. Thirty-five per cent of the conduits

here of the telephone company are under unpaved streets
587 and sixty-five per cent under paved streets. Twenty-seven per cent of it is practically under concrete, seventeen per cent brick on sand; ten per cent asphalt on concrete; eleven per cent stone and thirty-five per cent unimproved streets.

The average cost of a trench 65% under paved streets, in the propertions given and 35% under unpaved street, the cost is 64¢ plus per trench foot, which does not include any cost of supervision, nor engineering, above the cost of foreman on the job. The cost of hauling the surplus earth away, after it has been back filled is .054¢. The overhead expense in connection with that same work is about 20% of the figure I have given. The average cost of digging trenches 22 inches wide and four feet deep, not including paving, is 29 79/100 cents per foot. The cost of taking up and relaying brick pavement on 6 inch concrete base, is .533 per foot; for asphalt pavement on 6 inch concrete base .713. This is just the field cost and the overhead expense is 20% additional. With my knowledge and experience as an engineer for this construction, I would say that this was a fair cost, and I believe that is what the Lincoln Gas Company would have to pay in digging a trench 22 inches wide and 4 feet deep for their gas mains in this city.

Cross-examination by Mr. Adams:

The only work that I have had to do in Lincoln since 1909 was in connection with a joint appraisal of telephone plants there. Prior to that time I had general supervision of the construction of the Nebraska Telephone Company's plant in Lincoln, covering a period of about seven years, between 1902 and 1909. During that time I recall the construction of 200 feet of trench here in Lincoln for telephone conduits. In connection with that work I probably supervised the making up of the estimate, ordering the material and wrote instructions to the local people to do the work and was likely on the job some time while it was going on. It was constructed by day labor.

588 The written record of the construction cost of that trench is probably on file in Omaha with the telephone company. Most of my knowledge of trench cost is arrived at from sources elsewhere than Lincoln. I have had charge of work in Omaha, Minneapolis, Des Moines and Duluth, also Norfolk, Fremont, Grand Island and North Platte, about two miles in Omaha, one-half mile each in Fremont, Norfolk and Grand Island, and 500 to 1000 feet in North Platte. My work consisted of approving the plans and estimating the cost. The work outside of Omaha was done by day labor. I have also seen the actual cost figures and have had some within the last year in Omaha. I do not now remember what any of the figures were on any particular work.

I have directly supervised about two miles of trenches in Omaha, about half of which were under paved streets. I made up the preliminary estimates and plans, ordered the material, appointed the foreman and time keeper and was out on the work every day. The

work was done by day labor. Afterwards I saw the figures of the actual cost, showing the separate items of material and labor. I have none of the figures here. I do not remember what they actually were. The plans on part of the work showed the depth and width in trenches made in Omaha, in ducts varying from two to eight per trench. I measured some of these trenches while they were under construction, but I can not say now where they were located, nor can I tell you how many ducts there were in any trench that I measured. For a two duct conduct our specifications require a four inch concrete base at the bottom of the trench, the ducts nine inches high on a three inch concrete base and then not less than 24 inches of dirt between the top of the duct and the surface of the street, in all amounting to 40 inches. On eight duct conduits the specifications are the same except that the depth of the conduits would be eighteen inches; for a two duct conduit the specifications would require a trench 15 inches wide, and 18 inches is about as narrow as a man can dig in, and that is a practical width.

589 I regard the record of costs in the office of the telephone company in Omaha as a reliable source of information of the cost of digging trenches and laying conduits. I do not know how much of the 64 7/10 cents per foot for trench digging is for the paving. I have not got all the details. The 19 63/100 cents per foot is simply the digging the dirt out of the trench and putting back what is to go back, on unpaved streets, and includes the supervision of a foreman. The total cost of digging a trench on an unpaved street is about 30 cents per lineal foot. This is figuring part of the trenches to be dug through frozen ground.

Redirect examination by Mr. Strode:

The 35¢ per lineal foot of trench on unpaved streets is the average unit cost of what we have been able to make up from our actual cost, and is intended for our guidance in determining the price our company will have to pay ultimately for the work. The figures that I have given are not only based upon my own experience, but upon the experience of the company as shown by its records in this kind of work. Our company has built about 200 miles of trench from which this cost data is secured. The items making up the 19¢ of this 35¢ cost are as follows: For excavating on an unimproved street .1123, back filling and tamping .084. The last figures are the gross cost per thousand feet of trenches. Loading and hauling surplus dirt $54.00, night watchman $6.00, water boy $3.00, teaming, moving tools and materials $30.00, bills by other companies for moving obstructions, $15.00; miscellaneous labor, cleaning streets, paving guards and bridges, caring for tools and material and moving store house, $15.00; traveling street car, etc., $10.00. The last item includes expenses necessity incident to the supervision of the work:

Recross-examination by Mr. Morning:

This estimate was made by me for use in the Lincoln consolidation, for the purpose of getting the actual cost of that work. It is as follows:

590 Sheet 3.

South Platte Consolidation.

*Detail of Cost Estimate for Installing Underground Conduit. (Exclusive of Manholes, Latterals and Material Cost of Conduit.)*

| | |
|---|---|
| Material brought forward from sheet 2 | $217.07 |
| 270 T. R. F. T. excavation under brick pavement @ $.2753 | $74.33 |
| 170*m* T. R. F. T. excavation in brick (sand base) .1350 | $22.95 |
| 100 T. R. F. T. asphalt pavement .1579 | $15.79 |
| 110 T. R. F. T. excavation in stone pavement .1350 | $14.85 |
| 350 T. R. F. T. excavation in unpaved street .1123 | $39.31 |
| 25.64 cu. yds. concrete mixed and placed in trench @ $3 | $106.92 |
| Back filling and tamping trench 1000 T. R. F. T. .084 | $84.00 |
| Loading and hauling surplus dirt 54 cu. yds. $1 | $54.00 |
| Night watchman 3 nights $2 | $6.00 |
| Water boy 3 days $1 | $3.00 |
| Civil engineer 3 days $6 | $18.00 |
| Teaming, moving tools, material, etc | $30.00 |
| Billed by other companies for moving, obstructing sewer, water, gas, or other pipes for conduits | $15.00 |
| Miscellaneous labor, cleaning street, placing guards, and bridges, caring for tools and material moving store house, etc | $45.00 |
| Travelling, street car fare, etc | $10.00 |
| Total | $539.15 |
| Supervision 10% | 53.92 |
| Total | $593.07 |
| Total carried forward to sheet 4 | $810.14 |

Cross-examination conducted by Mr. Adams:

The figure of 35¢ or 36¢ per lineal foot for the cost of trenches dug and back filled in an unpaved street is secured from the completion reports of estimates, running back as far as 1902. We have to analyze these reports to arrive at this figure. These reports will show
591 the number of duct feet of main and subsidiary each, the number of man holes and hand holes and the total cost of material, and the total cost for labor and from those it is necessary to do some figuring in order to get this figure. This figure does not include the cost of the man holes. These figures are the cost for telephone conduits. I know nothing about what is necessary for gas mains. The conduit is about two feet high and an eight duct four way and two wide conduit is nine inches, and the amount of space occupied by conduit is considerably more than that occupied by two or four inch gas pipe, which would effect materially the amount of material to be hauled away and the cost of the hauling.

592 ROBERT MALONE, being first duly sworn, testified on behalf of the plaintiff as follows, pages 955 to 964, original record:

Direct examination by Mr. Strode:

I live in the city of Lincoln and am engaged in the contracting business, construction and concrete work, and dirt moving of all kinds. Have been in that business in and about Lincoln for sixteen or seventeen years. I have been a member of the city council, was a candidate for mayor, and am now a candidate for commissioner. I had a contract with the Lincoln Gas and Electric Light Co. for excavating for what is known as the East Lincoln holder. I think it was constructed about three years ago. I estimated the work at 90¢ a yard and made a contract for 70¢, and it cost me a dollar. The fair and reasonable cost of doing the back filling incident to that work would run about 35¢. This would vary under the specifications. It might be 50¢ or beyond because in some back filling the specifications require tamping every six inches. One would have to have the specifications to determine what the fair and reasonable price would be, and that would be true also for a part of the excavating. I estimated this job at 90¢ and then I found it was to be a very deep hole and made it 70¢ because I proposed to do that by sloping and taking a lot more dirt out than was necessary for the 70¢, but I wasn't there when the work started and they started in and dug it square and it cost me all of a dollar to do the work, because in digging it down square it caved in and if I had taken this extra quantity of dirt out it would not have caved. The fair and reasonable price for the excavating down where the plant is located would be $1.50 a yard. There is quicksand down there and a man would have to sheet pile and pump in order to get it out. By going down there and looking at it you could not determine what it would cost. You have
593 to know what is below. I have that experience in excavating in that bottom and know the character of the soil and what the difficulties are. The quicksand material is hard to handle and must be handled by hand. The cost of foundations materially increases for every foot as you go down four or five feet. The cheapest cost would be four feet. I saw them dig the excavation for the large holder down at the plant and they had a great deal of difficulty. They had to have pumps and material and they had a vicious time to get it down at all.

Cross-examination by Mr. Foster:

For the East Lincoln holder I figured an extreme depth of about 30-odd feet. By back fill I mean that the ground is taken out wider than the holder for the reason that the holder has to have a footing that is wider than the original holder, and in order to put that footing in you have to dig from the bottom clear up to the top. Sometimes they require a foot for the foundation and sometimes two feet. Once in a while they require three feet. That is all figured out by the engineer according to the weight of the holder, and the back filling covers the shoveling of the dirt back into the extra space. I

was paid $2,900 and some odd dollars for taking the dirt out on the East Lincoln holder. I have found quicksand anywhere on the Lincoln bottom between the Asylum and the other side of Havelock. It varies in depth in different places. We have always struck it within ten feet and near N street there were pockets within a foot and a half of the top of the ground. The holder down at the plant was about 15 feet deep when I saw them at work there and they were in quick-sand then. I was unable to tell when the quick-sand had started. My original estimate of 90¢ would have let me out with a profit on the East Lincoln holder had the excavation not caved in, and the estimate of 70¢ would have also let me out. The yardage was not increased by the size of the excavation caving in.

594 Redirect examination by Mr. Strode:

If I had carried on this work the way I had planned it by cutting down the sides and sloping the hole back I would have taken out practically one-third in yards of dirt than the way it was done, and would have been paid for that much more. But when the sides caved in on account of the perpendicular walls they didn't pay me anything for the dirt that I had to remove on account of the cave-in. They did pay me for the cubic yards of dirt taken from within the perpendicular walls and I had to bear the loss. As of January 1st of this year a fair price for the work of excavating that holder would be $4,000. I would not do it under their specifications for less.

595 ELLERY L. DAVIS, being first duly sworn testified on behalf of the plaintiff as follows, pages 675 to 695, original record:

Direct examination by Mr. Strode:

I am a member of the firm of Berlinghoff & Davis and am an architect. I have been a member of that firm for three or four years. I received my technical education at Columbia University. It is our custom to make guaranteed estimates of the cost of the work for which we prepare plans. We estimate before hand all the buildings we build and our estimates in the main have been verified by the figures for the actual cost. We now have on the boards and under construction in this vicinity buildings costing in the neighborhood of $2,000,000. A large number of the principal buildings constructed in this part of the state have been under the direction of our firm. Among them is the new high school building in Lincoln.

It is customary for us to issue certificates to the contractor allowing him payment for 85% of the value of the work he has completed. We actually visit the buildings under construction outside of Lincoln not less than once every two weeks, and in the city, nearly every day. All buildings for which we draw plans have been constructed under our supervision with the exception of the College of Law at the University, and a few exceptions in small buildings. On works of any importance we prepare a detailed estimate of the quantities of material to be used. We begin by making an estimate of the cubic contents of the building. After the plans are near enough completed

we prepare an itemized statement of the cost, stating the number of cubic feet or number of brick. The amount of terra cotta is estimated, the number of pounds of steel, how many feet of lumber is required, of doors, windows, casings, and so on, and of roughing, and making allowance of course for incidental expenses such as cost of foremen or superintendence, and add all of these together. We also determine the cost of materials that go into the buildings. After all of this we make an allowance to cover incidental expenses and contingencies. On a building costing in the neighborhood of 25,000 to $30,000 we make an allowance of 10% for contingencies. On larger buildings the allowance would be less. On a building costing $10,000 the allowance would be greater. On a building costing several hundred thousand dollars it would be as low as 5%.

596

I am acquainted and know the prices of material and labor required in a building during the past four or five years. There are two methods commonly employed of getting at the brick work in a brick building. One is by counting the actual number of brick and figuring the small openings as solid because the extra amount required to work around an opening is equal to the solid work. And the other way is what is called the wall measure which is an entirely fictitious way of counting and is based on the assumption that there are 22½ brick in each cubic foot of wall. Contractors usually use the wall measure but some more careful and accurate figure the other way. The fair and reasonable price for brick per thousand, wall measure, with lime mortar in the City of Lincoln during the last three or four years is $13 to $13.50 per thousand in the walls. For kiln count it is $16.90 per thousand. Brick in a wall laid in cement mortar, wall measure, would be worth $15 per thousand, and kiln count would be worth $19.50 per thousand. Three or four years ago these prices would have been slightly less but it is a fair and reasonable price for the last year.

597

The fair and reasonable cost of handling the mixed concrete is about seven dollars per cubic yard, 1-3-5. If the proportions are changed it would change the price slightly but not over 25¢ a yard. A fair and reasonable cost of a troweled-surface, 4 inch cement floor is about 12¢ per square foot for good workmanship. If you add to the thickness of it you add about 2¢ for each inch of thickness per square foot.

As to lumber used by the Gas company, the material cost is about $28 per thousand, the labor cost running from $12 to $17 or $18 per thousand, according to whether the members are large or small. The smaller members cost less per foot to handle. Joists usually figure 2-10-12, or 14, making the cost about $40 per thousand. Smaller members cost as high as $18 per thousand to handle, making $46 per thousand. A fair average would be $43. I have found these values to be fair and reasonable in my work here in Lincoln. These values do not include the 10% overhead or contingencies but they do include the contractor's profit.

The minimum price and personal equation matters depend on how badly the man bidding on the work wants to get it. If these prices

were added together with the overhead price of 10% the building could not be built for any less. That would be true at any time during the past year. During the past three or four years these prices would maintain with the exception of cement which has risen considerably in value in the last six months, having increased from $1.30 to $2.20 per barrel and the price of labor has advanced five cents per hour. The difference in the price of cement might make a difference of 50¢ per yard in the cost of the concrete.

598 Cross-examination by Mr. Foster:

One thousand brick will lay 35% more feet of wall by kiln count than by wall measure. My estimates were figured on good average brick, of the dimensions of common brick, 2¼ x 4 x 8¼, at a price of about $8 per thousand. It costs close to $5 to lay 1,000 brick in a wall, figuring on the mortar, lime, sand, labor of mixing, and tending the brick layer. There are not a thousand brick in a wall measure count of a thousand. A good brick layer will lay 1,000 brick in about 83% of the day. They draw 70¢ per hour. In 1906 in Lincoln I think they were getting less. They work 8 hours a day.

I have never examined the Gas company's buildings in Lincoln, I know nothing of the character of work in them. I have never designed or superintended the erection of a building for gas purposes. The figures I have given you are not any larger than is necessary in ordinary work. There is from 10% to 15% profit in these figures to the contractor. The cost of laying brick depends quite as much on the thickness of the joints and the quality of the work and the amount of mortar. These figures are used by our firm in making estimates. We never use the lime mortar figures in our work. We have used the other figures in every estimate that we have made, for instance in the court houses at St. Paul and Greeley, Nebr.

Our estimated cost of the Law building at the university was just a little lower than the sum for which the contract was let. That was let a little over a year ago to W. J. Ossenmacher. Unless the job is very large, hand mixed concrete is as cheap as machine mixed. On a $25,000 to $50,000 building it is cheaper not to invest in a machine for such a building. The regularly quoted price on dimension lumber is $28 which includes the contractor's profit of about 10% on some jobs. This is figured on good, sound yellow pine lum-
599 ber free from loose knots, wind shakes, or dry rot. It can have sound knots or pitch streaks and things of that sort. There has not been much change in the price of lumber in the last two or three years. For the past two years on lumber we have figured from $40 to $46 per thousand. Those are the figures accepted in the course of the trade. A grand-stand down at the university is the only job I know of in the last two years in which the contract was for carpenter work solely. I made an estimate on that and the cost at which it was let was very close to the estimate. George Wilson was the contractor.

It costs more money to put the mortar on than the brick costs. Joints must be about one-half inch to be good common brick work. Sometimes less is allowed in good buildings where common brick is

used for facing and where they took special pains to make a close joint. The prices that I have given include the contractor's profit. The cement raise in price took place during the past winter. In the cement mortar we use one to two Portland or one to four natural. The cheaper requires more cement and about balances the price. Sand is either $1.15 or $1.30 a yard, and the mason's tender costs from 25¢ to 30¢ per hour. We use a good fat lime in the mortar for the brick work about which I have testified, that which is well selected and has a small percentage of clay. There are two ways of getting at the cost of brick in the wall. One is to take the wall in a building and figure the cost of brick, and the total cost of that wall, and divide the total cost by the number of thousand brick. The other way is to figure the cost of the sand, lime, brick, and all the other elements and add them together. You will get the same result by the two methods.

600 Redirect examination:

There would be an additional cost for the brick in the pilasters, columns, and cornices of the building. It is customary with a brick mason when he figures a wall on what is called the wall measure and there is a pilaster projecting out four inches and which is two feet wide, to figure the wall plus the two feet plus the four inches on each end. A pilaster would materially increase the cost of the wall. A column is figured usually four times its thickness. When I speak of a contractor's profit I mean the cost of getting some one else to do the work. I have lived in Lincoln since 1893. I was a student at the university and my father is connected with the mathematical department of the university.

601 ELLERY DAVIS, recalled for further direct examination, testified as follows, pages 974 to 983, original record:

Direct examination by Mr. Strode:

Since being on the stand the other day I have figured out the details going to make up the cost of the different units that were given by me in my testimony entering into the construction of the buildings of the Gas company. I have taken the various quantities of labor and material required for the various units from Kidder's Handbook, which is standard for architects and builders over the country, and these are the figures that will agree with the prices in this locality. As to the kiln count cost per thousand brick of $16.90, the thousand brick cost $8. A yard of sand costs $1.35, a barrel of lime, 220 lbs., $1.25. Broken stone costs 9½¢ per 100 lbs., or $2.56 per yard. A smaller size which re-enforces costs 10¢ per 100 lbs., or $2.70 per yard. The brick mason's union scale is 70¢ an hour. A stone mason's labor is 65¢ an hour. A helper's labor is 30¢ per hour. An ordinary laborer's time is 25¢ an hour. All of these material prices include a rebate to the contractor which constitutes his profit. That probably amounts to 10% or 15%. However, that represents the price which the owner in contracting work would have to pay to get the work done and no one not in the

trade can get prices any lower. The labor prices, of course, are net and it is reasonable to allow a 10% profit on these prices to the contractor.

According to Kidder, to lay a thousand common brick, kiln count, requires 2½ bbls., or 200 lbs. of white lime, and ⅝ of a yard of sand. A brick mason on a city job under a good foreman will lay from 150 to 175 brick per hour, 160 being a fair average. These prices are for straight work without any projections or windows or piers, or anything to interfere with him, with a foreman over the man all the time. For common brick work one helper will be required for every mason to carry the brick and mortar and
602 make the mortar. On this basis one thousand brick at $8; ⅝ of a yard of sand at $1.35, which makes 84¢; .91 of a bbl. of lime at $1.25, which makes $1.14, gives a total of $9.98. Allowing 30¢ for a small per cent of waste as the materials are stored on the ground, and for the brick broken in cutting, makes a total cost of $10.28 for material. A mason in 6¼ hours would lay one thousand brick. On a basis of 6 hours at 70¢ a mason would cost $4.20. 6 hours for the helper at 30¢ would be $1.80. Allowing a profit of 10% on the labor is 60¢, making in all $6.60. Add the labor and material together and we have $16.88 which is remarkably close to $16.90 about which I testified the other day. These are not figures which can be juggled or shifted. The figures used are given as the average by Kidder and the price for material is the standard price quoted in the city, and the labor prices are the union rates in this city with 10% for profit. In these figures of $16.88 I have not taken into account anything for the ratable proportion to be allowed for the foreman's time. This should be added. It is the actual practice to have a brick foreman as the masons will lay more brick.

The tendency in the past four or five years has been to increase the labor cost. I remember when masons were getting 60¢ to 62½¢ per hour, and carpenter labor was 37½¢. The foreman ordinarily gets more than the masons. It is not a fixed sum, however. The above figures were on a lime mortar. On a basis of cement mortar, that is, a combination of lime and cement, Kidder gives the following quantities: for a good lime and cement mortar to each thousand common brick I allow 160 lbs. of lime, 1 bu. of cement, and ⅝ of a yard of sand. The brick quantities would be the same and the labor quantities would be from 10% to 15% higher, it being harder to work with cement mortar. The extra cement has to be mixed
603 into the lime, which requires more common labor as well as more helper labor, and we allow 7 hours to a thousand brick instead of 6. On that basis the cost of the lime is 91¢, of the cement, $2, of the sand, 84¢, of the brick, $8, making the total material cost $11.75. 3% for storage and waste will be 35¢, making the allowance for material $12.10. The labor item for the mason will be 7 hours at 70¢ which is $4.90. For the helper, $2.10. The total is $7 with a 10% profit, making $7.70. Adding the labor and material together we have $19.80.

The figures to which I testified at the previous hearing were $19.50, showing that the figure is a fair average price, kiln count,

per thousand brick laid in cement mortar. It justifies the common quoted price of $15 per thousand, wall measure. As to the concrete, to make a yard requires 9.07 of a yard of stone of 2 inch in size, which costs $2.48; it requires 1.06 bbls. of cement, which costs $2.12; it requires .48 of a yard of sand, which costs 65¢, the total material cost being $5.25. On the cost of these materials we allow 5% waste which is 26¢. As to the labor cost, at $2 per day, it costs from $1.25 to $1.50 to make a yard of cement according to Kidder. Others say it costs $1.80. I have taken $1.40 and have verified that by estimating that a gang of five laborers at $2 and one at $2.40, the total cost $14, should be able to make 10 yards of concrete a day. 10% profit on the labor makes a total of labor, waste, material, and profit of $7.05 a yard.

The other day I said it would cost $7. I have also checked up the unit cost of rubble stone work. $8 a yard is usually considered a fair price including the profit. It is the commonly accepted price like $13 for kiln count mortar. It requires 1 yard of stone at a cost of $2, ¾ bbls. of cement at a cost of $1.33, .46 bbl. of lime at a cost of 58¢, ⅝ of a yard of sand at a cost of 56¢, the total being
604 $4.77. Allowing 5% for waste we have a total of $4.99. As to the labor, it requires 3.9 hours of mason's labor, which in Lincoln costs $2.44. 2.6 hours for a helper costing 78¢; 10% for profit makes the total labor $3.54. Add this to the material and we have a total cost of $8.23. These are the principal units entering into the construction of a building.

Cross-examination by Mr. Foster:

These are safe if the contractor is certain that he can get that much labor out of his men. And these are the units that I use in estimating the cost of the work. Of course there are certain percentages added in the end for omissions and foremanship and things of that kind.

605 C. P. Hahn, being first duly sworn testified on behalf of the plaintiff as follows: Pages 3178 to 3221, original record.

Direct examination by Mr. Strode:

I live in Lincoln and have been a general contractor there since 1881. I had contract for part of the work for the purifying house, generator house and the main electric building. The last one that I built was the generator house which was six or seven years ago. I had the contract for all of the work above the foundation. The foundation the company put up itself. I had nothing to do with the painting or wiring of the building. The contract price for the work that I did, which was just the walls, roof and floor, was $3650.00. The fair cost of reproducing the part of that building which I put up now, or any time within the last year, would be 15% to 18% more. For the brick in the wall on mason measurements, I figured at that time $13.75 per thousand, and for kiln count that would be $18.75. The cost of buying the brick and

putting it there now in the walls, would be from 15% to 18% higher than that. The roof would cost probably 10% more than it did then and the sand and cement would run from 15% to 20% more.

I built the purifying house 22 or 23 years ago. I just had a contract for the brick work alone and had nothing to do with the stone wall foundation under it, or with the roof. The fair cost at the present time for the brick work there, is $13.75 per thousand, mason count and $18.75 per thousand kiln count. For the purifying house there were 224,200 brick, mason measurements, generator house 150,000 mason measurement and 110,000 kiln count, figuring the hollow tile as brick. We figures the wall space and have to figure mason measurements to resolve it into the same units as brick. The generator house did not include the concrete floors, but it did include the galvanized gutter and spouts. I had a contract for all of the brick and concrete work on the East Lincoln holder
606 and put in the masonry tank. That was on an agreed price before I started in. I received $6835.29. At that time that was a reasonable cost. At the present time it would cost about 20% more. I did the work at that time practically at cost. I sublet part of the contract to Rymer & Cauffman and paid them $2190.11 for the portion of the work which they did. Exhibit 354 shows the original bill that I paid them for the original amount. The rest of it is for extras that I bought of them. It does not show what the amount of sand that I used was.

Cross-examination by Mr. Adams:

I think the contract for the generator house was in writing, but I can't be sure. On this work I made a bid for the whole work and got it. I do not think I have now the contract for this building. I was to be paid $3650.00 for the work specified in my bid, which included all the mason and all the material in the construction of the building above the foundation, with the exception of the wiring and painting. The roof of the generator house is steel trusses covered with corrugated iron. I bought it from John Westover and paid $1100.00 for it, I think. I gave him a contract for the whole roof erected in position, for $1100.00. I paid $7.50 per thousand F. O. B. of gas works, for the brick and got them of Yankee-Hill Brick Company. At that time the ordinary price at which brick were selling was $7.00 per thousand and I paid $7.50 because I got an extra good brick. It was better than the average kiln run. When I took the job they specified that there would have to be an extra hard brick for the outside and that represents the extra cost. I returned the specifications when the job was finished. There were actually 186,600 brick in the purifying house. I made these figures up from measurements which I took about two months ago, but part of them I made from my notes which I had left from putting up the building. The brick is $7.50 per thousand the labor is $3.75 per thousand, the sand is $1.00, the cement $3.50. That totals
607 $15.75. I do not think there was any lime used in the mortar of the water gas building. If there was the cost would

be a little less than $15.75. I bought this cement on the basis of $2.00 per barrel. Exhibit 365 is the memo. I made of cost of the items entering into the construction of the water gas generator house, about which I have been testifying.

Exhibit 365 is offered and received in evidence.

John Lanham and I were partners on the purifying house contract. We had a written contract. We were paid so much a thousand for the brick work and my share of it, as I recollect, was $3172.00. We were paid by mason measurement at $13.00 per thousand and I figure 186,600 brick on that building, kiln count, and there were 244,200 mason count. The mortar we used was part lime and part cement. We paid $7.50 per thousand for the brick used. They were a little larger than the ordinary brick. I had a written contract for the masonry work in the East Lincoln holder. I haven't it now. The contract was for $6835.29. For that I was to lay the brick and do the concrete work, and was also to put in the bolts that hold some part of the holder to the top of the brick work, but I did not furnish the bolts. The brick cost me $7.50 per thousand and in addition had to pay the extra switching out there, amounting in all to about $7.75 per thousand. The specifications required vitrified brick. They always cost a little more than the common kiln run brick. The actual count of brick in that holder was 242,353. I sublet the concrete work to Rymer & Cauffman. I do not have the number of yards. I do not remember anything about selling the gas company 8,000 brick on May 1, 1909 for $7.25 per thousand. The transaction might have occurred, I do not remember. If I did it probably was because I was glad to get rid of them as I probably had them left over. The same is true of the sale of 10,000 at $7.25 per thousand on June 10, 1909. I built the purifying house at the East Lincoln holder and was paid by
608 the thousand mason measurement. I do not recall having a written contract. I can not tell you exactly how much I received. I built that at the same time I built the holder.

Redirect examination by Mr. Strode:

I am not in the business of selling brick and if I ever sold the gas company any, it was some that I had left over. I have done the brick work on the Orphanage Home, for the Missouri-Pacific Depot and the Burlington Freight House, and I could name over seventy-five or eighty other jobs that I have had in town, and I have actual knowledge of buying brick, and the labor entering into the construction of a building and have had to pay for it and my knowledge is not theoretical.

Recross-examination by Mr. Adams:

I have also done some small jobs for the Lincoln Gas Company on the basis of the cost of material and labor and percentage.

Redirect examination by Mr. Strode:

The difference between the $18.75 per thousand and $15.75 per

thousand, is made up for the opening for the mortar. The mortar joint alone costs one-fifth in a solid wall.

Recross-examination by Mr. Adams:

The $15.75 according to my testimony, as I gave it first, includes the entire cost of buying and laying a thousand brick, actual number, in the wall, with cement labor and mortar.

Redirect examination by Mr. Strode:

But that does not include the laying of 1000 brick along with other thousands of brick inside of the wall.

609 Recross-examination by Mr. Adams:

I have not been doing any building of any consequence during the last two years, because I have been sick most of the time.

Redirect examination by Mr. Strode:

Mr. Morning consulted me at one time.

Recross-examination by Mr. Morning:

You asked me at that time what I got for the East Lincoln holder and I couldn't tell you exactly. Exhibit 366 is a memo. made by me of the elements entering into the purifying house and from which I testified.

Exhibit- 364 and 366 offered and received in evidence.

610 GEORGE K. ABEL, being first duly sworn testified on behalf of the plaintiff as follows: Pages 3410 to 3436 original record.

Direct examination by Mr. Strode:

I live in Lincoln and am a member of the firm of Abel & Roberts. We are engaged in general contracting, paving sewers and railroad work. I am a graduate of the State University. I have done a great deal of paving in this city and I have had much experience in removing dirt in connection with that work, and we had a contract for constructing concrete reservoirs for the city, and I have become acquainted with the cost of removing dirt under varying conditions in this vicinity. I figured on the excavation work for the East Lincoln holder and am acquainted with the nature of that excavation. I estimated $1.50 a cubic yard on that job. The bottom of that holder was a cone and allowed practically no slope. If it had had a large slope or it had been a dig job so that machinery could have been used, we could have done it for half. If forty cents a cubic yard is a fair price for the excavation of the East Lincoln holder, our firm would not get the contract. The conditions are different on each new job. The price depends upon the season and whether or not you have got a team outfit that is not at work. A contractor

would rather have his teams at work even though he didn't make much of anything, than to have 15 or 20 teams standing around. If the season is right and there is lots of work being done, it would cost probably twice as much as other seasons and one must know the conditions before giving a fair estimate.

This was practically dug straight down and instead of a flat bottom it was a cone, which had to be hand finished, and if you went two or three inches too deep you would have to replace it, as the bottom was concrete. Malone had the job on the East Lincoln holder and when he had pretty nearly reached the bottom there was a big rain and it commenced to cave in. That cone was eight or ten feet high. The cost of an excavation is regulated by the depth.

611 The price for the excavation for the buildings and the holder on the Salt Creek bottom would depend upon the time of the year. There is a time in the year when the floods come up over that whole bottom and the contractor when bidding on the work takes into account the local conditions. We had two jobs down there on the M street sewer which we did for $1.50. They were eleven or twelve feet deep. We did the excavating for the two reservoirs for 30 cents, but that was part of the whole contract and we bid low on the grading and high on the extra work. It was an unbalanced bid. There was a whole lot more of extra work than there was of the grading. The fair price for that work would be around 35 cents per yard as the excavation was not very deep and we had an elevated grader and that was not loaded by hand. We had the free use of the machinery. The prevailing price for the removing of dirt in street paving is from 40 cents to 50 cents per yard; there we can use machinery and haul it away. That is a very different proposition from digging a trench or excavation for a holder. You do not have any caving on streets. During the last year we have put in four or five miles of paving here.

Cross-examination by Mr. Adams:

The grading in connection with the streets which I speak of, is commonly called extra grading above the average grade. We have always got to bid below the city's estimate. The one job done by the city for 18¢ on F street between 6th and 8th in 1909 was an instance where I think the city gave the dirt to some Russians and they took the dirt and sold it down on the bottoms. Dirt can be removed at 7¢ at a profit, if you are just going to lift it out. The grading, in grading district No. 25 on Garfield street, between 27th and 30th was done for 24¢ with an overhaul of 1¢ per yard per hundred feet for all hauling of 1000 feet. The hauling of the first 1000 feet is included in the price of grading. We took the A street

612 reservoir contract for grading and excavating at 30¢ and sublet the machine work for 25¢, but then we had to do our own trimming on the banks and dig our own trenches. At that time we were all out of work and for that reason we made a low rate on our excavations in order to get the job. We hire our steam roller engineer for ten months a year and if we run out of paving

before that time is up and can keep him busy on other work, we get him for nothing. On the grading on that job I think we must have lost something. The entire job was not a job on which we figured to make money but rather to keep our organization going. For the bare concrete we got $8.50 per yard. We have not gone very strong after reservoir jobs since. We did take the job a little later on, out on Van Dorn street, but that was in the fall and winter, just like the other one. We took the contract some time in August and finished some time in November or December, just as we were finishing up our other work. The excavating on Van Dorn street was at 30¢. We sublet it for less, how much I am unable to say. The depth on A street was 18 or 19 feet and on Van Dorn street, 12 or 14 feet.

Redirect examination by Mr. Strode:

In the paving districts, the city engineer makes an estimate of the amount of dirt to be removed for bringing the street to grade, and you are required to bid so much a cubic yard for all extra dirt. The extra dirt is the grading above the top of the curb and it is six to eight inches from the bottom of the pavement to the top of the curb at the gutter and for the portion of dirt that lies above a straight line drawn from curb to curb only, do we get extra compensation for our paving, and that only is considered extra grading, and that which lies below the top of the curb is part of the cost of the cubic yards for paving the street. The city engineer makes an estimate of from 40 to 50 cents for the extra grading and if it happens to be a big job perhaps he would cut it down a little and it is this dirt that contemplates a haul of 1000 feet and for each additional
613 haul of 100 feet you get a cent a cubic yard. Where there is very little extra grading the contractor ordinarily bids low.

614 N. M. BAXTER, being first duly sworn, testified as follows: Page 811 to 833 of Original record.

Direct examination by Mr. Strode:

I am superintendent of the distribution system of the Lincoln Gas and Electric Light Company and have been since September, 1908. I have charge of all the work that is done on the mains and services and also the maintenance of the mains and services. On an average there are employed between fifteen and twenty men who are in direct charge of a foreman. These men are engaged in the work of laying mains and repairing mains. The foreman reports to me and works under my direction. His name is A. G. Erickson. He has been employed by the Company for something over twenty years, and has been engaged in this work to my knowledge for ten years.

Exhibit 19, is a map of the city showing the extent of our mains and the sizes and the streets in which the mains are located. I do not know by whom this map was prepared but I first recall seeing it when I went to work for the company in 1905, and it has been there ever since. As mains were added to our system they were

shown on this map from time to time. We can check the accuracy of the sizes of the mains as shown on the different streets every time we make an addition, or when repairing work is done, or where we have to lower mains on account of grading. The mains are constantly being repaired and extended. We learned the size of the main from the actual work in the street. There are a few mistakes in sizes on that map. On M. Street between sixth and ninth streets the map indicates a twenty inch, while there is but a sixteen inch main. We found that error when we had occasion to open the main at ninth street. There is another on O. street from sixteenth to twentieth street. The map indicates a four inch main, but there it should indicate a six inch main. There is another place on K. or L. Street between nineth and eleventh. The map indicates ten and it should be one and a quarter. There are one or two others, but I cannot recall the exact location. This map is in constant daily use.

We take the measurements of the mains added from the various work orders and locate them on the map. We have written
615 work orders for the extension of mains and services in some instances. They are first signed by me. The foreman puts on the order the location, distance from the lot line and the size of the main. After the work is done, he certifies to it. I assisted Mr. Brodnax in getting the number of feet and different sizes in the city together, and in that work we made use of this map. There are some additions on Exhibit 9 that are not shown on the tracing Exhibit 19. Exhibit 9 was originally prepared from Exhibit 19. Mr. Brodnax made a copy in the first instance on a different scale. We took Exhibit 9 and went over it street by street to be sure that there were no more mains on that map than actually existed and also to be sure that we had them all on. The errors on Exhibit 19 are corrected on Exhibit 9 without regard to whether it would be for or against the Company. Exhibit 9 is correct as to the number of feet of mains and the size. As to extensions shown on Exhibit 9 that are not shown on 19 we depended on memory in making corrections. We had access to and went through our consummers ledger and our service record, and located a consummer or a service on the end of each stub, and in that way we made a practical verification of the correctness of the additions to the map. The service record would be a complete verification since 1905. Prior to 1905 the presence of a consummer would verify the map. No extensions were put on Exhibit 9 without first verifying and checking out the accuracy of the extension. Exhibit 20 is a blue print of the tracing of Exhibit 19.

Cross-examination by Mr. Foster:

There is a map in the Gas Company's office dated 1901 which shows the mains in the different streets of Lincoln. Exhibit 19 is brought down to January 1st., 1913. The earliest date appearing on Exhibit 19 is April 10th., 1910, entered by John Jacob Egan. He is not now with the Company. The next entry was made June 1911 by Roy Brownell. The dates are to show that the map was corrected up to that date. Prior to the first date on that map, I put some of

the work orders on when I was first connected with the Com-
616 pany. Prior to 1908 Mr. Chenney occupied my position.

We tried to put the work orders on about once a month, but frequently they were not put on that often. The orders in their original form are bound in a book in duplicate. When the work is completed and the order returned to the office it is inserted in this book and kept there, and as the mains are entered on the map from the work order there is a mark placed upon the order designating that fact. We had all of the work orders for the mains that were laid with one exception. That was the mains from University Place o Havelock. That was a job of 18,500 feet of 4" pipe, commencing pposite the Dairy Building at the State Farm and ran into Havelock at about 13th. and Howard Streets, I think. The monthly report to ur New York Office contained all of the work orders for that month. he report is made by one of the boys in my department; no check is made of it. The monthly reports are consolidated into an annual eport. I have worked on this report off and on since 1905. They ow the correct number of feet added to all sizes of mains since 1905. ie figures in the column "In Use Close of this Year" in our annual port to the best of my knowledge are wrong. I did not know it til we took this inventory when we made a summary of the mains licated on Exhibit 9. I had no way of verifying the correctness o. the figures in these reports, and do not wish to make any statement as to whether they are correct or not. The figures have been carried down from the dim and distant past, and there is no way of checking the actual amount of mains in a system of this kind without platting them and laying them out on some map and scaling them off. I have never made any comparison between Exhibit 19 and the map in the Company's office dated 1901, and I do not know who made the 1901 map. Outside of the errors shown in my direct examination there are no changes on Exhibit 9 from Exhibit 19.

Redirect examination by Mr. Strode:

We have never made any use of this 1901 map. In start-
617 ing in on this work, we verified the fact that we had a main on a street as shown on Exhibit 19 by the fact that we had customers on that street and from our own knowledge of the main being there acquired from repairing the main and our information of the mains that are shown on Exhibit 9 does not depend upon the fact that they are shown on 19, but the fact that the mains are there and in service. So far as I know this is the first attempt that has been made by the Company to get at the correct amount of mains and the size of the mains that the Company has in Lincoln.

Recross-examination by Mr. Foster:

Exhibit 19 is not correct. There are one or two other errors there than those I mentioned. I am unable to remember all of the mains and their size and location without refreshing my recollection from the map. I discovered the errors on Exhibit 19 by going over Exhibit 9 street by street and block by block, and with the assistance of my foreman I was able to correct that map.

TORN PAGES

N. M. BAXTER, recalled for further direct examination: Page 842 to 852 of Original Record.

Direct examination by Mr. Strode:

Since adjournment of court I have prepared a statement showing the extensions and additions to the mains in the city from those shown on the tracing of 1905 and Exhibit 9. The statement shows the sizes of the mains and their location. With the use of the tabulation and the map of 1905 and Exhibit 9 I can locate definitely each one of these extensions and corrections. Exhibit 22 is the tabulation I refer to. It is a correct statement of the extensions, additions and corrections. In the Exhibit the tracing of 1905 is referred to as Exhibit 19 and Exhibit 9 is referred to as a map. Under the heading of each column is given the number of feet and the sizes of the mains. The figures from Exhibit 19 are in actual feet; from Exhibit 9 the figures are in scale feet. If any one wishes to
618 make a comparison of the figures between 9 and Exhibit 19, he must keep in mind this distinction. There was not enough difference to warrant our extending it. I have verified the correctness of the additions and extensions and corrections from my own experience and the experience of my foreman. We know that we have in actual service the mains indicated in Exhibit 22 and not shown on Exhibit 19 by reason of the fact that services have been connected with the various places and we have opened the ground for extending the service or for repairs, and when that was done we were able to get the exact size of the mains in the different parts of the town.

Cross-examination by Mr. Foster:

The information authorizing the additions to Exhibit 19 was secured from my own experience and from the street foreman. I did not check them with the work orders. I know that there was 600 feet of 2 inch main at the place designated on Exhibit 22, Holdrege west of 21st. Street by knowing approximately how far that main extends on Holdrege Street. I do not know where it commenced. We get the length of the extension by measuring from the property line, and the item refer-ed to means that it extended 600 feet west on Holdrege Street west of the property line of 21st. Street. The second item in Exhibit 22 begins at the east property line of 22nd Street, and runs towards 23rd. Street 175 feet. The 7th. item where the main turns a corner commences at the intersection of the main. In some cases the extension may commence at the property line and the others at the intersection. If it was a straight run and no tapping off it would be from the property line.

I have verified the extensions of the mains shown on Exhibit 22 from the experience of the street foreman and myself. I do not know whether any of these mains were put in by private parties. None have been made by private parties since I have been connected with the company. There are no long service pipes included here as mains. Private parties do not pay for service pipes. I remember

TORN PAGES

about the extension on W. Street between 22nd. and 23rd. They were laid last Summer. I remember the extension on X
619 Street between 32 and 33. That was laid the latter part of 1910. There was one on U Street between 19 and 21st. I do not know when it was laid. On that item Exhibit 19 shows 1925 in those two blocks. It shows on Exhibit 9 of 970 a difference of 155. I know the main does not run all the way through that block because Antelope Creek runs through there.

Another item is at U Street between 28th. and 31st. The tracing shows 1340 feet of 2 inch mains; the map shows an extension coming in from 28th. and also from 31st. with a total of 970 feet, a difference of 370 feet less. I do not know who put that on the tracing. On O Street between 16th. and 20th. the tracing shows 1700 feet of 4 inch mains. The map shows that it should be 6 inch mains. I do not know when I discovered the tracing incorrect, but that main has been opened twice that I know of and I have seen the 6 inch main in both places. It was opened at the Rock Island tracks on each side. I know that if the main is 6 inch at O Street, at 16th. and against at 20th. it would not be reduced between those two points because O Street is one of the main feeders to East Lincoln. On M Street from 6th. to 9th. the tracing shows 1210 feet of 20 inch Main. The map shows 1250 feet of 16 inch. There is another case where we reduced the size of the main to get it correct and found 40 feet more. I discovered this in the latter part of 1908. The size of the main changes at 6th. Street. I have seen it opened there, but I have never seen it opened at 9th Street. On L. Street west from 8th. Street the tracing shows nothing at all; the map shows 180 feet of 2 inch mains. That main was put there under my supervision 3 or 4 years ago. It runs on the south side of the street just about to where the railroad tracks crosses L. Street and a service is connected on that which runs to the Beatrice Creamery Company.

N. M. BAXTER recalled for further direct examination: Page 1669 to 1676 of Original Record.

Direct examination by Mr. Strode:

We kept a stock on hand of different sizes and had a stock on May 13th., 1913. The 4 inch pipe was purchased in the winter of 1913. Exhibit 100 is a tabulation of the weights of pipe. The pipe
620 that we had on hand is the average run. I weighed four lengths of 4 inch pipe. The scales on which they were weighed were tested as to their accuracy by Dr. Spealman, the City Inspector, and found to be O. K. That was on May 3rd., 1913. I also weighed one length each of 6 inch, 8 inch and 12 inch pipe. I have here a tabulation showing the average weight of this pipe. It is Exhibit 100. It is a correct showing of the weights of the pipe.

Cross-examination by Mr. Morning:

These lengths were picked indiscriminately from the stock. We weighed 4, 6, 8, and 12 inch pipe. They are cast iron. The 4 and

12 inch pipe was purchased in the winter of 1912 and 1913. We have just one length of 12 inch pipe on hand now. We just keep an extra length in case of a broken main. If we were going to lay a new main or make an extension, we would order it for that purpose. We had at that time on hand over 100 lengths of the 4 inch pipes, just a few lengths of the 6 inch pipe and a small quantity of the 8 inch pipe. We still have it on hand. We buy the 2 inch pipe in lots from 10,000 to 15,000 feet. That is used for gas extension, gas service into houses. I did not weigh any of the 2 inch pipe. The 2 inch pipe is wrought iron. I was just getting the weight of the cast iron pipe.

Redirect examination by Mr. Strode:

I understand that there was some controversy about the weight of the 4 inch pipe.

Recross-examination by Mr. Morning:

I do not know whether there is a variance in the weight of the 2 inch pipe or not.

Redirect examination by Mr. Strode:

Exhibit 22 shows correctly the extensions and additions shown on Exhibit 9, and which should appear on Exhibit 19. It points out the specific change in feet and where located.

621 N. M. BAXTER, recalled for further cross-examination: Pages 1741 to pages 1762 Original Record.

Cross-examination by Mr. A. D. Adams:

Exhibit 66 is a drawing showing the buildings and machinery at the works, I think it was up here on- day on the table. Exhibit 100 was prepared by me. It shows the weight of certain pieces of pipe that were weighed under my supervision. It shows that four pieces of 4 inch cast iron pipe were weighed by me. This pipe came from the stock at the plant. They were purchased approximately during the winter of 1912 and 1913. They were all bought about the same time. This 6 inch pipe were taken from the Company's stock. I do not know when it was purchased. It had not been used, and do not know how long we had had it. We only had a few lengths of 6 inch pipe at that time, and I think the last pipe of that size we purchased was in the Spring of 1910. I do not think that this piece was part of that lot. I think it antedates that purchase. The 8 inch pipe I secured at the plant. I do not know when it was purchased. I also secured the 12 inch pipe at the plant. It had not been used, neither had the 8 inch. The 12 inch pipe was purchased last fall. The 4 inch pipe that we have been using the last 25 years ranges in weight from 19 to 20 pounds. I have always figured this pipe at 20 pounds to the foot. I believe the weights on Exhibit 100 show fairly and substantially the weights of cast iron pipe that the

Company has bought during the past five years. I believe the weight of the 4 inch pipe shown on Exhibit 100 is fairly representative of the weight of that kind of pipe purchased by the Company during the last four years. I have a set of records in my office called "Main Work Orders" starting in August 1905 and they are down to date. I am familiar with the statement compiled from those orders showing the length of each size of pipe shown to have been laid. With very few exceptions that Exhibit Checks with our record of reports which we make annually. I do not know that the records are correct prior to 1905 or not. The records kept prior to
622 that time are not complete, and from what I have heard of the way the work was done in the early days, I would not be surprised if those records were incorrect. Prior to 1905 the original records of the main extensions were not complete or accurate. The annual reports prior to 1905 were in the same form as at present. There are several months in those old records starting in 1901 which shows no mains at all, and there are some months missing. We have a set of service cards commencing with August, 1905, which shows the location, length and size of pipe with each service installed. No statement has been compiled from these service cards to my knowledge. Since 1905, I believe the record of the number of services laid, as shown in the reports of the company is correct. We have a set of meter cards in my office. I do not know when they commenced to run. I know of no reason why the meter reports of the company showing the number of meters purchased each year beginning with 1903 should be incorrect. Since I took charge of the department I believe the reports are correct. I have made no investigation of the quantity of wrought iron pipe that has gone into the plant since 1902. The property owner pays 25 cents a foot for service pipe from the curb line to the meter. I do not know how long that has been in practice. I simply report the amount of pipe laid on a consummers property. We had a different method of measuring at one time. The charge used to be 25 cents a foot from the lot line. I believe that charge was made prior to 1908. It is customary for the property owner to pay for the pipe between the end of the service pipe and the meter. In such case the customer pays 16 cents a foot. We are using rigid pipe connections with the meter. Prior to using them the connections were lead. They run from 15 to 18 inches.

Redirect examination by Mr. Strode:

In selecting the 4 inch pipe for weighing we simply picked 4 pipes without any effort to pick out of the pile heavy pipe. We only have a small stock at present. Not over 20 lengths. We will be glad to take the city's expert down there and have him weigh
623 it. Where there is a large extension, it is not built on a work order. The work orders apply more particularly to small extensions and smaller repairs. Exhibit 85 shows the record of the Company as to the size and number of feet of main from 1901 to 1912. There is tabulated the number of feet and different size of

main in each year as shown by the annual reports, and there is also shown the discrepancy.

Recross-examination by Mr. Adams:

The only mains which has been laid since 1905 for which work orders are not used was that from Lincoln to Havelock through University place. The main register is in book form. We began to use it in August 1905. Prior to 1905 we had no register. The heading on Exhibit 85 is not exactly correct, it should be "Register or Orders." The present system began with 1905. Prior to that time we had another system. The oldest I have, I think is 190*a*. I can find no orders for 1904. The reports show that there was some laid in 1905.

Redirect examination by Mr. Strode:

The extensions on N Street from 7th to 17th was built prior to my connection with the Company. I do not know whether there was a work order for that or not.

Recross-examination by Mr. Adams:

That extension was laid in 1905 before I was connected with the Company, while I was going to the University; I think in the Spring.

Redirect examination by Mr. Strode:

If they had been using the work orders at that time, a work order would have been issued for it. We have taken two inventories of our meters. The inventories differed considerably from the meters shown in the New York report. There were more in the inventory, I think, I am not sure.

624 Recross-examination by Mr. Adams:

I know nothing about the invoice for pipe purchased by the company for 1912. There was doubtless pipe purchased at that time. I do not know anything about 2 miles of 6 inch black pipe being laid or where they got it. That would be wrought pipe.

625 E. W. REED, being first duly sworn, testified on behalf of the plaintiff as follows, pages 656 to 674, original record:

Direct examination by Mr. Rose:

For the last three and a half years I have been employed by the State Railway Commission as a right-of-way valuer and statistician. Prior to that time I was engaged in the real estate business for ten or fifteen years at Holdrege, Nebr. I have made an exhaustive study of real estate values in Lincoln, and obtained my information from going over very carefully the existing values of property in all parts of the city, by talking with the County Assessor and City Tax Commissioner, and real estate men, and by observing closely the property which is listed for sale and the prices which are asked and the prices

which are obtained upon real estate sales in the city. I have made returns to the Commission of the valuation of all of the property owned by the Burlington railroad in the city, aggregating some 330 acres. I have made an appraisal for the Railway Commission of the land and lots owned by the Lincoln Telephone and Telegraph Co. including the real estate formerly owned by the Nebraska Telephone Co. From this experience I am acquainted with the fair and reasonable market values of real estate in this city. I am acquainted with blocks 77 and 79 in the city of Lincoln, and have appraised a portion of block 77 which belongs to the Burlington railroad, and I have appraised other properties in the immediate vicinity of these blocks. There is one railroad track which connects block 79 with the Burlington railroad, and I know about the vacation of the streets and alleys contiguous to block 79. With the service track in use connecting the plant with the Burlington railroad the value
626 of that property for railroad purposes would be about the same as for other purposes. In my opinion the fair and reasonable value per acre of the ground in lots 1 and 2, block 77, is $3,500 per acre. Lots 1 to 12 in block 79 are of the fair and reasonable value of $4,000 per acre, in my opinion. The fact that the utility located on this ground required more space would in my opinion increase the value of the adjacent ground to that plant. Trackage facilities place property on a par with railroad property. The values I have given are naked values without reference to any improvements on them.

Cross-examination by Mr. Foster:

I have never dealt in real estate in a commercial way in Lincoln. In 1909 block 77 was assessed at 2½¢ per square foot. I do not think there has been very much change in the value of this property from 1909 to 1912. Block 77, according to my valuation, is worth about 7¾¢ per square foot. In 1909 the assessed valuation of real estate in Lincoln was about 65% of the actual selling value. By reason of the fact that this property is located in the extreme southeast corner of the block I concluded that it was worth more than the average property in the block. I valued the right-of-way in block 77 at $3,200 an acre. At the rate of $3,500 per acre the real estate in block 77 would be worth a little over $500 a lot. A lot on the east side of the block would be worth one-third more than on the west side. It is nearer to the railroad which gives it better trackage facilities. I place a valuation of $4,000 per acre on block 79 because it is a little farther east than block 77. The ground has been raised somewhat, which undoubtedly improves it as a piece of real estate, and the property immediately east of that I valued for railroad purposes at a valuation of $4,000 per acre. The values
627 I have put on these blocks is by a comparison with property valued farther east. I have actually seen the land. I used the purchase of some property near the junction by the Burlington railroad as a partial basis for my estimate on this property. The basis of my estimate here is the valuation I put upon the railroad property adjacent to this property. The railroad adjoins block 79

557

on the east and south. The property that I had the purchase price on and used in my estimate was not to exceed four blocks away. The property in the vicinity of block 79 has not changed hands for the last four or five years because it is quite isolated from the rest of the city by the railroad and is only valuable and useful for trackage, and also on account of its being close to Salt Creek and occasionally subject to over-flow. It has over-flowed twice in one year to the extent of two or three feet, I should judge. I understood that the flood of 1908 put the gas and electric plant out of business for some time. That would not have a great effect on the value of this property for the use of the Gas company as they have raised their lots to a sufficient height to avoid a recurrence of that flood. It would have an effect on its market value for general business purposes. The values I have given here are what I call the reproduction value or what it ought to be purchased for. I would be unable to say just how much the overflow would depreciate the property for the use of the Gas company. I do not think the fact that the property is being used by the Gas company increases its value over the surrounding property.

Redirect examination by Mr. Rose:

I believe that one time I read of the manufacturing plant in block 79 being put out of business by high water. At that time the water rose to a depth of one foot in the Burlington passenger station. It rained from five to six inches in this watershed in the night preceding that flood. It was a very unusual rainfall and unprecedented, to my knowledge. There have been industries built near block 79 recently. The ground in this vicinity is valuable for industrial purposes. There are a great many in the valley. The drainage channel of Salt Creek has been straightened and deepened since I have been here to prevent flooding and to give additional drainage. The only valuable sites for industries in this city are near the railroads and they occupy the low valleys around Lincoln. They are all in the Salt Creek valley except the Rock Island, which is in the Antelope valley.

628

Recross-examination by Mr. Foster:

I think block 79 is at least two feet lower than the Burlington depot. It is two or three blocks from the gas plant on block 79 to the nearest industry located in the valley. In making my valuations I have used very largely the Sales system where it was practicable. In valuing railroad property we have used what we call a per cent of increase to cover the cost of assembling and incidentally a severance damage added to the market value which I have given you on all of this property of the Burlington railroad. I took the market value, a part of which I have given you, and increased that by an addition of 25%. The railroad property in block 80 I valued at $4,000 as a market value. This property is immediately east of block 79.

Redirect examination:

The property in block 111 immediately south I placed a market value of $3,200 on, and for railroad purposes, $4,000.

629 WILL A. GREEN, being first duly sworn testified on behalf of the plaintiff as follows, pages 1393 to 1402, original record:

Direct examination by Mr. Strode:

I have been in the real estate business in Lincoln for the past twenty-five years and I am acquainted with the fair market prices for real estate throughout the city and have been for the last six or seven years, and am acquainted with real estate values in East Lincoln near the East Lincoln property of the gas company and with real estate values in the neighborhood of their plant located in Block 79. In my opinion Lots 1 to 15 in Block 2, Pecks Grove Addition, being the property adjacent to the East Lincoln holder is of the fair market value of $8.00 per front foot, which includes the lots without any improvements. There are 365 front feet which would be $2,920.00. The fair market value during the past year, of lots 1 to 15 in Block 7, Peck's Grove Addition exclusive of improvements is $12.00 per front foot, which would make the total value of these lots $4,380.00. The two lots in Block 77 have a fair market value of about $700.00 and the twelve lots in Block 79 have a fair market value of about $750.00 a lot.

Cross-examination by Mr. Foster:

My estimates of the value of the lots in Peck's Grove are based upon what I think I could dispose of them for and for what lots in that vicinity have sold for. We were offered $450.00 for a lot 50 by 71 feet in this vicinity. I can get the same price for these lots. I do not know what the Gas Company paid. There is a railroad embankment out near the Peck's Grove lots, probably two or three feet high. In making my valuation I just considered the lay of the land and it is all built up through there; it is built right up to this property and I consider those lots worth every dollar I have testified to and they would sell readily at that price.

630 In getting at the value of the lots in Block 77 I considered the price at which lots in that vicinity are held for, and sales. The man right across the street wants $500.00 for his lot and the man on the corner back of that wants $1000.00. I sold six or seven or nine lots to the Packing House right next to this for $10,000.00. That includes two O street lots. I would put the corner lot in Block 77, in at $400.00. If it was a full lot it would be worth $550.00. It is on one of the travelled streets of the city North and South. Lot 11 is worth from $400.00 to $450.00. As to the corner lot in Block 79, that is a good lot. They have trackage there and it has been filled up so that is good property. The Packing Company paid $10,000.00 for the nine lots and then tore the building down that was on them. It was about ready to fall to pieces. If the gas company

was not on corner lots in Block 79 and the trackage was there I would not be surprised that I could get $1,000.00 for them.

G. J. CULBERTSON, being first duly sworn testified on behalf of the plaintiff as follows: Pages 1402 to 1412 original record.

Direct examination by Mr. Strode:

I am in the real estate business in Lincoln and have been for more than twenty years and am acquainted with market values of real estate throughout the city. I know what the fair market value is of the property in Blocks 2 and 7 in Peck's Grove addition. I figured the fair market value of the lots in Block 2 Peck's Grove Addition at $200.00 each for the 25 foot lots, making a total value of between $2900.00 and $3000.00 for the lots in that Block. As to the lots in Block 7 the fair market value of the 25 foot lots is about 325 and of the 50 foot lots $650.00 per lot. The lots in Block 77 are worth about $800.00 for the two full lots and the lots in Block 79 are worth about $1000.00 each. That is what they were trying to make the Gas Company pay for them at the time they wanted to get in
631 there. Exclusive of the use made of them by the Gas Company and assuming that there is trackage on them, the lots in that Block would be worth about $800.00 a piece, and could be sold for that. They might not be sold at the present time, because we can't sell stuff anywhere. I think the fair market value however is about $800.00, considering that they had trackage and are pretty well filled up and are convenient to the O street viaduct.

Cross-examination by Mr. Morning:

I have seen these lots covered with water and they overflow quite frequently. They are located in what is known as the Russian settlement. If they were vacant they would sell to the Russians for from $300.00 to $500.00 a lot for residence purposes. We had a number of 25 foot lots in there listed at $200.00 a lot. These people are willing to pay more for such lots for a home than investors are willing to pay. $200.00 and $400.00 a lot don't sound big to them and they are willing to go in there in spite of the fact that the lots overflow. It is hard to sell lots anywhere now. The fact that the trackage is there lends a value to the lots. I do not think the city sewer is very far away from these lots. The nearest paving is on O street and the lots are about two blocks away from Salt Creek. There is no sewer nor city water to the Peck's Grove lots which I estimate at about $8.00 per front foot. These lots in Block 2 face on X street. Thirteen of the lots in Block 7 are 25 foot and two are 20 foot lots. There is no sewer there. I consider the fair market price of these lots, at this time, about $12.00 per front foot.

632 Redirect examination by Mr. Strode:

These lots where the plant is located are not enhanced for residence purposes with the railroad track there. They would have to sell on the market for business purposes and that is the value that I placed

upon them when I said they would be worth $800.00. For the purposes of the company they are worth $1000.00. That is what they were asking for them when the company went there.

Recross-examination by Mr. Morning:

If the company traded the lots on the old site for these lots, they would furnish a criterion in a way, as to their value, because the old lots would have some value. I add a good deal of value for the reason that they are used by the company and there is a track there.

J. V. PURBAUGH, being first duly sworn, testified on behalf of the plaintiff as follows: Pages 1413 to 1423 original record.

Direct examination by Mr. Strode:

I am engaged in the real estate business in the city of Lincoln and have been for a little more than four years and I am acquainted with real estate values throughout the city and have been during that time. In my opinion the fair market value of the lots 1 to 15 in Block 2 of Peck's Grove Addition, is about $400.00 for a 50 foot lot and $200.00 for a 25 foot lot; for Lots 1 to 15 in Block 7, their fair market value is about $325.00 for 25 foot lots and $650.00 for the 50 foot lots. The ground in Lots 11 and 12 in Block 77 has a fair market value of about $600.00 and the lots in Block 79 have a fair market value of about $800.00 or $900.00 a lot, for trackage. If the streets were vacated and a portion attached to this property, the added value would be figures from this same price.

Cross-examination by Mr. Foster:

633 I know of sales of real estate located near Block 79 within the last two years. I base my judgment on value of this property, on the location of the ground as trackage. We sold some residence lots three years ago at 1st and C for $500.00. There is no first class residence property in this district. There is not a great deal of difference between what I sold there and this further North. We have sold and have for sale a few lots down in this bottom. We have sold a good deal of stuff West of Salt Creek. Single lots are not worth as much for trackage as a large piece of ground. One lot would not do a man who wished to put up a wholesale house or a factory, much good. The nearest we have sold to the Peck's Grove lots, is on 22nd and Holdredge. I base my value on the ground in Block 2 and Block 7 because it is high and sightly and it has water, gas and electricity. A man could go out there and put in a sewer and cement walks and he would have lots that would sell and I would undertake to sell them if that was done. It does not add much to the selling price. It is only a block to the interurban street car, north.

Cross-examination continued by Mr. Morning:

Our firm has for sale five or six lots just across the viaduct on the road leading West and we are asking $500.00 a lot for them. The

old channel of Salt Creek runs through the middle of them. The lots in Block 79 are worth twice as much as the lots which we have for sale. There is a great demand for trackage. The railroad company will not build it for you, you have to pay them for it. The Gas Company would have to build its own trackage. The trackage excludes the property for use for residential purposes. We have turned down some good concerns the last two or three years because we could not find the trackage. The railroad company that has the trackage makes a difference in the value of the lots. There are not as many people wanting trackage as there are who want residence lots, but it is much harder to get the trackage.

634 When the Packing House people came here, we wanted to locate them on the West and North side of the viaduct, but when they found they would have to build their own track, they came down to where they are and paid $9000.00 or $10,000.00 for the nine lots, including those two against the O street viaduct.

Redirect examination by Mr. Strode:

Lots further away from the viaduct are worth more than lots under it.

O. R. MALLAT, being first duly sworn testified on behalf of the plaintiff as follows: Pages 1646 to 1660, original record.

Direct examination by Mr. Strode:

I am purchasing agent with the Gas Company and have been since March 1912. I purchase everything required by the company and have charge of that department and store room, offices and plant stock. I approve of vouchers for payment and purchase pipe for the distribution system. In the recent past our pipe purchases were usually made from the United States Cast Iron Pipe & Foundry Company. I have never purchased any pipe from R. D. Wood & Company, nor have I ever seen any record of any purchases from those people; and they have never quoted any given prices nor had a representative to see me. It is part of my duty as purchasing agent to ascertain what are the best prices obtainable and in doing that I have correspondence with supply houses. The Western Supply House also sells pipe here, wholesale. Exhibit 89½ is a letter from the Massillon Iron & Steel Company of Chicago, giving the standard weights of water pipe as adopted by the American Waterworks Association in 1908 and stating that the pipe known as Class A is the type being furnished to gas companies. That letter was received by me in answer to an inquiry made as purchasing agent of this company, on or about May 5, 1913.

635 Exhibit 90½ is a similar Exhibit received from the Sheffield Company of Sheffield, Ala. It was received May 7, 1913. That company has supplied pipe in this territory. Exhibit 91 is a letter from Massillon Steel & Iron Company and in answer to an inquiry on the price of cast iron pipe for the years 1906 to 1912. It was received on April 14, 1913. Exhibit 92 is a letter received from

the Western Supply Company concerning the price of steel pipe in sizes three-eighths of an inch to two inch, from 1907 to January 1913. They operate in Lincoln. Exhibit 80½, 90½, 91 and 92 offered and received in evidence.

Exhibits 93, 94, 95, 96, 97, 98 and 99 are part of the files of the Gas Company and are offered and received in evidence. In 1904 and 1905 the period of time covered by those letters, the company was purchasing pipe from the United States Cast Iron Pipe & Foundry Company. I am unable to produce a statement here, showing what the company has paid for some of its pipe purchases during the year mentioned. The records of the company are not kept so that you could find it all. Two or three cars of four inch cast iron pipe have been purchased since I have been purchasing agent for the laying of gas mains in Lincoln and in the suburbs. I can not give you the prices off hand. There is no discount of the quoted prices on purchases of this kind, so far as I know. Some things have a discount but there is none on pipe. I have never made any effort to get quotations from R. D. Wood & Company of Philadelphia. I make the actual purchase directly in buying pipe. Some of our contracts are made by Doherty & Company for us, for such supplies as meters, motors and transformers, which of course are in the electrical department, except meters.

636 Redirect examination by Mr. Strode:

The meters and gas equipment of the plant would come directly through the Doherty people. At the end of each year, on meter purchases, I think the company gets a credit backing from Doherty & Company. The books of the company would show the purchase of a car load of pipe but would not show the weight, feet or size, but back of the books are the vouchers on which would be itemized the size of pipe and the price per foot or ton and these vouchers are available for the use of the city or anybody else. I have some of the vouchers right here. Here is one from the Sheffield Cast Iron Co. showing the weight of four inch cast iron pipe and the price at $30.00 a ton and the number of the car that the shipment was in.

Recross-examination by Mr. Morning:

During these years we have the actual figures. I will furnish a statement of what the vouchers show in the way of pipe purchases.

Redirect examination by Mr. Strode:

The price of gas pipe has gone down since 1904. That is shown by the quotations from these companies.

Exhibit 91 shows the average price of all sizes of pipe was $32.00 in 1906, and in 1910 the same pipe was $23.00.

637 O. R. MALLAT recalled for further cross-examination: Pages 1762 to 1769 original record.

Cross-examination by Mr. Adams:

Exhibit 92 was received in answer to a letter from me. I will endeavor to produce the letter I wrote, or a copy of it. I think the price for black pipe shown in this letter from the Western Supply Company is a fair price, such as the company would likely pay. That is approximately the price which we actually paid in the latter part of 1912. In September the price shown there for two inch pipe was $9.32. I do not remember what the company paid for pipe at that time. The figures shown in Exhibit 92 are approximately the figures the company paid. I find nothing in Exhibits 89½, 90½ and 91 going to the specific weight of pipe for any year prior to 1905. I think the prices in Exhibit 91 are fair; and the price quoted by Massillon of $37.75 net per ton, Lincoln, I think is a fair price. The price quoted by the Massillon people in a letter of April 13, 1906 is #32.35 per ton of 2000 pounds F. O. B. Lincoln. This is $5.40 less a ton than the academic price we got from them.

Redirect examination by Mr. Strode:

The quotations in Exhibit 91 for prices in 1906 refers to a whole year and to all sizes of pipe. It is a summary of what, in the opinion of those people, was the average price of pipe of all sizes, and Exhibit 98 was a quotation in reference to a specific kind of pipe on a certain date and there is a difference between the cost of one size of pipe and another.

Recross-examination by Mr. Adams:

The letter of April 14, 1913 from the Massillon Cast Iron Pipe & Foundry Co. is a general summary on pipe prices from 4 to 20 inch.

Redirect examination by Mr. Strode:

638 Covering an entire year, the price of pipe varies during the year. Mr. Selleck is at the head of the Western Supply Company in Lincoln. They are representative people engaged in the selling of pipe.

639 WILBUR C. SUNDERLAND, being first duly sworn testified on behalf of the plaintiff as follows: Pages 1883 to 1898 original record.

Direct examination by Mr. Strode:

I am a clerk with the Western Supply Company. I have been with them since 1907. Prior to that I was with them from 1897 to 1902. They are engaged in the wholesale plumbing, steel supplies and water works business. We sell pipe used by the gas company. I prepared Exhibit 92 at the request of Mr. Mallat. The price of pipe is based on Pittsburgh and when we get a change from the mills we

put it into effect here and I keep on my desk a price card showing the current prices and I went back of my files and discovered the cards for the years shown in Exhibit 92. I made these prices up from the cards I found, going by the dates on which we used the prices to our regular trade. The prices shown on Exhibit 2 are the fair market prices of pipe on the different dates for less than car loads. In 1900 the prices of wrought iron pipe were almost twice as high as they are now. They are lower today than they were a few years ago. They fluctuate. The price cards I have referred to are marked Exhibits 113 to 133 inclusive. They are tendered to counsel for the city.

Cross-examination by Mr. Adams:

These cards show the net prices on the various sizes of pipe delivered in Lincoln. The printed matter on the card is merely a list of prices, the first column gives the nominal size, the next the price per foot. On each card is the standard list on pipe. That hasn't changed. The cards are all alike so far as the printed matter is concerned without regard to the date, but the matter written in in pencil or pen is the important part on the price. These cards cover the time from 1907 to 1912. The standard list went into effect in 1900 and 1901. The pipe furnished has not been wrought
640 iron pipe for a good many years. These prices are on merchant's pipe. I presume it means steel pipe. All the pipe we sell is termed as Merchants wrought iron pipe. They don't use the wrought iron pipe any more. This is what we send in filling all orders for black or wrought iron pipe and if we sent the wrought iron pipe the price would be higher and the man would kick on the price. Mr. Mallat telephoned me one day and asked me to give him the price on pipe for some time back on the kind we had been selling to the gas company during those years, up to two inch in size. Nothing was said about the price for we had sold pipe to the company. The prices shown on Exhibit 132 are for small quantities, less than car load lots. On September 14, 1912, the price of three-fourths inch black pipe was $2.98 per 100 feet, for 1¼ inch pipe on the same date the price was $5.83 and on 2 inch pipe the price was $9.32 per 100 feet. I do not know whether we sold the gas company a large quantity of pipe at less prices than this or not, at that time.

641 O. R. MALLAT, being recalled for further direct examination by the plaintiff, testified as follows: Pages 1931 to 1939 original record.

Direct examination by Mr. Strode:

I have gone through the original vouchers of the company, from 1907 to January 1913 to determine what the company actually paid to the Western Supply Company for pipe during the period covered by Exhibit 92. In 1908 the company purchased from the Western Supply Company some of the sizes referred to in Exhibit 92 and Exhibit 135 is a voucher for 1¼ inch black pipe, bill dated April 9,

1908 at a price of $7.25 one hundred feet. Then there is another purchase of the same size on April 10th at the same price, and another voucher for April 14th for 1¼ inch black pipe at $7.13 per one hundred feet. Exhibit 92, under date of April 13, 1908, there is a price quoted on 1¼ inch pipe of $7.13 and the same is true on April 14th. The items mentioned last are found in Exhibit 136. On April 15, 1908 Exhibit 137, we have invoice for three-fourths inch black pipe at $3.65 per one hundred and this is the same price that is referred to in Exhibit 92 under date of April 13, 1908 at $3.65 a hundred. Under date of April 16, 1908 Exhibit 138, I find an invoice for 1¼ inch black pipe at $7.13 a hundred and that is the price quoted in Exhibit 92 under that date. On April 21, 1908 in Exhibit 139 I have invoice covering two inch black pipe at a price of $11.41 per hundred, which is the same price as is quoted on that day in Exhibit 92. I have another invoice, Exhibit 140 dated April 21, 1908 covering three-fourths inch black pipe at $3.65 per hundred, and that is the price quoted on that day in Exhibit 92 and under date of April 23, 1908 I have an invoice from the Western Supply Company covering three-eighths black pipe at a price of $2.20 and that is the same price that is quoted on that date in Exhibit 92. Exhibit- 135 to 141 are original invoices and are paid by the company. They are offered and received in evidence. I have also vouchers for 1909 and 1910 prices for purchase of pipe which
642 correspond with the prices quoted in Exhibit 92. Exhibit 142 covers vouchers for the year 1909 and Exhibit 143 covers vouchers for the year 1910. They are for the same identical pipe as quoted in Exhibit 92 and are at the same prices.

Cross-examination by Mr. Foster:

These vouchers cover less than car load lots of pipe.

Cross-examination continued by Mr. Morning:

Some of the purchases run over 1000 feet and some of them run down to a very few feet. We buy pipe from local dealers altogether. We can buy it from them as cheaply as we can at Pittsburgh. The company was not buying in car load lots before 1912, not as a rule. We purchased from the Western Supply Company, Cooper & Cole Bros. and others. I am unable to give the difference in the price of purchases in small lots and in car load lots. I have bought only in car load lots since I have been with the company. I can not tell what prices I have paid without looking it up. It is worth while to buy in car load lots. When I ask for the price in Exhibit 92 I simply requested the prices. I do not think the matter of quantity was discussed. If the plant was to be built today I presume they would buy in car load lots. I do not think the Western Supply people could furnish pipe quotations on car load lots. Whenever we ask a quotation on a large quantity they have to write to the factory. They carry a large stock, but they do not furnish car load lots out of that stock.

643 JOHN LEBSOCK, being first duly sworn, testified on behalf of the defendant as follows: Pages 2696 to 2712 original record.

Direct examination by Mr. Morning:

I live in Lincoln, Nebraska and am engaged in the real estate business and have been here four years last July. I have had experience in selling and trying to sell lots in the Salt Creek bottom in the vicinity of the gas works and am familiar with the selling and market price. These lots are all of somewhat similar character. They are bottom land and are in the vicinity of the railroad. I know where the gas works are located. The corner lots in Block 79, if they were without improvements, would sell for, in the neighborhood of $150.00; the middle lots as high as $75.00 and $80.00. That is a fair value for them. I sold Lot 10 in Block 232 on A street between Third and Fourth streets, for Judge T. C. Munger, for $90.00. I would sooner have that one than two of the lots in Block 79. The railroad runs on the street immediately west of it and it is less than a block from the main line of the Union Pacific. I sold lots 11 and 12 in the same block, one of which is a corner lot, for $350.00 for the two, for Woods Bros. Henry Herzenraider bought the last two. I also know about the sale of Lots one and two in the same block. There were improved. They had a four room house on them, built four or five years ago. It was a pretty good house and they brought $650.00. These sales were all last summer. I also had for sale Lot 4 in the same block and I had a buyer for it for $65.00, but the deal fell through because we couldn't furnish the title. I also have some lots listed for sale between 1st, 2nd and 3rd streets down towards Salt Creek at about the same prices I sold these others. They are a little cheaper. I am now associated with Geo. Hagensick. I was in for a while with Harvey Bell. The people living down there in the bottom talk the German language and are called German-Russians. I am one myself. Along in the nineties when I used to live in Lincoln, I bought lots down
644 in this bottom and paid $500.00 for six. You could probably get them now for a little over $100.00 or so. These lots are between Third and Fourth streets and C and D streets.

Cross-examination by Mr. Strode:

This lot that I sold for Judge Munger is about twelve blocks from the gas works. I consider this lot that I sold for Judge Munger more valuable because Judge Munger owned it than if somebody else did. If you go twelve blocks north from 79 you would be clear out of town and down into Salt Creek. I do not know whether it is platted out there or not. If you went a little west from the gas plant you would be clear out of town and in the cornfields. When you get out there you get into the foot hills and the land is valuable and a lot 50 by 142 feet would be worth more there. I own a lot out near the new round house on a high hill, about a mile and one-fourth or a mile and one-half from the gas works. I do not

know whether you would get outside the corporate limits if you were to go a little south of the gas works or not. The limits are pretty well up south. The limits are further south than A street. I never had much experience out there, all the business I have done was down through where they live. Gooches Mill is on 6th street south of A street. West of Gooches Mill there is farming country. I do not know whether it is platted or not. When you get out south across the bottom of Salt Creek, there it is a different proposition than it is down where this block is, within three blocks of the Burlington station. If you were to go a mile east of the gas works you would be about to 14th or 15th street. The lots there are worth more than $200.00. I don't know what they probably are worth there. It would be hard to tell, they sell them mostly by the running foot. I have no idea of what they ask. Everybody knows that they would be worth more than $200.00 but I couldn't say how much, I never sold any in that locality. They would ask five or six thousand for a corner lot and if you owned one you would
645 probably want $5,000.00 or $6,000.00. It is a location that I can say nothing about. You can't sell any lots there hardly, they are not for sale. That is because of the location. It is different than it is down at Second or Third streets. Lots within a mile east of this site on Second and Third and M streets are worth $10,000.00 and $15,000.00, and you go a mile south in that Salt Creek bottom and it is just as different in value. Judge Munger's lot was within a block of the railroad on both sides. If I had a lot along side the Burlington main tract to Denver that runs out on the Sale Creek bottom, they would tap that main line and run a spur track out to that lot. If I would build a coal yard on that lot I would have trackage right there. They would make a cut off the main line for me. They would do that any time if I wanted to build a lumber yard or anything like that. They would build a spur right away. There is a coal yard there now. The tracks come right out from the main line. Every time the railroad cuts into its main line, it increases the danger and hazard for everyone that rides over that road and it takes a chance of jumping that switch every time a train runs over it. I know that they will cut the main line before they will run two miles from their yards out to the site. They put spurs wherever you want them. I have been a railroad man for eighteen years, running sections and laying tracks. I have been with the Burlington for 22 years and have been running extra gangs and putting in yards and switches. I put in a yard for them just south of Hastings in 1897 or 1898. It was a yard with four or five switches. I had no switch off of the main line at the station.

JOHN LEBSOCK, recalled for further cross examination, testified on behalf of the defendant as follows: Pages 2729 to 2737 original record.

Cross-examination by Mr. Strode:

There is no switch cutting the main line from J street to the Salt Creek bridge on this map. I never sold any lots in Block
646 80 immediately south of block 79. They can probably be bought from $150.00 to $200.00. I do not know who owns them. There are a lot that have buildings on them, and that is for the house and lots. I don't know anything about block 80 nor 81 nor 75. I don't know what those lots sell for nor what their market value is, and the same is true in Blocks 48, 71, 105, 82 and 83. The cold storage plant is in Block 83. If I had a lot there and you wanted to buy it I would ask you $10,000.00 if you wanted it for business purposes. That is in the Salt Creek bottom. I do not know whether the land in Block 83 is any higher than in Block 79 or not. I do not know what the market value of the lots of the Lincoln Packing Company is. I never had any sales through that location. I don't know anything about the lots in Blocks 80, 75, 76, 48, 49, 71, 81, 82, 83, 105, 106, 104, 107, 113, 114 and 115. Mr. Hagensick and I worked together and when we make deals together we are partners that way. I am not a partner in all his business. I did the same way when I was with Harvey Bell. I had nothing to do with his general business. I have a general business of my own. I am writing insurance for the Dwelling House Mutual Insurance Co. That is right on 12th street between N and O. Mr. Mills is the Secretary. I work for him. We have never had any lawyers. We do a straight business. It is a strictly mutual company. I have given a good deal of attention to this Mutual Insurance Co. and I have been in the real estate business all the time. I haven't devoted all of my time to it. I did business whenever I could. I haven't made any other sales in the Salt Creek bottom than those I told. I sold a house for $1,850.00 out on Pine street last summer, to Jacob Hill, then I have sold three others, I can't tell you now where they are.

647 GEORGE HAGENSICK, being first duly sworn, testified on behalf of the defendant as follows: Pages 2712 to 2729 original record.

Direct examination by Mr. Morning:

I live in Lincoln and am in the real estate business and have been for twenty-five years or more. I speak German. I have had listed for sale and have sold lots in the Salt Creek bottom, lying in the West part of town where most of the railroad tracks located in Lincoln are found. I am familiar with the market values and sale prices of lots in the vicinity of the gas works in that bottom. I haven't sold any lots there for some time. I have a lot listed for sale at $200.00. It is located between First and Second on N street

and is north and west from the gas works, which would make it south from the viaduct. I have had it at that price for two or three years. The lots around there would sell at about the same price. I have another lot listed with a five room house on it, located at 136 L street about a block away from the gas works, for $750.00. The house is not in the best condition. The lot would be worth from $200.00 to $250.00 without the house. The lots on which the gas works are located would figure at about the same rate, if they were vacant. I would not want to buy in there if I wanted an investment. I haven't made any sales down there of lots for three or four years. There hasn't been much demand. The flood of 1908 kind of stopped the demand. For residence purposes those lots on A street about which Mr. Lebsock testified would equal those this way on M and N streets. Those this way would sell quicker for manufacturing or storage house purposes than those down on A street would. In either case you could get trackage.

648 Cross-examination by Mr. Strode:

The lot I was talking about on N was lot 3 block 77. The other lot was No. 11 in Block 78. I do not recognize the property in Block 80, and I don't know what those lots are worth there. They would probably be worth more than the lots in 78. I do not know what the lots in Block 81 would be worth. The property in Block 82 and 83 used to be considered the Salt Creek bottom. The cold storage plant is on one of them. When they went in there they had to pay a pretty good price for the lots. They had to pay a good price, I suppose, to get them for the purpose they wanted them for. I don't remember whether they had to pay $1,000.00 a lot for them or not. They might have had to pay that and they might have had to pay more. I wasn't interested in the sale and didn't have any property in there. I heard at the time, but I do not remember. It is within three blocks of the gas company's ground. They probably stand at about the same elevation. When the flood came up in 1908 it submerged the Burlington station and there was water from one foot hill to the other. The Lincoln Packing Company's plant is located just a little over a block from the gas company's works. Their ground is located right on the Salt Creek bottom in the old bed of Salt Creek. They acquired that a couple of years ago. I heard at the time how much they had to pay but I don't remember. I realize that in getting a half of a block of lots together in a favorable location where they can have trackage and within a reasonable distance of the office part of town, you would have to pay more for the lots than if you got only an individual lot. There isn't much vacant space in this bottom near this location that you could get for $200.00 a lot. You might be able to get it farther west in the neighborhood for $250.00 a lot, but it is more undesirable the farther west you go. As you go east the property increases in value, except in the Salt Creek bottom. I wouldn't be in shape to say what the gas company's lots are worth. It is like putting a price on somebody else's property. You get a

block or two away from there and the values change. Upon
649 O street the valuations change each block. Block 79 is conveniently located for the gas property and has good trackage. If the gas company wanted that and tried to buy it in its own name, they would put the price much higher than to another. The railroad company had to pay much more than $200.00 or $250.00 for the lots in Blocks 81 and 82.

Redirect examination by Mr. Morning:

My testimony as to the valuation of these lots at $200.00 and $250.00 is based upon those lots I have to sell and that is what I have been trying to sell them for, for some time.

Recross-examination by Mr. Strode:

One of those lots is in Block 77 and the other is in Block 78. One of them is a 25 foot lot with a three room house on it. I have it for sale at $150.00. That is the valuation I have been talking about and it is not what these other lots or what this block of ground would sell for.

650 GEORGE P. MONAGAN, being first duly sworn, testified on behalf of the defendant as follows: Pages 2674 to 2694 original record.

Direct examination by Mr. Morning:

I am engaged in the real estate business in Lincoln and I have lived in Lincoln for about eighteen years, and during most of that time I have been in that business, buying and selling real estate. I have made a study of the property located in the Salt Creek bottoms and have sold a great many lots there. The lots farther south where there were better improvements, were higher priced. I have not made very many sales of property in that bottom during the last five years and I think the lessening of the sales at that time has been due to the floods of 1908 and 1909. These floods were severe enough to overflow the entire bottom and damage property to some extent and some five or six people were drowned. The flood inundated the ground occupied by the gas works. I am familiar with the value of vacant lots in the vicinity of the gas plant. I am acquainted with Lots 1 to 12 in Block 79 which are used by the gas plant proper. It would be a difficult question to put a value on that property if the lots were vacant, because they are not worth as much as if they are occupied. If they were vacant and in their original condition as compared with other lots in the vicinity, they ought to be worth $250.00 to $300.00, and I do not think they could be sold for more than that at the present time. I have practically given up sales of the property down there since the flood. The prices are not so good as they were before that. My estimate of the value of these lots is based upon my knowledge of the actual sales made when the sales were being consummated. I would put about the same value upon

the lots across the street west in Block 77 if they were vacant. I have also made some inquiry and investigation of the rentals of the property on side streets off from O street. At 934 P street $100.00 a month is asked for a room which is 25 x 100 feet; at 938 P street the rent is $75.00 a month, 1200 P street, which is the
651 Draper building, rents for $90.00 per month. It has a first floor and basement and is 50 x 142. 1204 P street the east room of the Draper building, rents for $80.00; there is a basement and first floor. These two rooms together would make a room with a 50 foot front on the corner. This building is a brick building. The east room is occupied by a restaurant. I do not think the west room is rented now. It was occupied by a garage.

The Brownell Block is located at 135 S. 11th street. It is a four story building, brick, with a stone front, 50 x 142 with basement. The north room rents for $135.00 a month and is occupied by a piano store. The south room rents for $150.00 a month and is occupied by a restaurant. At 143 S. 11th street is located the Stamm building. The room there is 25 x 142. It is occupied by a racket store and rents for $125.00 a month for the first floor and basement. Some of these rooms are as large as the room occupied by the gas company now, but I do not know how much space they occupy in this building. The building first mentioned, is across the street north from the Post Office and all of the cars pass it. The Draper building at 12th and P streets is one block from the regular O street car service and is on the south 12th and S. 18th street service. I would think there would be very little difference as to location between the present location of the property at 14th and O and the Brownell block and the block occupied by the racket store, so far as convenience is concerned, to those who pay the gas bills. They are within a half block of O street car line and are located on the lines running on 11th street, and are about 50 feet from the rear of Rudge &,Gunzel's store, which is one of the big stores of the city, and about 200 feet from the City National Bank, which is one and one-half blocks from the First National Bank. The First National Bank is one of the large modern office buildings in the city. Eleventh and O is the business center of the city, and the South 11th street property would be as near to the business certer as the present location.

652 Cross-examination by Mr. Strode:

The city library is located at 14th and N street-, immediately back of the office of the gas company, and they determined on this location as being the place most convenient to all of the people of the city who had to come up town to get to the library. The gas bills of the company are paid in the main by women folks, and the company's office should be located in the main, most convenient for them, in clean surroundings. I would not want it with a pawn shop on one side and a pool hall on the other, and in a place where they would have to pass two or three saloons on the way. I do not criticize the present location of the company's office and I would expect them to put their office in a clean place where the women and children could pay the bills and would have a safe place to go.

The city has grown east on O street during the last eighteen years and the best corner today is 13th and O and is within a block of the gas company's office. The new high school building has been located ten blocks east of the office with the idea of accommodating the future growth of the town and getting it located as near the center of the population as possible. The office of the gas company ought to be located in a permanent place. All of the buildings that I have spoken of are off of O street, which is the main street. In order to secure a location for the gas office you have to take into account whether or not the buildings I have mentioned could be leased at the time the gas company was looking for a location. The fact that the buildings had been there for a good many years would not indicate that the gas company could rent them when they wanted them.

Also the moving picture theaters are all located east of 13th street and in locating them, they endeavored to place them where they will be most convenient to the people who go down town. Most of the lots which I handled in the Salt Creek bottom were of a different character than the gas company's lots, in that they were residence
653 lots, and the company's property is trackage property, and it is in the vicinity of the wholesale district. The new packing plant is within a block of it and while it is objectionable for residence purposes, it is not to the town. It is right in the vicinity, and the lots were bought for the purpose of a packing house and that would be something similar to the situation of the gas plant. The fact that the trackage is there would help the value of the lots so far as a business proposition is concerned, but not a residence. The flood hurt the value of some of the land for residence purposes, because it drove the people out of the bottoms, but when they came to suing the railroad company for damages, the value went up higher than it was ever known to have been before. I have had no experience in selling property in that vicinity for business purposes and what I have referred to is my experience in the sale of lots for residence purposes. I do not know whether the value per lot would be increased by reason of the property being altogether or not.

Redirect examination by Mr. Morning:

Seven or eight years ago I sold a lot in Block 140 for $150.00. It was located between second and third and H and J streets, two or three blocks east of Salt Creek and south of the J street grade of the railroad company. I sold, seven or eight years ago, Lot 11 in Block 140 and Lot 5 in Block 168 which adjoins 140 and 12 in Block 139. Those in 168 and 169 I sold for $200.00 a piece. They are all east of second street and South of J. They were all 142 x 50 feet. The main line of the Burlington to Denver is on the west side of the block. I sold lot 12 in Block 135 for $150.00 and Lot 7 in Block 140 for $275.00; probably seven or eight years ago. These lots were much better than the gas company's lots for residence purposes. They might not be as convenient for trackage. I sold Lot 8 in Block 140 for $250.00 and Lot 4 for $80.00. There was a little depression in the ground that made this lot undesirable. I sold lot 7 in Block 283

for $85.00. Those lots are going up the creek on D and E streets.

654 I also sold lot 9 in Block 234 on 4th and F streets for $310.00, lot 12 in block 193 for $300.00, lot 9 in 139 for $200.00; lot 10 in block 139 for $175.00; lot 8 in block 170 for $200.0; lot 5 in block 228 for $190.00; lot 3 in block 204 for $275.00. These lots are all in the Salt Creek bottom near the railroad track and to some of them trackage would be available if desired. They are higher elevations than the gas company's lots. Those sales were all made eight or ten years ago and they would not sell for the same money now. Herpolsheimer's department store is a block east of the south 11th street property. That is patronized by women and children and the public generally. The ten cent stores are located between 11th and 12th streets on the south side of O. They are probably the most largely patronized stores in the city. The upper floors of the Brownell block are offices.

Recross-examination by Mr. Strode:

At one time some of the principal lawyers in town had their offices there and they have now moved out and among them was Mr. Morning. He moved up to 13th street.

655 HENRY J. AMEN, being first duly sworn, testified on behalf of the defendant as follows: Pages 2737 to 2754 original record.

Direct examination by Mr. Morning:

I live in Lincoln and am engaged in the grocery and meat business and am located at 201 F street in the Salt Creek bottom in what is known as the German Russian settlement. I own six or seven other properties. Some are vacant and some have houses on. Now and then I buy and sell real estate and I have been doing that in recent years in that locality. The people living down there consult with me about their real estate transactions and business, and I have some knowledge of the transactions that actually take place. I speak the same language as these people and act as a sort of general advisor. I sold lot 5 in Block 197 about 30 days ago for $200.00. That was a vacant lot, full size. The ground is a little higher there, and for residence purposes I would prefer it to the property of the gas company. That lot was on E street and the gas works are on M. It is still in the railroad district. I have lot 4 in Block 198 that I am asking $200.00 for. Lot 3 sold a month ago for $200.00. Lot 5 in Block 197 is about 200 feet from the side tracks. In Block 198 the lot is about a block from the trackage. These are all the sales that I have made, but other people have sold in that locality at about that same price. As to the general market value of the lots in Block 79 where the gas works are located, that is a hard question. Those lots are laid out nicely and would sell probably for $300.00 if the gas works had never been there. That was settled up before ours was, but it would sell for that, I guess. It is something no man could say,

I wouldn't want to pay that price nor say it would be worth that. My best judgment under the conditions, I would think that would sell for from $300.00 to $350.00. It depends upon how they were built up. Sometimes a man will pay $100.00 more to get next to a certain neighbor. If the gas buildings were removed these lots wouldn't be worth any more than the property right north.
656 The nearest sale that I know of recently was in Block 109. There was a lot sold there two years ago for $250.00. That had a small barn on it. I would consider that a better location than the gas works, because it is clear and nothing in sight. It lies higher. The lots at 1st and M street with two houses on it sold for $1,100.00. Each was a three room cottage. That was just a block northwest from the gas works. Mr. Foster the city attorney sold that to the Wertz boys.

Cross-examination by Mr. Strode:

I am in the meat and grocery business. The real estate is a side line. Block 79 is a well located piece of ground for the gas plant. We wouldn't want the gas plant out around Blocks 197 and 198. The location of the plant in Block 79 practically spoils Block 78 for residences, because of odors and noise. It also spoils the well water. It would not be a very good place to raise a family. Block 80 immediately east of the gas works is occupied by railroad tracks. I don't suppose you could ever buy it. It has only one track on it but the B and M railroad has paid an enormous amount of money to people who lived in there. They had to pay more than $250.00 a lot to get the people out. I don't know what the fair market value would be of the lots in Block 80. I know the lots in Block 75 facing on O street. I don't know what they are worth. I wouldn't float a loan of $1,000.00 on the place. The valuation is based on a business property. If a man was going to establish a business he would pay more than I would pay. It is a pretty difficult thing to get a block of ground at the present time. It was at any time since 1907. The lots in Blocks 106, 75, 105, 82 and 83 are not valuable for residence purposes. They were never laid our for anything except wholesale purposes and switching. Lot 83 is the cold storage block. You couldn't buy 81, and the railroad owns 80. Block 83 is a similar property to Block 79. The lots in Block 83 without improvements would sell for $85.00 or $100.00 a lot. They may have paid $1,000.00 but I do not believe they did. It was simply wreckage and was
657 a tough part of the city. It is not a wholesale district. There are three blocks between the cold storage plant in Block 83 and the gas plant. There is practically nothing on Blocks 107, 106 and 105. They are all tracks and Block 82 is all tracks. Curtis, Towle and Paine are on Block 82. What makes valuation is when people come in to buy. Cleaning the ground off don't make valuation. If you sell to one man for $200.00 and the next man you sell for $250.00, by the time you sell the 12th block it may be $500.00. That is the way it goes up. Block 78 is all settled up. In Block 77 they are all anxious to sell, but I wouldn't want to place a definite

estimate on it. I wouldn't say that I would obligate myself to get that block for any definite figure. I would expect to make something out of it. For buying Block 77, dwelling and all, I suppose I could buy the block and house, the whole lot and sell the houses and clean them off for $10,000.00. There is a slough through there. I could buy it cheaper than you could. I couldn't say what I would agree to get it for.

Redirect examination by Mr. Morning:

For residence purposes if there weren't any houses on Block 77 every lot could be bought from $200.00 to $250.00. That is based on my knowledge of the way lots have sold, but if a man found out I was going to buy it for a business establishment he would put the price up. If I owned the whole block 79 and it was vacant, I would not be able to find a ready sale for the whole block. It would be more valuable after I had divided it up into lots and sold some.

658 M. W. FOLSOM, being first duly sworn testified on behalf of the plaintiff as follows, pages 762 to 789, original record:

Direct examination by Mr. Strode:

I have lived in Lincoln nearly 25 years and have been engaged in financial matters and banking all my life. I have been Secretary of the Nebraska Central Building and Loan Association for the past 20 years and at the present time I am President of the Nebraska State Bank. For a short time I was the owner of a majority of the stock in the Capital Beach and Milford railway and had the direct responsibility of its management and operation. That was a street railway operating between the city and Capital Beach. I have become acquainted with what is regarded as a fair rate of return upon investments of this kind in this community, including industrials, manufacturing, and public service properties. I have also investments that do not involve in any way any hazards. In order to attract capital to invest in a property like the Gas company where there were no questions concerning its franchise there would have to be offered a rate of return of at least 8%. Where the question of the right of the company to be on the streets and the right to use the property is involved in a law-suit brought by the city and where the people have voted to refuse to quiet the right of the company in the streets, and where the legislature has authorized the city to engage in the manufacture and selling of gas—under those conditions you could not attract capital at all. Anyone looking for an investment would look elsewhere. You might be able to find those who like to speculate and they might pay something, but an investor looking for an investment would not be attracted.

659 Cross-examination by Mr. Morning:

The fact that the franchise is disputed and questioned would make it impossible to get capital. That fact would not increase the cost of

making the gas or distributing it if the company has plenty of money to run its business. I am aware that in Massachusetts public service corporations have an indeterminate franchise but they have no trouble floating their securities simply because by common consent or public policy they have assurance that they are going to be undisturbed. I did not assume that if the existing franchise question is decided against the company the public would drive the company out of business and wreck its property. It is such a hazard that no one can figure what the net earnings will be, which is the basis of the value of any security. It is absolutely impossible, with that question in the air and unsettled, to tell what they are going to be able to earn, and until you can tell what the net earnings will be you have no means of getting at its value. The fact that the legislature has authorized the city to own and operate public service utilities would justify the company in charging a higher rate unless there was some restriction or some fair proposition made if the city wished to purchase the Gas company so that the value could be determined. That the city had the power to go into the business might affect the sale of securities or endanger the business. The rate of return required to attract capital would be somewhat affected by the location. You get into New England and the rate is about 1% less. The rate here would be the same for any town of the same size in the Mississippi valley. My testimony is not based upon the assumption that Lincoln is any more hazardous for a public utility than any other city of its size and character. Business and population has been expanding and increasing constantly in Lincoln in the past ten years. There will be a substantial growth, in my judgment, in the future.

660 There is no reason that I know of why a public service corporation should not prosper here in the future. I am not now interested in any public service corporation.

Redirect examination by Mr. Strode:

Prior to the passage of the law authorizing the city to operate public utilities it was my understanding that the city of Lincoln was barred from going into business of commercial lighting. There would be a difference in the rate of return required to attract capital to a concern in which the money invested could not be taken out and to a concern in which the money could not be reclaimed. If the city or the state would enable a man to earn a fair rate permanently without further hazard or annoyance then I think they would be entitled to put it in at a lower rate than if they had to contend with a perpetual difficulty or a possibility of a future hazard constantly arising. If they have to carry the risk of their right to existence and their title, they are entitled to a much better return than those who do not carry that. The return of all manufacturing industries and industrial enterprizes is above the return upon investments in farm mortgages or upon security that is regarded good. There is a much greater hazard in these businesses that does not exist in farm mortgages and ample securities. You can buy farm mortgages and the owners can change weekly and the security re-

mains the same. It is not so in manufacturing or commercial lines, or other lines of business. In a public service corporation you not only carry the hazard of a manufacturing concern but you also have in addition to contend with the right of the public to regulate and control not only the business but the price. 15% is a fair rate of return for any manufacturing enterprize in Lincoln. The risk is not so great in wholesale establishments. 10% is a good
661 return on bank capital. 12% to 15% would be very moderate in the banking business after they have paid overhead charges such as salaries and rent.

Recross-examination by Mr. Morning:

A monopoly is a decided advantage. There has never been but one gas company in Lincoln. It was my understanding that the rate-making body in this city had the power to reduce but not the power to increase. An investment in a public service corporation where the rate-making body has power to increase as well as to decrease the rate is a good investment if they have any assurance that they will recognize their duty and increase the rate if necessary. We have competition in the banking business and in the building and loan business and in practically all other lines of business. It would be a pretty good investment if the utility has the absolute right to a fair return on its investment. I understand that Henry L. Doherty & Company have the controlling interest in this gas company. I have heard that in their literature they say that the gas business is one of the most secure and least hazardous investments and they undertake to demonstrate that it is a safer business, more stable in its income, and more gradual in its increase than the street railway business or the steam railway business or any industrial business. I have never seen any statements where they set forth any of those arguments for Lincoln. I have heard that in Cedar Rapids, Ia., they are getting 90¢ for gas and the same in Des Moines. There seems to be a sentiment abroad in Lincoln that anything that is a public service corporation or anyone that invests a dollar in them borders on being a criminal and consequently he is to be held up and robbed and not allowed a fair return on it. I base my opinion on my street railway experience.

662 FRANK H. WOODS, being first duly sworn, testified on behalf of plaintiff as follows. Pages 751 to 756, original record.

Direct examination by Mr. Rose:

I am President of the Lincoln Telephone & Telegraph Company. I have lived in Lincoln thirty years. The assets of this company are about $6,000,000.00. I am one of the owners of the Nebraska Silo Company, and am a stockholder in a good many industrial corporations in a small way. The paid up capital of the Silo Company is about $1,000,000.00. I have been a director in the First National Bank of Lincoln since about the 1st of the year. I have been in the

telephone business in Lincoln since March, 1903. I am familiar with the rates of interest demanded by investments, and loans in this community. Eight per cent to ten per cent would be a fair return on money invested in gas utilities in Lincoln for the past eight or ten years, and that return would be necessary to attract capital under normal conditions where the franchise right is determined. The fact that the franchise right is controverted and an action has been brought to eject the company from the streets, and the voters had voted against extending it and the Legislature had authorized the city to build and operate a municipal plant, would effect the rate of returns, and would probably prevent getting funds for investments at all. It would increase the hazard so that it would be necessary to raise the rate in order to get investors to take the risk. I think the hazard would be prohibitive. I do not think you could get any money for investments under those circumstances, except from people who were already in and who would have to put in more to save their investments.

663 Cross-examination by Mr. Foster:

The fact that the franchise is questioned would possibly effect the sale of the company's securities. I do not think it would effect the operation of the plant. It might affect the treatment afforded to the company by the public and might create ill feeling and embar-ass it in some ways in dealing with its patrons, but the principal effect would be in the sale of its securities, particularly if it had to sell securities to make extensions to keep up with the growth of the community. I have been connected with a great many telephone companies and was one of the organizers of the Citizens Street Railway Company in Lincoln. I am not connected with, and own no stock in the Lincoln Traction Company. The consolidation of the Lincoln Telephone and Telegraph Company and the Nebraska Telephone Company was accomplished while I was President of the first concern, and was largely through my efforts. We have now before the Railway Commission an application for an increase of rate.

664 C. B. TOWLE, being first duly sworn, testified on behalf of the plaintiff as follows, pages 790 to 793, original record:

Direct examination by Mr. Rose:

I have lived in Lincoln ten years. I am engaged in the manufacture of sash and doors. Our annual business is between $500,000 and $1,000,000. Our company in incorporated under the name of Curtis, Towle & Paine Co. I am vice-president of the company and have been for ten years. I am a member of the Commercial Club and keep in touch with the business organizations in the city and am acquainted with the rates of interest and with the rates that are demanded for return on capital invested in business which involves business risks, and have been for the past six or seven years. 15% is a fair return on capital invested in the city of Lincoln involving the risk of business and industrial operation, and would be a general

criterion for any industrial or manufacturing business. In order to attract capital to a business like our own, involving the risks that we are unavoidably subjected to here we would have to show a return of at least 10% to 12%.

Cross-examination by Mr. Foster:

This rate of return applies to other cities as well as to Lincoln. Any place where there is a risk. A business of this kind would have to show a rate of return from 10% to 12% in order to attract any capital anywhere in this country. I have never gone into a new enterprize that did not promise at least 20% to 25%. There is no monopoly in our business. And our rates and charges are fixed by competition and the prices fluctuate greatly. The demand for our goods ceases almost entirely during hard times.

665 E. B. SAWYER, being first duly sworn, testified on behalf of plaintiff, as follows, pages 794 to 800, original record:

Direct examination by Mr. Rose:

I am President of the Cushman's Motor Works, located at 20th and N streets, Lincoln, and have lived in Lincoln about 25 years. Our sales are confined to no especial territory. They extend from Canada to Texas, and from Australia to Russia. We used to have a branch in New York and we have shipped as far West as Portland, Oregon. Our trade does not depend upon local conditions. I have been in this business for nine years. Prior to that I was six years in the real estate business. I was also a member of the City Council during the pendency of the present gas controversy. I am acquainted with interest rates and rates of return on investments in this city, and know what rate is required on investments in Lincoln, which involve the risk of business and industrial operations.

On account of advertising expenses and building up of business, a return of from fifteen to twenty per cent is required in order to attract capital, in matters which involve the risk incident to carrying on of a manufacturing business. New devices constantly coming on to the market demand practically double the normal return in a manufacturing business. In 1906-7 and 8, while I was a member of the City Council Committee having under consideration the gas rate in this city there was a tendency with the committee to accept some compromise sliding scale. But our legal department at that time advised that the opportunity was open for fighting the case. That was the advice which influenced the committee in not adopting the sliding scale agreement.

666 Cross-examination by Mr. Morning:

We compete with the International Harvester Company, John Deere and in general with some one hundred and eighty-two gasoline companies. In selling the individuality of the product and the method of handling is more important than the price competition. We fix the prices on a basis that will make *is* a profit. The sliding

scale which we had under consideration provided that a rate of $1.15 should go into immediate effect and that rate should be reduced five cents each year down to one dollar, which would bring the price down to a dollar January 1st, 1911. The compromise was suggested by both parties, though I believe it was principally the Gas company's offer.

667 J. D. LAU, being first duly sworn, testified on behalf of the plaintiff as follows, pages 800 to 804 original record:

Direct examination by Mr. Strode:

I am Secretary, Treasurer and Manager of the J. D. Lau Company, which is engaged in the wholesale grocery business. I have lived in Lincoln thirty-two years, and have been engaged in this business probably half of that time. The business was established by my father, and has been followed up by myself and brothers. I have been general manager ten years. I am acquainted with business, manufacturing and with industrial enterprises here and I know what rate of return is required to attract capital to the wholesale grocery business, and what is regarded as a fair return in that business. Ten per cent to twelve per cent is a fair return for money invested in the wholesale grocery business. There is a difference in the rate of return required where the investment is secured than where there is no security except the continued success of the business.

Cross-examination by Mr. Morning:

Our business is subjected to strong, direct competition. Our success depends upon the amount of enterprise, advertising and push that we put into it. We have no monopoly. The rate of return which I mentioned is not confined to the city of Lincoln.

668 P. L. HALL, being first duly sworn, testified on behalf of plaintiff as follows, page- 852 to 862 of the Original Record:

Direct examination by Mr. Rose:

I have lived in Lincoln 15 years. I have been in the banking business in Nebraska about 29 years. I am and have been President of the Central National Bank of Lincoln since its incorporation five years ago. I was cashier for 6 years of the Columbia National Bank. I have been for the past 10 or more years acquainted with the prevailing rates of interest in the state of Nebraska. In order to attract capital to invest in the city of Lincoln subject to the ordinary business and commercial risks, during the period from 1907 to the present time, a return of from 6 to 8% should be offered. The prevailing rate of interest in Lincoln on commercial paper is 6% and 7%. Bank stock ought to yield a return of 8%. General manufacturing and commercial enterprise should be 8% to attract capital. Farm loans are based on a 40% valuation of real estate. An investment which eliminates business risks, a return necessary to attract capital is lower. As the hazard is eliminated the rates are reduced. The

hazard of the investment would be increased by the fact that the franchise of a gas company is questioned, that a suit has been brought to eject the company from the streets and an election has been held at which the voters refuse to extend the franchise and the Legislature has authorized the city to operate a municipal gas plant. These conditions would make necessary an increased rate of return in order to attract capital. It would be speculative to say how much the return would have to be increased.

Cross-examination by Mr. Morning:

There is not very much difference between the rate of interest in cities of the same size in the Mississippi Valley. The rates on bank stock are a little higher in Lincoln. That has been true until very recently. It is still a question to some extent as to whether
669 or not the same condition of resources exist. The amount of capital available fixes the rate of return. We have note as much available here as in Ohio and Indiana and our rates are higher. The rates on Commercial paper are about the same all over the United States. A man investing in manufacturing and commercial enterprises would generally expect a higher rate here than in Ohio. There would not be much difference between Eastern Nebraska and Iowa. The rates on farm mortgages in Nebraska are about the same in Illinois and Iowa. That is governed largely by insurance companies. The fact that the public has the right to regulate the rate of return on a gas plant I think justifies a higher rate of interest. That is set off somewhat by the fact that the company has a monopoly. A monopoly has something to do with eliminating the hazard. I understand that the public has no right to reduce the rate of return below the point of reasonable compensation. The rates of return I speak of are based upon the kind of business and the supply of money. There is nothing except the supply of capital that requires a higher return in Lincoln than in other cities of the same size in Iowa, Dakota, Kansas or Missouri in order to attract capital to a gas company.

Mr. P. L. HALL, recalled for further direct examination, page- 873 to 880 of Original Record:

Direct examination by Mr. Rose:

Prior to becoming an officer in the Columbia National Bank, I was for several years Secretary of the State Banking Board in Lincoln. There has been no time since 1893 when the supply of money in banks in Lincoln was adequate to the financing of the jobbing and commercial interests of the town. I do not think that the public utilities of the city have been financed locally. I understand that the Gas Company and the Traction Company, and the Electric Light Company have all secured money from outside the city. As a rule the Wholesale Grocers had to go outside for their money. That is true at the present time and the indications are that it will continue.

670 Cross-examination by Mr. Morning:

That is practically true of all cities of substantially the same size of Lincoln in this western country. Money is borrowed by the wholesale grocers in the eastern cities because the rates of interest are lower and the local banks do not have the money. That is not peculiar of Lincoln alone. A great deal of the stock *of the stock* of the Automatic Telephone Company was sold outside of Lincoln; most of the bonds were sold outside. Within the last two years there was a large amount of packing paper sold to banks of eastern Nebraska. The banks in this locality keep large deposits in eastern banks. It is required by law and exchanges. There is nothing locally that would justify or cause the panic of 1907. The local banks issued clearing house certificates and refused to pay out cash because they got scared.

Redirect examination by Mr. Rose:

Packing house paper is considered a second reserve in banking. Banks invest in that class of paper to keep their assets flexible. It has nothing to do with local interest rates. The concerns floating that class of paper are supposed to have the highest character of commercial rating. It makes the best collateral we have.

Recross-examination by Mr. Morning:

The municipal bon-s of the city of Lincoln bear 4%, and the law requires that they be sold at par. The automatic Telephone bonds draw 6% I think.

Redirect examination by Mr. Rose:

The bonds of that company represented the portion of that investment that was practically free from the hazard of the business and they sold at a discount. Some of the municipal bonds are sold locally. They are known as conversible paper. They take their prices from the New York market. The price of these securities do not effect local rates of interest.

671 C. H. BEAUMONT, being first duly sworn, testified on behalf of the plaintiff as follows, pages 863 to 872, original record:

Direct examination by Mr. Strode:

I am engaged in the banking business and am cashier of the Nebraska State Bank, and am president of a bank which we hold in the western part of the state, and vice-president of another one. I have been connected with banks in this city since 1888. I was state bank examiner for six years. I am acquainted with, and have been for the past six years back to 1906, with the current rates of interest on money. There is a differnece in the rates of return on loans secured both in principal and interest, and investments in property that carry with them the hazards of business. The rate

on secured loans in this community since 1906 to the present time, where there is a personal guarantee and the money is secured, varies from six to eight per cent, the more uncertain the security the higher the rate of interest. A return of from ten to fifteen per cent would have to be made in order to attract capital to a manufacturing or other business enterprize in this community. The amount of return would depend upon the character and hazard of the business. Where the business is firmly established the rate of return would be less then required on a younger establishment. 10% or better would be nevessary to attract capital to a concern like the Gas company here in Lincoln. Under normal conditions of franchise this would be true. The fact that the business is subject to regulation by the public and has to go up against a lot of politicians would make it considered rather hazardous. In fact a greater hazard would be present than that of the competition in other lines of business. The fact that the city is prosecuting a suit to put the Gas company out of the streets and there is a question as to its franchise, and that the legislature has authorized the city to establish and operate a gas plant without any provision
672 for taking over the property of the company, I think would make it hard to interest capital at all in this enterprize. It would make it practically prohibitive. The attack upon the company, both through its franchise and the regulation of rates, jeopardizes the investment and would affect the ability of the company to get money for extensions and betterments. The fact that there is a municipal league in this city with candidates in the field for municipal ownership also makes the investment hazardous. I would also consider the law passed by the legislature authorizing the city to engage in the gas business without any provision for the taking over of the property of the company an additional hazard.

Cross-examination by Mr. Foster:

Six to eight per cent is a fair return on commercial loans. To houses of good standing the rate is six to seven per cent. They have been getting a little lower return in Minneapolis which is a much larger city. There is very little difference in the rate on farm mortgages on property in eastern Nebraska and in Iowa and Illinois. The money loaned on farm loans is largely insurance money and the rate does not vary very much. The savings banks in Lincoln are paying 4% on a daily balance and have been for a good many years. It is higher than they are paying in Conn. I don't think the fact that the legislature was trying to reduce a high rate to a reasonable rate should, or would, affect the rate of return. Neither would the litigation referred to if it was growing out of the legislative order reducing the rate entitle the Gas company to a higher rate of return. I do not own any gas stock or telephone stock.

Redirect examination:

I do own some bank stock. If the returns are guaranteed and insured they should be lower than if they are not.

673 JOHN E. MILLER, being first duly sworn, testified on behalf of plaintiff, as follows: Pages 731 to 751 original record.

Direct examination by Mr. Rose:

I have been engaged in the General Merchandise business for thirteen years, and have lived in Lincoln 34 years. I am a director in the First National Bank of Lincoln. Our store has been at 13th and O streets for a great many years, and is known as Miller & Paine Company. Our business amounts to a million and a quarter a year. I am acquainted in a general way with the character of the public utilities in Lincoln, and was a director in the Traction Company and interested in a small way in the Telephone Company. I am interested in real estate investments in the city. I am, and have been for the past six or sight years, acquainted with the money market in this community, and my business requires me to keep track of the interest and credit rates. In order to attract capital to invest in a gas utility in this city a return of 8 percent would be necessary in my judgment under normal conditions of the franchise.

If the life of the franchise was disputed and a suit was brought by the city to eject the company from the streets, and the people had voted against extending the franchise, and the Legislature had authorized the city to build and operate a municipal gas plant, the investment would then be simply a gambler's proposition. It would require very specific knowledge and a great deal of money before I would invest under thos- conditions. A large amount of capital would not be invested under those conditions, under any terms. People having money to invest would not invest. Small amounts might be secured on a speculative proposition. Gamblers might be interested, but investors would not put any money into
674 it at all.

Cross-examination by Mr. Morning:

First class bond mortgages draw five percent to five and a half percent in this vicinity. First real estate city mortgages draw five and a half percent on the very best to seven percent in this city. We took a mortgage back on the Lindell hotel for $280,000.00 for five percent, exclusive of commissions and taxes. This mortgage runs almost indefinitely, payable $10,000.00 a year. I am unable to recall of any loan on city property outside of Savings and Loan Companies as high as seven percent, although I have heard it discussed. The seven percent rate would be on the small loans of a more hazardeous nature. Our company would have to pay six percent to six and one-fourth percent depending upon whether we secured it direct from a bank or through a broker. In the Mississippi Valley states, the rate on real estate loans is lower. In New York State and city the rate of interest is lower than here. The interest rate on commercial loans made by banks direct to business, runs from six percent to eight percent in this city. In New York City the rate does not go above six percent. The lowest rate we

ever paid here was four and one-half percent. That was for a very brief time. For the past year, with the exception of a short time in January, we have been paying around six percent. For cities of the same size as Lincoln, the rate of return on public utilities, would be affected somewhat by the locality. The farther east, the better the investment. The rate for the city of Lincoln would be about the same for any city of the same size in the Mississippi Valley. The investments are a trifler safer the farther east you go, even in the Mississippi valley. Of cities of the same size as Lincoln I would take the eastern investmenets. The hazard of the business enteres into my estimate of a fair return. As compared with first mortgages the hazard of public utilities investments is certainly greater. This is subject to regulation as to how it shall do
675 its work and its rates, and there are a great many other things which enter into a manufacturing or business proposition, and which are to be considered. The hazard in Lincoln, I do not consider any greater than in any other town under the same general conditions. Exhibit 17, undertakes to demonstrate that there is less hazard and more stability in a gas enterprise than in industrials and electric railways and street railways. The attitude of the people of Lincoln is hostile to the company, and that makes a difference. I was one of the promoters of the original Citizens Street Railway Company. When that company was consolidated with the Traction Company I received $18,000.00 in common stock, and in association with Dr. Paine, received $70,000.00 additional common stock. This we have disposed of. Up to the time of disposing of my common stock, I was a director in the Traction Company. I now own only preferred stock. Our company took about four or five thousand dollars of common stock in the telephone company, when that was organized. While I was interested in the telephone company, and a director of the Traction Company, both of these companies made application for increasing of rates to the State Railway Commission.

Redirect examination by Mr. Rose:

Farm loans demanding a rate of five percent to five and one half percent, the loan does not exceed 40% of the value of the property, which eliminates the hazard of the investment as near as anything can. The same is true of city loans. The rate of interest in the Lindell hotel mortgage was one of the considerations of the sale. It was compulsory in a large measure. It does not reflect the normal rate of interest on a security of that character. Trust funds from Savings banks and insurance companies are largely competitors for farm loans and municipal securities at low rate; they in effect make the rate and that class of money does not seek investment in
676 gas companies. There is a great difference in the rate of return required for an investment which take- the risk of industrial operation and an investment in which that risk is eliminated. The rate of one kind is not properly comparable with the rate on the other.

Recross-examination:

The preferred stock of the Traction company pays a dividend of six percent. They have out about $1,200,000.00 of preferred stock. I leave my money there because I have such a small amount and there is some sentiment connected with it. Our telephone stock was originally taken in the New Automatic Company. The common pays seven or eight percent. The Savings Bank rate of interest in this community is four percent at the present time.

Direct examination by Mr. Rose:

The preferred stock of the Traction company, is both preferred both as to dividends and distribution of assets, and the speculative feature is in the common and not in the preferred stock.

677 SILAS H. BURNHAM, being first duly sworn, testified on behalf of the plaintiff as follows, pages 965 to 973, original record.

Direct examination by Mr. Strode:

I am President of the First National Bank of Lincoln, and have been in the banking business in Lincoln since 1888. I was first cashier of the American Exchange National Bank and then President and since then have been President of the First National. The First National Bank is the largest bank here and has deposits of about four millions. I am acquainted with what would be regarded in this community as a fair and reasonable return on an investment of capital either in securities or in business enterprizes. There is a difference, in my opinion, as to the rate of return considered fair and reasonable upon an investment in security where the return of the principal as well as the interest is guaranteed, either by securities or by persons, and where the investment is in a business enterprize which depends upon its success. I would say that 10% is a fair and reasonable return in this community upon capital invested in business enterprizes, manufacturing plants, and wholesale institutions, and has been since 1906 and 1907. A rate of return would increase as the probability of risk would increase. If the business was well-established the rate would be higher. In order to invest money in a property like the Lincoln Gas Company since 1906 down to the present time under normal conditions where there is no question about the franchise I would want a return of from 10% to 15%, or the property would not appeal to me at all. I would not take that sort of an investment if I could get a 6% or 7% investment or a first mortgage on city or farm real estate. Because then I have a security that is coming due in a short time so that I could get my money and, on the other hand, I have nothing but a stock that is
678 never coming due. That much of a return is necessary to induce investors to invest in that kind of a property. The fact that the city has instituted a suit questioning the right of the company to be in the streets and to maintain and operate a gas company, and that the legislature has authorized the city to go into the

gas business without any obligation on the part of the city to take over the gas company's property at a fair valuation would affect the rate of return, in my judgment, and I do not know of any rate that would be sufficient to induce capital to invest under those conditions.

Cross-examination by Mr. Morning:

The rates I have given would, I think, apply in any locality. It depends upon the character of the business regardless of the locality. I have been interested in one or two gas propositions. I am not interested in this company now. I am naturally disposed to a conservative form of investment rather than a speculative one. There is no element of speculation in good farm loans. I have no disposition to go into the gas business and that enters into my estimate of a fair rate. The best paper here draws 6%. The savings banks' rates where they loan money is six to seven per cent on city real estate and farm property. The loans here are a trifle higher than those made by loan companies in the east. An improved farm loan has always commanded a little lower rate than a city loan. A farm loan is ordinarily conservative as to relative value and a city loan usually more nearly approaches the real value of the property and therefore the rate is a little higher. There is there an increased hazard that does not enter into the farm loan. The rates on commercial paper are substantially the same as they are in Ohio, Indiana, Missouri, and Iowa. The savings banks' rates are a trifle higher here. They pay three to three and a half per cent in the territory named. They pay four per cent for deposits here.

679 Redirect examination:

Where there is a difference between the rates here and in the east the rates are higher here.

680 Mr. Ben C. Adams, being duly sworn on behalf of the plaintiff testified in chief as follows:

Examined by Mr. Strode:

Am general manager and vice president of the Lincoln Gas & Electric Light Company; have been connected with the company since July 1st, 1906; was employed first as general ssuperintendent until February, 1909, then became general manager; have had charge, in a general way, of the operation of the plant. We have a general superintendent and then superintendents under him for different departments; our business is divided into four departments: the commercial department, sometimes called the business department; the executive office department; the plant department, and the distribution department. Mr. Baxter is in charge of the distribution department.

I have gone over the records, books and vouchers of the company, not in detail in every instance, but in a general way showing the cost of certain property, buildings and appliances the company has

on such items as were questioned on the cross examination of Mr. Lea. There is not always a construction account kept by the company complete in itself showing the cost of any particular appliance or property; it isn't the plan of the company to keep a construction account in such a manner as to tell the cost of any particular apparatus, that is, any individual apparatus; we have a general construction account showing what our constructions costs — for any year or month, showing the total for any fixed period, but not resolved down to separate items; the books are not kept for the purpose of showing what these items cost as individual items. In a way, we keep books, account and records which would show particularly the cost of the East Lincoln holder, thus, when we do a piece of construction work of that character it is customary to open up what we call a special construction account into which everything is charged that goes into the construction at that point.

681 In dealing with the East Lincoln holder by turning to that particular construction account we would be able to find all the items that entered into what we call the East Lincoln Holder construction account, items would not be separated and classified but simply entered there as they came in and were paid.

Taking the generator house, referred to in Mr. Lea's report I have compiled a tabulation under a heading on our books that appears as generator house and Otis elevator; into that account were charged all items that went into the construction during the time the generator house and Otis elevator were built, erected or constructed in connection with those two items. That generator house was constructed in 1908; this account will be found in the Accounts Payable Journal. Exhibits "31" and "32" is the compilation I refer to showing the cost of the Generator House and Otis elevator. The total cost of the Generator House and Otis elevator as shown by the records of the company and by exhibits "31" and "32" is $5,472.83, for both Generator House and Elevator. Mr. Lea gave the net construction cost of the Generator House alone at $3,737.00, and the net construction cost of the Otis Elevator at $1,060.00 making a total net construction cost shown by Mr. Lea's report for Generator House and Otis elevator of $4,799.00, and as shown by the records of the company $5,472.83, for that particular building and elevator and included no other buildings. I might say that after arriving at the grand net total I show on exhibit "32" of $5,472.83 I later deducted from that account $46.95 charged into that account in error, taking that into consideration Mr. Lea was $626.88 under our construction account. The different items entering into the total of $5,472.83 for the Generator House and Otis elevator are shown in exhibits "31" and "32."

682 And are also shown on the records of the company in the Accounts Payable Journal.

Exhibit "33" is a compilation made from exhibits "31" and "32" showing what we paid out, according to our records and vouchers to different people who furnished the apparatus or work. In a way a summary of what is shown in the other preceding pages in detail. Shows the net construction cost as shown by Mr. Lea's report and the difference between that and the actual cost.

Have examined the records of the company to ascertain the construction cost of the 7′ 6″ water gas machine, the last one installed, that is one year old. Exhibit "34" is a compilation, really a copy of our records of the construction cost of the 7′ 6″ water gas machine erected a year ago; items entered there were taken from our Accounts Payable Ledger; the first item shows contract price on generator, carburettor, superheater, seal, pyrometer and steel floor erected on our foundation being $8,000.00 which was made to us by the Western Gas Construction Company. There were other items entering into the construction of that water gas machine, item number 2 as I have it here, shows not only what was paid to the Western Gas Construction Company for the machine but also other items that entered into the construction of that machine according to our books and records.

Exhibit "35" shows the payment made to the Western Gas Construction Company, according to the records of the company, including freight, and in the amount of $7,575.00 in total; it shows an allowance was made for an old machine of $400.00; and an allowance for repairs on the old water gas machine of $25.00; adding those two items to the first total gives the total of $8,000.00, the contract price. In addition shows the items that entered into the construction, according to the company's records, of $322.94,
683 making a grand total of $8,322.94; Mr. Lea in his report allowed for the bare machine without including anything for the floor a construction cost of $8,477.00; taking the erection of the floor for the water gas set into consideration that would have to be added to Mr. Lea's figures. The different items entering into the cost of this water gas set are shown in exhibit "34," as disclosed by the records of the company. The $8,000.00 included the floor that went with that machine as per contract price. Mr. Lea's figures are higher than the figures shown by the books of the company of this particular item.

I have compiled the cost of the 7′ 6″ three year old water gas machine, from the records of the company, and is shown in the tabulation here. Regarding the second water gas machine I have made a notation on this exhibit to the effect that there is no contract for that in the company's office, but that the price made for the generator, carburetor, superheater, seal, scrubber, condenser, ten inch by twelve inch Atlas engine, number "7" blower and countershaft, also 15 feet by 28 feet of steel floor erected on the company's foundation was $10,900.00, that price was made by the Western Gas Construction Company indicated by the correspondence and letters with the company showing that was what was to be paid; those items have not been identified yet, but are now marked exhibits "36," "37" and "38." I have made a compilation of the cost of this particular water set as shown by the records of the company.

Exhibits "36" and "37" show the total net cost to the company covering the erection of the 7′ 6″ water gas machine amounting to $13,365.72; Exhibit "38" shows the amount paid to the Wester- Gas Construction Company, partly in the form of notes, partly in the

form of vouchers amounting to $10,225.00; also shows freight
684 paid amounting to $841.50, and drayage $70.00. The total of those items amount to $10,936.50 with a credit of $8.40, leaving a net amount of $10,928.10; the next line shows the total amount in the construction account; the following line shows the amount in the construction account represented by incidentals; the following line shows Mr. Lea's allowance for the erection of the set, and his allowance for the condenser and scrubber, and for the floor,—taking one half of his total amount and his allowance for blower equipment, making the total amount allowed by Mr. Lea for the items covered in exhibits "36" and "37," in part, of $12,157.00. For the same items shown in exhibits "36," "37" and "38" the company's records show $13,365.72, an actual cost shown by the company's record over Mr. Lea's estimate of $1,208.00.

I have compiled from the records of the company the construction cost of the 12 year old 6′ 6″ water gas set, which shows the contract price made by the Western Gas & Construction Company, shown by exhibit "39" and also the items entered on our ledgers that went to make up the construction account; the contract price of the Western Gas & Construction Company covering the generator, carburetor, superheater, seal, scrubber, condenser, engine and blower was $7,827.00; our construction account shows the amount of $8,763.20 as the price paid for this water set plus the additional items entering into the construction account.

Exhibit "40" shows, from the records of the company, the amount paid to the Western Gas & Construction Company an amount of $7,830.56; shows also the total construction cost from the records of the company, and what Mr. Lea allowed for the machine and foundation exclusive of engine, blower and floor, then what I estimated
Mr. Lea allowed for the blower and engine, using my estimate
685 as to what he used for the engine and blower, making his total $8,391.00; the engine and blower is included among other items in his report. It is impossible to segregate it, I took one half because Mr. Lea allowed certain amounts for the engine and blower, but the engine and blower is used for two machines. I only charged part to this machine, dividing the cost between the two machines. With this explanation that would give Mr. Lea's net construction cost as shown in his report for this water gas set $8,391.00; the records of the company show the actual cost of that machine to be $8,763.20, costing the company $372.00 more than Mr. Lea's net construction cost.

I have compiled the items of cost for what is known as the Springer water gas set; exhibit "41" shows the contract price made by the Stacey Manufacturing Company, although not marked "Stacey," on the machine erected; also shows the amount charged to the construction account during the erection of that machine by the company; at that time the company did not keep its books as we keep them now; the Journal kept at that time showed that a contract was made for a Springer set amounting to $9,100.00, then showed the amount paid out, making a total of $9,100.00; there was one other item of $4.22 in that account, but the complete charge of the Stacey Manu-

facturing Company for erecting the machine was $9,100.00; there was one additional item of expense paid by the company for erecting that machine as shown by the company's records of $84.22, since making this compilation I have forgotten what that covered: they did all the work, hired their men and constructed it at a cost to us of $9,100.00. We paid out no items that entered in there, under our present scheme of construction we do a large part of that work ourselves. Mr. Lea's net construction cost for that particular item was $4,991.00; Mr. Lea allowed for the 6'6" set and operating
686 floor $1,871.00; I have taken half of that and charged it to this machine, making Mr. Lea's total for the machine and floor $5,926.00 as against the total shown by the company's records of $9,184.22 actual cost, or $3,258.22 more than the net construction cost allowed by Mr. Lea.

I have gone through the records of the company and ascertained what they show with reference to the cost of the 500,000 foot holder; I don't know whether there was a contract for that holder, there is none in the office, but the price made for the holder and tank on our foundation was $37,500.00 as shown by the records of the company, and verified by my asking the Western Gas & Construction Company what they charged us for the holder, the company did part of the foundation work but paid for the foundation in addition to this price. I have compiled from the records of the company the items entering into the cost of that holder as shown by the company's records; exhibits "43" and "44" show the total cost of the erection of that holder as per the records of the company; exhibit "44" shows an item that does not appear in the Accounts Payable Journal entering into the construction cost shown here as "painting" that amounted later to $952.10; it is customary for manufacturers of holders to ship them with a coat of paint on in part, and if not altogether painted to give it one coat after erection, it is then customary for the company to paint it properly; we did not put on our coat of paint at the time the holder was erected, but did later, it was then done under contract costing us $952.10 which is properly a part of the construction cost of that holder. Taking the price paid of $37,500.00 and addi*d*- the additional items of construction cost as shown by our records, including the cost of foundation and
687 painting the total is $43,897.62; I can give the foundation item but that will come later on in exhibit "45."

Exhibit "45" is a compilation showing the amount paid to the Western Gas & Construction Company as per the records and vouchers of the company, including freight, and payments on foundation and excavation; we actually paid either by note or voucher $34,476.92; the item of freight amounted to $2,931.38 making the total amount paid the Western Gas & Construction Company and the Railroads for the holder $37,408.30 and in addition payments made on the foundation of $4,302.37; Rymers & Kauffman of Lincoln had the contract for the foundation. There was an additional item of $191.90 paid for excavation; I have already mentioned the item of painting of $952.10 giving a total for the foundation, excavation and painting of $5,446.37; and there were other items as shown by the

records of the company, entering into that construction and paid out by the company amounting to $1,042.95 making the total cost of that holder to the company complete of $43,897.62; Mr. Lea gave the net construction cost of that holder at $43,985.00, being $87.38 higher in his net construction cost of that holder than the records of the company show it cost, without reference to the records for verification.

I have compiled a statement as shown by the records of the company showing the cost of the 50,000 foot holder; I presume there was a contract for that holder but was not able to find that in our archives; that holder was purchased from the Stacey Manufacturing Company; our records show how much was paid for that holder erected complete on our pit, that is, just for the steel work erected,
to which we had the added expense of the excavation, founda-
688 tion work and tank; the cost of this 50,000 foot holder is
shown in exhibit "46," at the time that holder was purchased the company kept a different system of books from the present system; those items are shown on the old Journal; as shown by the books of the company the total cost of that holder for the iron work and its erection was $4,307.61; Mr. Lea in his report allowed for the iron work erected $3,494.04, costing the company $813.57 more than the amount allowed by Mr. Lea. Mr. Lea's allowance as the net construction cost of this holder erected was $10,409.00, including the tank and foundation; the items of cost of the tank and foundation are not on exhibit "46," we had no records of that part of the construction.

I have compiled a statement showing the cost of the construction of the East Lincoln holder taken from the records of the company; exhibits "47," "48," "49" and "50" cover the amount that entered into the construction account that we call the East Lincoln District holder; that amount also included the booster house, the floor and motor and all the elements that went into the work done at the East Lincoln District holder station at that time, and shows the different items and amounts paid in the way of construction cost on account of that holder. The total amount as shown by the books of the company paid for the construction of the holder including booster house, exhauster and motor $20,904.28 for the whole business. There was a separate contract for the steel or iron in the holder with the Western Gas & Construction Company amounting to $7,000.00 for the steel work erected; also a contract for excavation at 70 cents per cubic yard with Robert Malone amounting to
$2,927.96; we also had a contract with Perry Hahn for a
689 masonery tank amounting to $6,375.00, we paid him $6,-
683.27 because of some extras outside of the contract; there were no deductions made from the total cost of $20,904.28; the deductions of $1,696.96 you speak of were made to get a comparison with the items allowed by Mr. Lea. The total cost of the holder complete, including the booster house, exhauster and motor and items entering into the construction of the East Lincoln Holder was $20,904.28, that however does not include anything for land or property we purchased. Above the three items mentioned $7,000.00

to the Western Gas & Construction Company for iron and steel; $2,927.96 to Mr. Malone for excavation and $6,683.27 to Mr. Hahn for brick work, making a total of $16,611.23 the difference between those items and the $20,904.28 is made up by other items entering in there partly covered by the booster house, exhauster, motor, man holes, heaters, labor connected with putting those in and other incidental items, shown in exhibits "47," "48" and "49." Mr. Lea allowed as the net construction cost of this holder $18,685.00; the records of the company show, taking out of the $20,904.28 the cost of the booster house, exhauster, motor, man holes, heaters, and labor as shown from the records, I get a net amount covering the cost of the construction of the holder with items incident to its construction, of $19,207.32, that can be compared with Mr. Lea's figure of $18,685.00, showing by our records that the holder actually cost the company $522.32 more than Mr. Lea was willing to allow the company credit for in net construction cost. This is the same holder the City assumed early in the cross examination to cost $13,000.00 assuming to have all our contracts when they only had a portion of them; they were unfortunate in thinking that the amounts we paid the brick mason covered excavation. Perry Hahn was the brick mason, and as far as I know is still alive; I think he quit after doing that work. I think he is in the mining business now, and that he lost money on the work the same as Mr. Malone.

690

Exhibit "50" is a compilation made from tabulations from the records of the company showing the cost to the company for erecting their water gas machines, also gas holders; one column shows those items, another column shows amounts allowed by Mr. Lea, the third column shows the difference whether plus or minus. In all instances when I refer to the amount allowed by Henry I. Lea I refer to what he gives here as the net construction cost. Taking the water gas sets and holders I have shown what the result is of all those items, and allowed the values allowed by Mr. Lea as the net construction cost; taking the records of the company showing the actual cost and grouping them together. Mr. Lea is short in those groups in the amount of $2,977.99 or practically $3,000.00; my pencil notation of the additions is blurred. I think it is $2,977.99; I will check that up later.

Mr. B. C. ADAMS resumed the stand for further examination in chief, and was examined by Mr. Rose, testifying as follows:

I have checked up the reports and accounts of the company for the purpose of ascertaining the cost of the 200,000 cubic foot holder owned by the company at its station and have ascertained the items of cost covering steel work of that holder as carried in the account books of the company, which I have compiled and tabulated which has now been marked plaintiff's exhibit "71"; respecting that item I was not able to find in the archives of the company the contract for the cost data nor the contract for the excavation, I thought

you already had the total cost of the construction of the
691 tank; I did not find the cost of the masonry nor excavation. Only the tank. I found on the books the cost of the steel work, verified that by the records and also by communication with the Stacey Manufacturing Company, from that I found the contract price for the steel work erected on the company's foundation was $12,630.00; I found from the books as actually paid for the various items charged against this contract $12,639.00 which corresponds exactly with the indicated contractor's price shown by the correspondence; the items contained in exhibit "71" are corrrect as shown by the books of the company as far as I know, the entries were not made in my day, I presume they are correct; they are correctly compiled from the books, the compilation is correct. Mr. Lea includes in his estimate of the construction or replacement cost excavation 5,649.7 cubic yards; brick work 191,840 brick; concrete 174 cubic yards; dressed stone 8.9 cubic yards, plastering, back filling and removing dirt, the pit for the tank required considerable excavation, I can't give the size of the excavation from memory, I think the tank is something like 90 or 95 feet in diameter, and perhaps 25 feet deep, I might be off several feet; the tank is a masonry tank of brick with cement plastering; I have not personally undertaken to estimate the quantities, I think there has been a question here whether the tank was cemented, I can testify to that; the tank was emptied at the time we erected the 500,000 cubic foot holder shortly after it was in service for the purpose of repairing the steel work and that tank was cemented all over, I inspected it at the time and my judgment at the time was that it had been a part of the original construction; it was cemented before we erected the new holder, visual inspection at that time showed it to be lined with cement.

692 In the items of expenditure for steel construction I have not included anything for the excavation or the construction of the tank, nor have I included anything the company might have spent at that time on that work because as the records were kept at the time that construction work was done it was their custom to keep an account of that station covering every part of the work. Exhibit "71" includes only the items charged against the contract price of the Stacey Manufacturing Company, and not any extras, the cost of which was borne by the company, painting didn't enter into this account as I remember that item. I would not say that the naked contract price was the entire cost to the company for constructing the steel work; we never have been able to erect a piece of apparatus on the figure submitted by the contractor and get out on that figure, there has always been incidentals. I would not be able to trace the incidentals that belong to this particular contract. Comparing this table with the estimate of Mr. Lea on the naked item of steel construction as I took it from the court reporter was $14,559.60 which exceeds the contractor's price by $1,129.60; from the records I have I would regard that discrepancy as reasonable and explainable, the price made the company at that time might not have been an average price; there might have been some concessions we wouldn't ordi-

narily get; Mr. Lea also may have included some items we didn't include in this account, such as painting which the company would actually experience over and above the contract price; it is usual for the construction company to give a holder of that description one coat of paint, the company does not consider that sufficient to protect the holder and ordinarily paints it at once over the paint the construction company puts on, that was probably an element of the construction cost at the time. At the time this construction
693 was made I wasn't satisfied and couldn't tell that the account books were sufficiently accurate to give assurance that all of the costs actually encountered by the company were actually entered in the account books. I asked the last time if I might correct one or two sheets, I have done that and now want to submit them, I found a clerical error in additions in exhibit "50", and have prepared a new exhibit in all respects like the original substituting the corrected footings. Leave given by Referee to withdraw exhibit "50" and substitute corrected exhibit for exhibit "50".

The difference appears in the column headed difference in the first total shown as $3,659.08 which should be $3,658.88 then correcting that in the line called Mr. Lea's shortage the figures should be changed from $2,977.99 to read $2,977.79.

I have made examination of the books of the company to ascertain the costs incurred by the company in the erection and construction of the Sturdevant Turbo Blower, and have made a tabulation from the Accounts Payable Journal; the items in that tabulation are correct. The contract price of the #8 Sturdevant Blower, purchased 4 years ago was $1,056 f. o. b. factory. The actual construction cost which the company entered with freight and necessary incidentals added totaled $1,336.87, but that price did not include excavation, back filling or foundation. The company actually paid that sum as shown by its books, that being in addition to the excavation, back filling and foundation. I don't know how much the company paid for excavating, back filling and foundation, that was not included in the contract. Mr. Lea's estimate covering that piece of apparatus installed as compared with the cost given by me at $1,336.87, was $1,435.06, Mr. Lea's estimate being $100. in round numbers over the actual cost. Examining Mr. Lea's estimate his item of
694 $1,435.06 includes back filling, removing surplus material and foundation. I can't tell without figuring it out, but on that small foundation work I would think that would use up a considerable portion of that $100.00, it would account for a part of it at least.

Exhibit "72" is a tabulation on the Sturdevant Blower.

I have made an examination of the company's books of account to ascertain the actual expenditures of the company for the blower, for the old water gas machine erected between April and July 1909; under the heading entered for that construction work I found the company's charges for that appliance; I presume the items were correct as shown by the books, that construction was during my management or at least connection with the company. I compiled a tabulation showing the items of cost for that appliance, the company

actually paid the sum embraced within my tabulation; the price paid by the company was reasonable, fair and paid in the open market for the work, as I remember and as shown here.

Exhibit "73" is a tabulation of the cost of the Sturdevant #7 Blower.

The sum expended for the appliance itself including the installation was $225.00, on the next page I show the additional items of cost of the blower, plus freight, fittings, and building material that entered into the construction, also miscellaneous items the total amounting to $463.54. The total exhibit footings of cost is the same as on the first sheet, except a sub-total which shows the cost of the blower delivered at the plant. The second shows the total for the pipe and fittings; the third item shows the building material; the fourth item shows the miscellaneous items; all the elements are shown on the previous sheet. Mr. Lea allows in his estimate for that appliance $272.00 covering installation and the foundation; my figures give the cost of the foundation too. Regarding the
695 discrepancy between the actual cost and Mr. Lea's estimate I have made a comparison here on the basis of deducting our cost of the #7 blower delivered at the plant from Mr. Lea's allowance for the apparatus installed and discovered from the subtraction that Mr. Lea's figures would allow us $32.35 for our foundation and labor in connection with it; as a matter of fact the building material used in connection with the erection of that blower amounted to $105.86; I would not testify, however, that that item covered the items that went into the foundation only, it simply shows that Mr. Lea undoubtedly allowed a fair price for the foundation work. By a fair price I mean it is low enough. From my knowledge of the appliance and the necessary foundation for it I would question whether $32.35 was adequate enough to meet our cost. That would be the only discrepancy.

I have examined the accounts of the company to ascertain what sums the company expended for the new water gas exhauster. That was erected, the account was opened in December 1908 and closed in May 1909. The apparatus was probably erected in the first months of that period but the account kept open to take into it such items as might be added later; it often happens that we open an account of this description, close it out and later items of construction are added to it; if they are added they don't show as a construction item in the special account opened, but in the general construction account. I have made a correct tabulation of the items of cost of that appliance. The company actually paid the prices indicated and carried them as an actual expense on the books of the company. The transaction occurred during my experience with the company. The total cost to the company of that appliance as shown by the special construction account opened at another time was
696 $977.89, and there was a credit for material returned $2.76 leaving the final total $975.13; the appliance was purchased of B. F. Sturdevant & Company and covered a #6 Exhauster and engine which cost $535.00, that price did not include freight; the freight and drayage in addition to the $535.00 was $28.48; as shown

by the company's records the net cost of pipe and fittings was $119.54; the cost of the foundation and the labor connected with setting appliance and miscellaneous items was $291.11, making the total cost of the appliance $975.13. The cost of the engine, blower and labor was $855.59 the appliance was installed during the period of my service; these sums were actually expended by the company for the purchase and installation of that appliance and I think it was the fair and reasonable value; whether that appliance could have been properly procurred and installed for a smaller sum than the company actually paid at the time it was erected is always a possibility, of course; in my judgment I think the price was fair and reasonable and possibly records the cost of what we might expect. The cost of the engine, blower and labor as compared with the sum allowed by Mr. Lea for the same item, Mr. Lea allowed $616.00 for the engine and blower erected, which is considerably lower than our cost for the engine, blower, and labor, and labor of erecting it, but $52.52 more than the actual cost of the blower and engine plus freight charges and drayage. It might be a possibility to install that and pay for the pipe fittings for $52.52, in that neighborhood, I think that would make us scratch to do it. We paid approximately $119.54 alone for the pipe fittings but I imagine Mr. Lea has included some of these fittings in his estimate somewhere else but not as a part of the blower equipment, that is why I made this segregation; Mr. Lea's estimate falls materially below the cost actually experienced by the company.

697 Exhibit "74" the #6 Sturdevant exhauster and blower just testified about offered and received in evidence.

The new blower at the district holder in East Lincoln was purchased and installed during the time I have been manager but not under my direct supervision, under my general supervision in November 1912. I have a record of the actual costs incurred by the company for that appliance, which however, don't include the price paid by the company for the blower, we have had some little discussion about that in addition to the cost of the blower itself; we had costs outside the blower itself as shown here in connection with the installing and fittings; I have a tabulation of these additional advancements and expense actually paid out by the company for that; the tabulation is correct and the items embraced therein were actually paid out on account of the installation and in connection with this holder. The net total the company paid for installation and connection for this appliance was $306.86 which items were reasonably necessary for the proper installation and connection of the appliance, in my opinion the items of cost were the fair and reasonable cost and actually represent sums paid out by the company for that purpose.

On a separate sheet following this tabulation I show the amount charged to the company by Sturdevant & Company for the #5 blower and 25 horse power three phased motor at their factory, the amount of freight paid, from the company's records, also fittings and miscellaneous items showing the net total; then a line showing the cost of the blower, motor and miscellaneous items as above listed, and

what Mr. Lea allowed for the net construction cost of the apparatus erected; the net total construction cost as shown from our
698 account books was $1,121.86; the cost of the blower, motor and miscellaneous items was $979.27 I arrived at that by adding the blower and motor and then miscellaneous items as shown on the third sub-total. Mr. Lea's estimate as compared with the costs actually experienced by the company allows $633.00 as a net construction cost, which is some $223.00 less than the blower and motor plus the freight cost to us; I haven't made a further comparison between our total costs but I think the difference would be something like $488.86 I think from my experience that the total costs paid by the company of $1,121.86 a fair and reasonable amount for this appliance installed with the incidental expenses necessary to be incurred. I think Mr. Lea was under a misapprehension as to the character of that blower and motor, I think he figured on another type.

Exhibit "75" is a tabulation of the New District Holder blower.

I have examined the account books of the company to ascertain the actual cost to the company as shown by the books of the coal washer and scrubber; have made a tabulation of those items. That appliance was purchased June 3rd, 1887. The books of the company show that the company paid for the appliance itself $2,352.15 and two freight items of $165.60 and $13.45 respectively, making the total cost outside of erection $2,531.20, the tabulation correctly reflects the book entries in that respect. Mr. Lea's figures on the washer and scrubber were $2,121.00 making his estimate less than the amount for freight and the apparatus itself by $410.20; in order to compare his estimate with the company's actual cost should be added to the actual expense the — cost of erection of the foundation. That would be a reasonable item for that piece of apparatus.
699 Exhibit "76" is the tabulation of the coal gas washer and scrubber.

I have made an examination of the records of the company to ascertain the cost to the company of the purifying boxes, carriages and station meters, and find they bought three purifying boxes and carriages and a station meter October 1st, 1892, and paid $13,125.00 for that equipment; paid freight on the boxes of $163.56, freight on the meter $27.87 making a total of $13,316.43, and just to see how that would figure out with Mr. Lea's compilation I assumed his figure for the meter in the amount of $3,901.00 and deducted that to find what the net cost of the boxes would be and found that figure to be $9,415.43 giving a cost per box of $3,138.48, four boxes would then cost $12,553.92, which would be an indication of what we would have paid at that time for the four boxes such as we have in use down there now; I can't say that these items cover the boxes we have, but that is the presumption. I found from Mr. Lea's testimony that he allowed for the four boxes, meter seal and carriage $11,800.00 as for that accounting for the entire expenditure of the company in those appliances, I don't know just how he figured that out, I don't know what that covered; I guess that was his net construction cost on those boxes without any foundation, later he made an allowance for the

foundation of $1,288.00 making his net construction cost for those boxes erected with the foundation $13,088.00; I think that figure of Mr. Lea's would be considerably under what our actual figures were on the erection of those boxes; I couldn't discover from the records of the company what it cost as they are now installed, but as far as was given by Mr. Lea that was a little less than the cost of the appliance without the cost of installation.

Exhibit "76½" is a tabulation of the purifying boxes and station meter.

700 I have examined what records the company have to ascertain the cost of the exhauster and connections erected in 1892, and found the company contracted for an exhauster and connections in November, 1892, agreeing to pay the amount of $1,745.44 for those items, and the records show they actually paid out that amount to the Western Gas & Construction Company and for freight, as compared with what Mr. Lea allowed for the net construction cost for that appliance I have assumed that item as it appears on our books covering a #6 Roots exhauster with the engine we have at the plant; Mr. Lea allowed for that #6 Exhauster $791.00, I intended to ask him if he included the engine that went with it; I don't know whether he did or not; I think I asked Mr. Brodnax and he told me that he did include the engine with the exhauster, I didn't verify that. As far as indicated by the records whether the net construction cost estimated by Mr. Lea was greater or less than the costs actually experience- by the company, his price on the 6 foot Root exhauster is considerably under the amount shown on our records as having been paid out for that apparatus and freight only; our records don't show the cost of erection.

I have examined the records of the company to ascertain whether or not there are any records of the purchase of brick to erect the brick buildings assumed to have been erected on block 79 in 1890; I found that the company purchased from J. E. Stockwell, August 9th, 1890, 263,200 brick for $1,947.68 making the cost per thousand $7.40, I think that shows on the old voucher as the unit cost; it indicates the actual price paid for the brick at that time, that is all the significance I give to it.

As to the actual cost incurred by the company in 1890 for 16 inch pipe I found in November 1890 the company purchased 3 cars of 4 inch pipe, 2 cars of 16 inch pipe for which they paid

701 $1,742.87, as I remember I didn't find any data on the vouchers to show the weights of the pipe, I found only the price per ton.

I have examined the books of the company regarding the governor and connections for the 500,000 cubic foot holder constructed four years ago; that erection was under my jurisdiction and general supervision; I am personally acquainted with the reasonable value of the items, I made a tabulation of them and the items therein are correct and correctly reflects the entries on the company's books, in my opinion the prices given to the items are the fair and reasonable value.

Exhibit "77" is a tabulation of the governor and connections.

The construction account headed "Governor and connections for

500,000 cubic foot holder" was a sort of a catch all construction account at the time we erected the big holder, and many items we didn't know where to charge were charged in this account; the items of expense were necessarily incident to the installation of the 500,000 cubic foot holder and governor, including the cost of the governor. I showed in the first part that we had a holder construction account, when I said we didn't know where to charge the items I meant that there were items of pipe and material that were used outside of the holder itself that were contingent upon the erection of the holder that might have been charged there but rather than do that we put them into this catch all account so we would cover the construction account without these incidental items.

This account includes a 12" governor which cost $360.00. A No. 8 Sturdevant Exhauster $450.00 both F. O. B. factory. Various items entered here are the amounts paid to the construction company for apparatus, freight drayage, pipes, valves, fittings and building material and other items totaling $5,519.15.

There was credited on the total amount $251.88 giving the total net amount in that construction account $5,267.27.

These items are absolutely necessarily incident to the installation of the holder itself.

I show what we paid the Reynolds Gas Regulator Company for the governor; the Sturdevant Company for one #8 exhauster; and the 7 by 6 engine and pulley; the total of those items is $1,127.50;

I also show the amount paid the Western Gas & Construction
702 Company for pipe valves and fittings; also show the sub-total there covering the items paid the Western Gas & Construction Company in the amount of $1,532.32; also shows payments made to C. P. Holm account of building work in the amount of $294.38 for one item and another item for $79.71; in addition to that other building items from the records of the company a sub-total amount of $741.88; also listed there freight and drayage from the Company's records, those are part of the items that enter into the total given in the previous tabulation, to indicate the general nature of the expenditures, but the sub-totals don't make the same total to the total amount; this is a mere classification of some of the items to indicate the character of the expenditures and not all of them.

I have made an examination of the accounts of the company to ascertain what costs have actually been incurred by the company for office furniture and fixtures, taking the amount shown on the books since 1901, as of November 30, 1901, and adding each year up to January 1st, 1913, that were charged on our books as an investment covering office furniture and fixtures. I have shown the original charge to construction of $240.00 and items added since that time to the amount of $12,391.21, November 30, 1901, the total charge was $240.00, I was not here then; I regard that as a mere nominal sum for a corporation like this for that item. The additional investments after that in addition to what were charged into that account previously were as follows: For 1902 and 1903 $1,468.57; For 1904, $269.57; For 1905, $305.39; For 1906, $321.50; 1907, $1,064.28; 1908, $526.21; 1909, $249.77; 1910, $408.77; 1911,

$406.49; 1912, $7,133.05. Mr. Lea's estimate based upon a detailed inventory of that class of property of the company was $13,038.69. I have personal knowledge of the occasion for acquiring equipment charged to investment in 1912, or rather January 1, 1913, of $7,-135.05, we moved our office from the old location between 13th and 14th and O street and went into much larger quarters which
703 necessitated additional furniture and fixtures. The office is located at the corner of 14th and O, 1401 I think is the number where we have a public display room, fixtures, lighting fixtures and the lights; as to the size of the office the length of the building is 142 feet, 50 feet wide; on the ground floor of that space we occupy 25 by 142 feet plus about 22 by 77 feet; there is a little store building taken out of that total area about 25 by 65 feet that we don't occupy. All the rest of the ground floor is right on the street. The office opens upon the street but one space we don't use, the space taken out by the elevator and the little space I mentioned before. As to what the fixtures mainly consist of $7,000.00 represents the purchase of electric fixtures for illuminating the main office, for tables, settees, desks and chairs that were necessary for our use in view of the fact that we took a much larger space and re-arranged our entire scheme of office equipment and arrangement. We have a display room for the sale of our appliances and use that room as a sales room for electrical and gas appliances. Describing the office equipment, the sort of fixtures to accommodate numerous clerks and arrangements for cages and stations, we put in the high desks that are necessary in the office for taking care of the customers as they come in to pay their bills, get their bills, or tell us what is wrong with their equipment; we also had to put in all the partitions to divide the office; the heads of the departments have separate offices in that space, appropriately furnished; we have a partition arrangement or counter to separate the clerks who deal with the public from the public that comprises practically the equipment on that floor; we have several other offices on the second floor that we are using, the back part of the second floor with such fixtures as are necessary; also the basement, we put in several partitions in the basement and some desks in the second floor, no chairs or other furniture or lighting fix-
704 tures, the lighting fixtures are supplied by the landlord, but we supply the basement; the sum actually invested was the reasonable and fair value for the equipment; in my opinion that sum was prudently expended in view of both the interest of the company and the public. I think it necessary to carry a sum of approximately $15,000.00 in that item perpetually, I don't see how they can avoid it.

As to my qualifications in business and how long I have followed the vocation of a gas engineer and manager, I entered the employ of the Gas & Electric Company in June 1903; graduated from the University of Wisconsin from the electrical engineering department; in my services in this line I have practiced the vocation of an electrical engineer in a way; my first experience on the electrical business was prior to my graduation in the electrical shops at Madison, where I did a lot of roustabout work scrubbing off the armatures and wiring

the cast iron castings; as another sample I worked for the Colorado Telephone Company in Denver, I think I crawled through all of the dirty holes in the Union Station, connecting up telephones and taking them out, putting in condensers, changing from the common battery to the series system of common battery. After I was graduated I was first employed by the Madison Gas & Electric Company; for the first year and a half my duties were to test electric meters, the meters were brought in for repair from the consumer, it was my duty to put them in shape to be used again; I also tested the meters that came in from the manufacturers to see that they were accurately adjusted and ready for use, while doing that work I also posed as an expert trouble man for the company; if any days trouble came in that the men couldn't take care of they sent me out to help them out on the job from a technical standpoint, I usually found that this meant for me to do the work as well. That was not the only position I held in
705 that company, I left the electric meter department and went to the Gas department, after going into the gas department my first duties were to help Mr. Wilson of the Westinghouse Machine Company test out some gas engines, and as a representative of the company I had to see that the tests were accurately made so that the company wouldn't get the worst of it; there was some dispute between the Company and the Westinghouse Company as to the value of the engines and as to whether or not they had met the guarantees of the manufacturers; after I got through with that work I was detailed to look after some coal gas operations at the gas works to discover why the company wasn't getting better results from the coal carbonizing; also helped the old man around the works pump tar, and various kinds of work that a graduate usually has to do to get into touch with the practical line; then I left the department and went into the office as superintendent of distribution and was there for some time, over a year, and had charge of both gas and electric departments in the distribution system; in July 1906 I came to Lincoln as general superintendent; was superintendent of both gas and electric plants at the time I came here; served in that capacity from July 1906 to some time after July 1st, 1909, and have been continuously in the employ of the company since; I have been general manager here since 1909 but have done some other work besides that for this company; have examined several properties for Henry L. Doherty & Company where I was directed to make an investigation to discover whether they wanted to make a purchase; have also done some independent work for various people in an engineering way; am familiar with all the departments of the Lincoln Company; since graduation have taken part in conferences of engineers, read engineering journals. We do not have regular meetings hardly but occasional meetings of the managers that operate in consultation with Henry L. Doherty & Company; I attend those meetings, in which
706 all the engineering problems in these utilities are gone over to a large extent; the purpose of these meetings is to discover improvements and modern methods of operation to make improvements in our operation; have endeavored to keep up with the improvements and modern methods and keep myself advised of

any new schemes that seem practicable; consult universally with Henry L. Doherty & Company in matters of engineering problems that arise in this company, and regard that as good practice; I don't think anyone operating a property of this size, or any size, should take it upon themselves to give the last word in all the undertakings necessary to develope the property, it wouldn't be fair; it is customary when troubles are developed and schemes for meeting them to submit it to Mr. Doherty and the Doherty Company; Mr. Doherty acts as a consulting engineer for this company, and their own properties; at all times I have the advice and benefit of that engineering company and avail myself of it absolutely; no independent fees are paid for engineering services to the Doherty Company; comparatively recently for example in financing this company regarding the $500,000 issue of the company's three year notes the Henry L. Doherty Company was absolutely responsible for the sale of those notes, the only connection we had with it here locally, was to show the auditor of the A. B. Leach & Company through our works and give him access to our books so he could get the data; no separate fee was paid Mr. Doherty or his company for disposing of the $500,000 of notes; I regard those services of considerable value; it would have been impossible for us to finance, under our condition, without the aid of Doherty & Company or someone that had the same interest they had; under ordinary conditions it is customary to pay a considerable per cent for the services of a banking house to float and sell securities of a company like this; I think Mr. Doherty is the only one who has gotten away from the old idea of going to the bankers and saying we have this issue to sell and we will give you so much to sell them.

707 When we have a situation requiring the raising of any amount of funds we do it through the New York Executive Offices instead of locally, anything out of the ordinary such as bank loans, the Executive Office-s get no fee for that service; Mr. Doherty and Mr. Freauff are paid for this service through the nominal salary they receive; Mr. Doherty get- $3,000.00 a year and Mr. F. W. Freauff gets $2,400.00 a year. From my experience in this utility I have always thought and still think these compensations are reasonable, and are prudently and necessarily paid. These are really nominal amounts from my understanding of what is ordinarily paid officers in that capacity for their services as executive officers of the company as compared with the advantages the company receives. Those salaries really cover the services rendered by Doherty & Company in a general way, including their services as consulting engineers and financiers, as I understand it it is a partnership and the salaries go right into the company, and we derive the advantage of the services of that company; in addition the firm of Doherty and Company maintains a school for the education of young men suitable to promote business for such company-'s as this; they study the most efficient and advanced systems for the development and promotion of business; in consideration of the payment of these salaries we are permitted to call upon Doherty & Company in the promotion

of business for assistance, and have done it; those advantages are very useful.

I am acquainted with the pay-rolls of the various departments of the company in a general way; as heads of departments we have a secretary and Treasurer, Mr. R. E. Phillips; Mr. George A. Montgomery, general superintendent; Mr. J. E. Shuff, new business manager; I have covered the superintendents, those are the three general heads and the sub-heads under them; this company itself has been somewhat of a school, our secretary has grown up in our business,
Mr. Montgomery has not, he is a McGill graduate and had
708 *and had* other experience before coming here. Mr. Shuff was
a creation of this company as new business man; we pay Mr. Phillips $150. a month, I guess I am responsible for that myself; we pay Mr. Montgomery $200. a month and Mr. J. S. Shuff $175. a month; our superintendent of distribution is Mr. Baxter, he is under Mr. Montgomery as superintendent; he pays Mr. Baxter $90. a month I think; we also have a purchasing department or purchasing agent, a new department we put in last year; it hardly justifies the name of a department, we pay the purchasing agent $100. a month, I think he has more than saved his own salary in making economical purchases and in seeing that we get our discounts and in checking over our stock; I am acquainted with the efficiency of each of these gentlemen; from my knowledge of the responsibilities and fitness for the places they fill I would say in my judgment the compensation paid them was reasonable and prudent and what we would expect to pay anyone for that work. I think their employment adds to the efficiency and to an economic administration of the business; I am familiar with the pay-rolls of other laborers including bookkeepers and men at the stations and in all departments of labor; I supervise these pay-rolls in a general way; as to the rule adopted in fixing the wages of such employes, common labor is determined by the demand for labor and the amount paid for men who have charge of the work is determined by their experience and men available for that sort of work, we pay the ruling prices in this market for labor, at time- we have paid more than that, we have discovered in a good many instances the men would rather work for someone else, perhaps the city, than for us, because they are handled a little more
leniently and our work is a little more disagreeable, for street
709 work it is difficult to get the labor. We sometimes, but not
always, are required to pay them slightly higher, such as money or transportation to and from work, perhaps cutting down the number of *house* or making some concessions. I regard our pay-roll as reasonable, and act upon my best judgment and that of the heads of the departments; those matters are under my entire control locally, we get those things through conferences among the department heads and adopt the course which we think tends for economical operation of the plant. As totals these wages are all reflected in the monthly and annual reports of the company identified here, they were identified by Mr. Phillips. The office of purchasing agent was established just a year ago; in a way the secretary the general superintendent and sometimes myself had charge of the purchases we sort

of spread it around in the different departments, but all done under my supervision and is yet even with the purchasing agent.

In my experience with the company the prices paid for materials and supplies of all kinds necessary in the gas making business have been the best we can obtain in a fair market, and have been uniformly so since I have been connected with the company. By the employment of a purchasing agent the object was to increase our economics in the matter of purchasing supplies and materials and to relieve those who had been handling that work, we were crowding our secretary too hard with the details; we could turn the purchase of coal over to a man on the ground constantly, and could get better prices in our electric department; that would be reflected in our gas department because steam is one of the essentials in the manufacture of commercial gas; the market has changed in the last year very materially from the market we used to buy in; there was a time when it was easy to buy coal at a very low price, and pick up gas
710 oil either in the open market or through contract, it has been almost impossible to buy coal or oil in the last year readily without considerable difficulty in getting it shipped at the proper time. I regard it necessary to have a man who devotes his whole time to that which reflects in the economic saving. I became familiar with the distribution system from the time I was superintendent. Before we reach the distribution system I supervised the purchase of materials and in a general way am familiar with the cost of materials and supplies. Coke and oil are the two principal ingredients that enter into the manufacture of gas, we also use steam, the office of steam is to pass through a bed of hot coke which is decomposed into hydrogen and oxygen, the oxygen united with the carbon in the coke and makes a blue gas, or coke gas that has no element of power and a relatively low heating value, that gas is passed on into the carburetter where it is enriched with oil, so that steam is just as essential as oil or coke but does not enter into the expense in such large proportions as the other two.

In connection with the manufacture of gas for 1912 I would explain the increase in the cost of manufacture has been very largely due to the increase in the prices we have had to pay for gas oil, the extensive use of gasoline for automobiles and other purposes has increased the cost; the refineries have been making all the gasoline possible taking out of the market some of the gas oil; for a considerable time we have not been able to buy oil on a flat rate, our contract now provides for a sliding scale, if the market price for crude oil goes up our price goes up, if it goes down our price goes down, some plants over the state have asked us if they could get gas oil from us if the oil companies should shut them off. We don't have a price for gas oil under the sliding scale for the entire year;
711 I can't remember the details and prices for those contracts; I think one contract was based on 68 cents a barrel for crude oil, and 1/40 of a cent to be added or deducted for each rise or fall of one cent per barrel in the market price of crude oil, to be familiar with them I would have to look at those contracts. I couldn't tell what the per cent of increase of gas oil was in 1912 over 1911, I

don't know what the average price was for the year, in 1911 we bought for 2 cents a gallon, in 1912 it run up as high as 4.2 cents, it never got as low as 2.7 cents; there never has been a reduction on account of the sliding scale arrangement in the contract, it has always been an increase.

I remember upon the original hearing that Mr. Beemis the statistician and *certique* of the city suggested there might be some economics of operation derived from going exclusively to the water gas system; after that hearing we went to the water gas system, that was about the cheapest advice we ever had. To a certain extent we have always felt that our coal gas plant enabled us to accomplish the consummation of an oil contract to much better advantage than if we didn't have the coal gas plant. The manager of one of the gas plants in Nebraska abandoned his coal gas plant some years ago, tore it down and threw it away and put in water gas, he is the man who called me up and asked if I could help him out with gas oil if the oil companies shut him off. Where we could not absolutely make water gas and would have to fall back upon the coal gas operation it is not at all improbable that the price of gas oil may advance under the conditions to a point that would commercially prohibit its use in the manufacture of gas. We cannot consider that the cost of manufacturing water gas is stable at the present time so that we could figure what would be the cost of material, and I think it the reason-
712 able and logical thing in view of those facts to keep equipment in the plant of a coal gas apparatus; our consulting engineers advise us to keep our coal gas equipment in shape to make coal gas if occasion should require. In my opinion I would not say that when the prevailing price of coal oil ranges above 4 cents a gallon that I would regard it economical under those prices to operate the coal gas plant, I am not prepared to say that; there is a point where it would be more economical to substitute coal gas for water gas, I haven't figured out precisely the point where you would want to switch to coal gas. I regard the conditions absolutely prudent if not necessary to maintain a coal gas equipment in the plant. We buy our coke now in the market, if we had coal gas machines of course we could provide our own coke.

Coming to the distribution system for some time including July 1908 I have been familiar with the conditions of the pressure in East Lincoln which gave the management trouble, we couldn't get the pressure that would satisfy the consumers in East Lincoln for some years, and the district holder was located at 32nd and X for the purpose of giving our consumers in that territory service and to aid us in giving the consumers in South Lincoln and other parts of the city better service; I made a particular study of the gas distributing plant early in 1908 because of the conditions we experienced there; we made an effort to doscover just what we could do at that time to enable us to give consumers getting a low pressure a better pressure; made a detailed study of the entire system at the time to find the most economical thing to do as a temporary make-shift. We had no direct trunk leading to Northeast Lincoln but I would say that

all the pipes in our system may be North of L street carried
713 the gas out. We had some mains, distributing trunks that run out O street to 18th, on 18th to R, on R to 27th and down 27th carried the principal part of the gas out there; the main at the plant was a 20 inch main that we still have in service, then came the 16 inch, 12, 8, 6 and 4 inch; on M street at 18th I think we had a 6 inch main; I think the main out R street was 6 inch extending to 27th; I think there are some 6 inch mains beyond 27th and R extending down 27th, either 6 or 4 inch, probably down to Vine street, I don't remember just how far. The most remote point in that direction from the station holder might have been Holdrege street, I don't remember, some 6 inch main ran East of 27th street out R I don't know how far. We did not find the source of supply adequate to give pressure in the service mains that were connected with the 6 inch mains.

The mains that led from the station holder to Southeast Lincoln were taken off from M street; at 9th I think was a 10 inch main that run South. Giving the comparative sizes of the mains that run into Northeast Lincoln with those running into Southeast Lincoln and how the comparative pressures in those services were reflected would say there is a 12 inch main going off from M street feeder at 9th street, that runs out to G then over to 10th out 10th to C, then a 10 inch main runs across C to 18th, a 10 inch main runs baco to O street at 18th that is also continued through to R street, a 6 inch main runs out R to 27th connecting into the 4 inch main that runs to Holdrege, and a 4 inch main runs up R street a block; we also had some 4 inch main on T street and a little on U street I guess that is; this system was originally designed for the purpose of taking care of the large growth in the South and Southeast portion, and be-
cause the Rock Island Railroad ran through the town and
714 kept cars at the depot on O street we thought there never would be any material growth out in Northeast Lincoln, consequently no plans were adopted to take care of the growth we have had since 1904 and 1905 out there. At the time we made a study of the pressures in the different portions of the city to discover what to do to relieve the people in Northeast Lincoln, we had short interval readings taken of pressures in different parts of the city for the purpose of getting the comparative pressures between the Northeast and Southeast districts; in one instance we took the plant pressure; at 7th and M the pressure; 9th and M, 11th and M; 18th and R every five minutes from 5:45 to 6:15 in the afternoon, which was the time of the heaviest demand on the system; those pressures were measured in inches of water and are tabulated here, that tabulation shows when we were getting the least pressure at 18th and R during the time the readings were being taken. We got 8.5 inches at the plant, 7.6 at 7th and M; 7.4 at 9th and M; 5.9 at 11th and M; that was for Tuesday November 12, 1907, 18th and R 3.4; Tuesday November 19th, a week later we took a similar series of readings and with 10 inches at the plant we got 3.8 inches at 18th and R at 6 o'clock; 6 inches at 18th and M; 6.5 at 14th and M; 7.5 at 11th and M; 8.8 at 9th and M; these charts were really for the purpose of studying the drop in

pressure along the feeder as it went out into that Northeast district, then we took individual tests taken in the territory, there were two more charts I am not reading them all; I will explain the charts showing how the pressure fell at the points tested in the Northeast District; November 12, 1907, at 2141 "A" street we found the lowest pressure we got there it was about 1.8 inches, the plant pressure that same day as shown on the following chart was 13. November 14th, 1907, at 3031 "R" street shows the lowest pressure of that date to have been at 6 o'clock .8 of an inch, that is in Northeast Lin-
715 coln; with an .8 inch pressure it is absolutely impossible to give an adequate and sufferable or permissible service at the jet or anywhere in the house; engineers have usually looked upon 1.5 pressure at the meter as a sufficient pressure, but my experience is that isn't enough and the gas is ordinarily burned at an inefficient pressure where that pressure is received at the meter; an .8 inch pressure as at 30th and R is a very expensive pressure for a consumer and causes complaint, dissatisfaction and high bills, and dangerous to heaters, when the pressure gets to .8 inch it is getting so low the gas might go out entirely and when the pressure comes up again the gas escapes unknown to the inhabitants and death may result.

Now going into particular detail these charts show when we are getting a reasonable and satisfactory pressure in South Lincoln you are getting a very unsatisfactory pressure in Northeast Lincoln; the valves we had in our system at that time we were able to shut down those valves taking the overflow of gas to South Lincoln and divert it to Northeast Lincoln, we made an effort to do that and even then we were not able to give the people in Northeast Lincoln the service they should have; that device was resorted to at the risk of good service in Southeast Lincoln, we cut them down to just the minimum pressure in Southeast Lincoln in order to give the Northeast Lincoln people minimum pressure at that time. We adopted the notion of putting in a temporary booster at 9th and M to take the gas from the main at a pressure of about 6.4 inches and boosting it to a pressure of 14.1 inches forcing that at 9th and M to 18th and R through the main feeder to that Northeast District, shutting the valves going South so it wouldn't get into the South part of town under
716 high pressure; that was our recommendation to New York as a temporary make-shift to avoid the expenditure of $10,000 to $12,000 in improvements at that time which would only give temporary relief and some other scheme would have to be provided later. We were unfortunate in buying our blower for which we dug a pit at 9th and M and got the blower in there only to find that the manufacturer had sent a seive instead of a blower and we were unable to use it, we had a hard time that winter doing anything for the people in that part of town. The next year we took up with Doherty & Company the matter of what we ought to do to take care of that district, then we finally adopted the district holder scheme; I talked with Mr. Scott the general manager of the Doherty Operating Company who suggested they had used a district holder in Denver, and when Mr. Bradford and I got to working out the situation in Northeast Lincoln we finally recommended a district holder to Mr. Scott

and he heartily approved it; it was really Mr. Scott's ini-atory suggestion or idea and our solution of that came from the consulting engineer. Whether there was any other purpose in suggesting the district holder except to relieve the conditions out there, you might get at that in this way: Before Mr. Bradford and I made our recommendations we went carefully over other schemes for getting at the situation; we went at two other schemes, one was to run a high pressure main out to the Northeast district; the other to segg*r*egate and connect up a district governor and put in a bigger feeder from the plant, or some other part of the system, we abandoned both of these schemes as not practical under the Lincoln conditions because the City Council was constantly agitating the company in regard to their high pressure and the delivery to the mains and threatening us with law suits, and the Water Commissioner reported every
717 month that the pressure exceeded the limit required by ordinance; Mr. Bradford and myself thought it absolutely impracticable if not impossible under our situation to talk about any other scheme than a district holder for relieving that situation. We still face that situation, the Water Commissioner's reports, and the State Journal has taken upon itself to advertise that fact freely, and as we thought, even maliciously. Even though the engineering features of transmitting gas out there some other way might be feasible and deserve consideration, we didn't think we ought to consider it.

The problem encountered in selecting a particular location resolved itself into this; What pressure could we deliver from our plant and how far could we carry it into Northeast Lincoln with what I would call a low pressure system; I regard as a low pressure system any that delivers gas with a centrifical blower; when you get a positive blower you get into high pressure; we wanted to stay with a low pressure system, one that you could throw gas into Northeast Lincoln and give the service at the furtherest point, then we thought the safest and best thing to do was to get a district holder as far out as we could to bring the gas back. We considered that Lincoln would eventually grow East of 33rd and South, and that the district would grow up around from 27th to 33rd and Holdrege and further North and West and if we could get our holder around 33rd and the Missouri Pacific, or somewhere along there we would have the holder properly located; we figured that the ordinary pressure of the holder and through it would bring the gas back into Lincoln and overlap with the gas that was coming from the plant holder; that the pressure from the plant holder and the district holder would meet at a point where we could realize the pressure midway between them, and also in a good
718 holder so far out we could get gas into it during the hours of light load, we might put the holder out so far that the gas would feed into it during the hours of light load on account of the drop in pressure and in our actual experience we have absolutely found that that particular location has met the problems that faced us; I regard the location of that holder unavoidable in view of the conditions existing in Lincoln at that time; it was put there to meet those conditions; without doing something else we could not give the

service in Northeast Lincoln at the present time without the holder; I made the expenditures for the company for that holder; I negotiated the purchase of the land for a site; negotiated with the City for the right to erect and maintain the holder at that point; I regard the purchase of Lots 1 to 15 in Block 2, and lots 1 to 15 in Block 7 a necessary purchase in order to carry out that engineering plan; difficulties were encountered in carrying out the plan from the municipality and property owners eventually necessitating all of that property in Blocks 2 and 7; after our estimates were all made for the erection of that holder we discovered that the City Council was going to offer objections to its erection without a permit, we appeared before the Council and asked a permit even though we were advised it might not be necessary; the Council appointed a committee to take it up with the company; we had our price on a holder with a steel tank and the Council Committee insisted on our digging a pit at a very considerable more expense than the steel tank; it was also intimated to me personally by the Committee that unless we were able to satisfy Mr. Hill, who owned a house and some lots adjacent to the holder, that perhaps we might have some difficulty in getting a permit; at that time Mr. Hill was the Janitor at the High School and rather than have any difficulty over the matter we paid Mr. Hill his
719 price for the property and the permit was later granted. I regard that expenditure as reasonably necessary, we had to do it under the conditions to maintain our right to locate there, it was perhaps a matter of expediency rather than duress, but we did not get the permit until after we had agreed to do that; we got the permit after we had purchased the property. I don't connect the two transactions together exactly but I would not pay Mr. Hill for his property until after we completed the erection of the holder, because I figured something might turn up to prevent its final completion, that either the City or some property owner would enjoin us. Mr. Armstrong at that time was president of the company and he and I agreed to take that property up near the holder when the holder was finally put into service and it was not until after that agreement was signed that we were able to start work, and we in that way avoided an action for damages which otherwise we would have anticipated from Mr. Hill; in my opinion, as I regarded his position and claim that his property would be damaged would be sufficiently influential with the City Council so they would withhold the permit until he was satisfied. It was not the suggestion of the Council that we buy his property to satisfy him, they didn't act on it in that way; the committee had two or three conferences in the office, well before we finally concluded it they appointed two committees, adjourned one and appointed another, the first committee wouldn't act at all, that committee as a committee I don't believe ever said we must buy that property, but individual members of the committee intimated to me personally there would be considerable trouble about erecting the holder unless Mr. Hill was satisfied and would say to them he
720 wasn't going to cause any difficulty; I was finally able to agree with Mr. Hill and got him to go to that committee and say I am satisfied. Was not able to satisfy him except by purchasing the

whole property; I tried to get around that in some way but have forgotten how now. Other suggestions as to improvements of the property were made by the Council Committee, the Council Committee went to Mr. Dobson the City Engineer and asked him to look over our plans, Mr. Dobson then indicated the size of the mains we were to run from our holder; under the agitation caused by that Council Committee, the Committee was afraid we were going to raise our plant pressure to fill that holder and work a hardship on the consumers; I argued that we were putting governors on all consumers premises, no matter what we did with the pressure at the plant it wouldn't affect the consumers, we insisted that something must be done and he insisted on our putting in large mains around that holder leading back to the outlying district, and set out what we were to do, and Mayor Love said before we could get his approval it would be much more satisfactory if we would park that place and plant trees and shrubbery and fix it up; we had Fred Yule figure a scheme for us and we presented it and he approved the permit. There isn't anything out there in the hot summer, still we were under a moral obligation to plant it and we did it. We still have our promise out to carry out the parking scheme and beautify the holder and we are going to do that, we have plowed up block 7 and have planted grass seed and are going to tell all the kids in the neighborhood to play ball on it. We erected a 6 inch main from the holder to meet the 6 inch main from the plant as required. Regarding the additional cost experience because of the requirements of the City Council, before there was any publicity given to it we were able to buy
721 lots 7 to 15 inclusive for $1,000.00 that was done in a way that we didn't indicate to anyone that we were interested, as soon as it was discovered that we were interested the proces went up around there; we paid Hill for his house and six lots $3,500.00, the house had no basement to speak of, a little hole in the back part, no water, gas or electric fixtures, it wasn't a modern house and we didn't want it. When we finally got the holder up Mr. Sinclair said he noticed a horrible odor of gas, that his property was being damaged and either we were going to buy it or he was going to sue, I bought the property in recognition of his claim for liability; Mr. Kimball owned the next property, lots 1 to 6 adjacent to that, he had learned that Sinclair had sold his property and he felt that he also smelled some gas and I bought that property, for $1,750.00 making a total for the 15 lots I believe of $3,350.00; of course we didn't live there and the trees hadn't been killed, I went out there and I couldn't smell the offensive odor of gas, but there would have been a bona fide controversy with both of those parties for damages, and we might have to pay the whole price of the damages as a part of the cost of the holder anyhow; I figured these purchases as a settlement of these damages claimed for this property.

These points on these charts indicate the points on that day which they were taken.

We produce the pressure charts for inspection of counsel for the City, they cane be introduced in evidence if necessary but if not necessary we will not introduce them.

In connection with the preparation of the engineering scheme to relieve the condition in Northeast Lincoln, a report was compiled under my direction by S. W. Cheney, who was superintendent
722 of distribution at the time, who made a report and sent it to the Doherty Operating Company, which explains the conditions I encountered at that time; it embodies the conditions of the booster proposition; it was compiled as an operating condition, a part of the Res Gesta of the transaction as it were.

Exhibit "78" shows the time we erected the East Lincoln Holder.

Exhibits "31" to "51" inclusive, and "71" to "77" inclusive offered and received in evidence without objection.

In my judgment as an engineer the district holder was the most satisfactory and economical solution of the variable pressures at the services which we encountered and desired to correct.

As a general proposition the placing of the district holder would not be attended with as much difficulty and inconvenience to the public to afford a remedy for those troubles as to tear up the mains. In the plan we adopted and finally executed in view of the advice from our consulting engineers and our own investigation we employed our own best judgment to serve the people and increase the efficiency and economies of operation of the plant.

The use of service governors in this city is almost universal, the practice is never to put in a new service no matter where it is locate without putting in a governor, my recollection is we have somewhere from 7,000 to 7,500 in use. We are practically operating now on a system of service governors, in my judgment I think it is one of the best things we ever did, it satisfies us, and the customer is more satisfied whether he thinks so or not; it reduces our complaints; in some instances a consumer wouldn't have a governor installed owing to some prejudice that wasn't justified, as a general proposition I
723 think the community is well pleased. By putting on the governors and through the increased pressure through the district holder we have practically eliminated the trouble due to variable service.

Cross-examination by Mr. Morning:

The item of office furniture is carried on our books and inventoried at $12,391.21; in 1901 it wouldn't be the same item, the same heading is carried at $240.00; in other words November 30, 1901, our office furniture was entered on our books at a valuation of $240.00 whereas now it is $12,391.21; as to what there is in connection with the operation of a gas plant in this city since 1901 requiring such an increase, in the first place you would have to assume that was all the investment they have, which I wouldn't think was proper for furniture and fixtures, the occasion for the increase has been the rapid developement of the business during the years that have elapsed, and the better policy for handling consumers and give them conveniences as we look upon that. I don't know where our office was in 1901, I wasn't here in those early years but have been told their office was

in the basement of the Burr Block and also in the basement of the Farmers & Merchants building, at one time J. K. Honeywell and Jake Oppenheimer did all the work for the company, that was before our company took this over. I think in 1900 this company engaged in the manufacture and sale of electricity, that commodity has competition in Lincoln, and quite a considerable portion of the activities of the company in pushing business, displaying fixtures and such articles as are displayed in our present sales-room are in connection with the electric business. I would not say whether the electric business dated back to 1892, I am not very familiar with
724 those dates. The Traction Company I don't know when the Traction Company engaged in the sale of electricity for commercial purposes. I don't assume that we have not competition in the manufacture of gas, or that we have an elaborate office, we pay $450 for rent of our offices a month, but we look upon the handling of the public as one of the most important items of our business, a very, very important element is to be able to take care of them systematically and quickly, we took that element into consideration when picking out a location and arranging our offices as now, we feel that the community is glad to see us adopt the most progressive and advanced ideas in equipping an office and arranging to take care of the public; in arriving at the cost to fix that office up we made every effort to keep the cost down and still maintain the proper equipment, location and arrangement and our experience has been that our policy there was correct because we have reduced absolutely the number of so-called complaints and kicks from the consuming public. If we had been able to get offices for $75 a month that we felt would satisfy the public we would be awful *gald* to do it. I don't know anything about a suitable location on a side street, 11th street for instance, adequate to accommodate the public, I made some investigation as to what we could rent a building down on South 11th street for, my conclusion was the rent was too high for the location and the building we could get. I don't know what the N. S. Cafe in the Brownell Block pays at the present time, but I imagine they pay less than the same space was offered to us for. I don't know that they pay $100 a month; that location is a little over half a block South of O street on the West side of 11th not far from the business center in this city; as to location assuming that we could get all modern conveniences that we have in our present location:
725 if we got the same space and same conveniences we still considered that location was not in the direction of the growth of the city and that we ought to follow that general direction of growth, we felt that the growth was in a Southeast direction. I can't seg*g*regate into floor space what portion of our office room is occupied by the gas business; the entire space is used for the transaction of our gas and electric business the space used for display purposes is about 25 by 65 or 70 feet; I don't remember what the total floor space for the whole office is; I would not say that 50% of the floor space was occupied by our display room; we have 25 feet on O street by about 70 feet in depth which is absolutely the most desirable portion; the principal portion of our offices are to the rear

of the building, and the balance of the floor not occupied by the office is occupied by such gas and electrical appliances as we offer for sale; in the basement we have a little store room, an electric motor and gas shop, a various miscellaneous character of supplies, stoves, fittings, and small fittings; we don't handle fixtures any more for gas fixtures; we have burners, but no electric fixtures; we have electric appliances such as flat irons, curling irons, percolators and all electrical appliances made for commercial use, all kept in the basement of the building. I think the general public is interested in our selling gas stoves and electrical appliances; practically all hardware stores sell gas stoves and ranges such as we sell and we are glad to have them do it, we are in direct competition with them and the community can buy them in the market from any of the dealers and the same is true of electrical fixtures; all those things we display in this room are articles offered for sale by dealers but not at our prices;

726 we use not an expensive office but our office is for the purpose of displaying articles that come in direct competition with similar articles offered by other dealers in the city; whether we make a profit on electrical appliances depends on how you consider it, what you consider a profit and what you figure from; I think taking account of the appliances themselves, their bare cost plus freight and storage and sales prices we always try to get a figure that will let us out on the — sometimes we make some profit; we don't try to make much on the profit, that is true of gas appliances. We would like to sell them at a profit and we do make some profit, and if we could make enough sales we probably would get out clean, but with our effort to sell the appliances, if we were to put the prices on them that would let us out on the total expenses we can't make the sales; and as we have been vitally interested in building up the business we feel that we can handle and sell at a lower figure than any dealer could; no dealer would make the same investment in fixtures and at the same time make the same effort to sell as we would, he couldn't sell as low as we could. We carry a fairly large stock of stoves and comparatively small stock of other items. I don't remember what our books show during the last year whether handling these appliances for gas and electricity have netted us a profit or not; as we figure I think those items show a loss, justifying that it is a necessary incident to the main business on the ground that it is necessary to develope a market and make a larger business. That is not especially true in the electri- business where we have competition. Where the price is not made by legislation but by competition it requires this outlay and to devote our energies in displaying goods and encouraging consumption for a market, but no more so than the gas department, in fact a large part of our store room and display space

727 is taken up and used for the sale of gas appliances. Our monthly and annual reports for the year ending December 31, 1912, show the loss, if any, sustained in handling and selling gas appliances; I don't remember, but could tell by looking at the report ending December 31, 1912, whether there was a total loss on gas appliances alone of $7,301.93 or thereabouts. I recognize from this copy of the report handed me totals for "Advertising and newspaper

space, exhibition, salaries, wages and miscellaneous expenses," and then adding the cost of appliances sold to the appliance expense, from that getting the total cost of the appliances, then deducting the amount received for the appliances, I find for the year represented on this sheet $7,301.93, a loss reflected in the operating expenses of the company for that year. I don't think a large portion of this $480 per month rent is made necessary to carry these appliances and display them for sale. If we eliminated the appliance business and electric business I don't think we could take care of the consumers as we do now and give the satisfaction and develope the business as we are doing it. I could not take out the $7,301.93 loss that year nor reduce the price of gas by that amount and increase the sale of gas if we didn't handle those appliances because certain elements enter in there anyway whether we handled the appliances or not: as shown there that loss of $7,301.93 includes several items that are outside of the physical sale of the appliances themselves. I justify the carrying of the appliances and selling at such a loss as sustained last year as a necessary and wise thing to do to promote the sale of gas. I could not take out that entire amount of $7,301.93 and justify it by a reduction in the price of gas to the consumers; I think this item loss on appliances includes office rent in exhibition ex-
728 penses, I can't tell you the proportion, Mr. Phillips has figured that out; I wouldn't be prepared to say how much enters at all at this time, but I think it is in that item. I would not say it would be neccessary to be on a prominent corner, maintain elaborate offices at a rental of $450 per month to economically carry on the manufacture and sale of gas in this city, but I think it is necessary to maintain an office on the best business street in town, as economical location as we can get, considering the growth of the town, the demands made upon us by the public and our obligation to take care of them. I would be glad to explain how we can better take care of the public at 14th and O street than on a side street such as South 11th, 12th, or 13th, and put it on this ground: A large per cent of the bills paid at our office are paid by women, it is our duty to get as near the center of the town as we can, taking into consideration how these people come into the business district, and how they get out of it; our observation has led us to believe that 13th and O is as near the center, that quite a good many more women get off and back on the cars at that point than any other; that is a point where cars can be caught going into South, Northeast and almost every other part of town; many customers have tols us they are gald to be able to get to our office from that corner by only going a block, we always felt if we got out of the central part of town we would be criticized for it; I think 80% to 90% of the bills are paid by individuals coming to the office, the balance are paid by check and through the bank: I don't remember what proportion is paid our collector, that all shows in that report, I can't tell you; here is one instance we received at the office 12.2%, Teller 3½%, collector 6%; the percent paid
729 at the office for December 1912 was 76.7%. I know where the Court House is located, it is nothing like as near the center of the town as our office. I know where the City Hall is between

9th and 10th on the North side of O street, but people go there to pay their taxes and water bills four times a year, to the Court House once a year and to our office every month; I don't think it just as convenient for the majority of these consumers to go to South 11th or 12th, it is not as accessible to street cars from any point as our present location. South 11th street within a block of O street is nowhere as near the center of the shopping district as our office; Were our offices located on N street anywhere from 10th to 14th I don't think it would be as accessible or convenient as our present location, it wouldn't take over a block of walking but otherwise they would have to go out of their way to get there. Everybody has to walk 2 or 3 blocks out of their way for shopping if in the neighborhood of 11th or 12th and O, but a great many people go to the Library and we are in the same block; a great many people go to the Orpheum which is up another block, a great deal of traffic comes into our office that is incident to other things. I don't know that we could save considerable on rent if we had our offices on N or South 11th, or 12th, or 13th between N and O or South 11th between O and M. I know that rents are many times higher on O street than on side streets because property is much more desirable for any business. We have the only gas property here so far. I absolutely think we sell more gas to this community by having an office paying $450 a month for it than if we had our office on South 11th or 12th street and paid $100 for it; sufficient to overcome the difference in our operating expenses, I think it is absolutely justified on that basis, and on the general ground that it is our duty to take care
730 of the public as conveniently as we can take care of them.

The large department stores in Lincoln are Rudge & Guenzel's, Miller & Paine's, Herpolsheimer's, and others,—well hardly department stores in that same sense, there is Hardy's, and Robertson's up there by our office and Benway's down on the street a ways. Miller & Paine's is the largest of the three department stores I mentioned, they are on 13th and O; Herpolsheimer's 2 blocks West and 1 South at 12th and N; then the two largest and prominent clothing stores are Armstrong's and Mayer Brothers; Armstrong's is between 12th and 13th on O a block and a quarter from our office: Mayer Brother's store is near the First National Bank between 10th and 11th on O, nearly four blocks West of our place; The Post Office is West over four blocks away; the Post Office is frequented by citizens, but it has several branch offices, one South, one Northeast; and when you consider the Post Office location we are about in the center of the three locations. I doubt if we had an office on South 11th from O to N or N street from 11th to 14th that it would be as convenient to the public or as adequate or reasonably satisfactory; the town is growing to the South, East, and North, and absolutely no way for it to grow West, it is headed off there by the Burlington tracks, the Viaduct, and the University is on the Northwest, it is all growing in the other direction; our experience has been that the business district is following after the growth of the residence section and we had that in mind in trying to take care of the growth of the town with reference to our present location.

Referring to our salary account, Mr. Montgomery has a salary of $200 a month as general superintendent, Mr. Phillips as secretary and treasurer, $150 a month; Mr. Shuff has the contracts with the customers and new business department, getting new business and taking care of what we have. If a man wanted a new gas
731 business installed that very often would be done by Mr. Shuff. he is responsible for getting the new services. I get $300 a month as vice president and general manager. The office of purchasing agent was created about a year ago, his function is to pass on the requisitions for materials, does the purchasing, to a large extent, and is responsible for the store room and all of our appliances kept in stock. He buys coal and oil for the electric plant, looks after the coke and oil shipments for the gas plant, in fact all the requisitions for material or apparatus goes through Mr. Malette, he purchases gas pipe. Concerning the function of Doherty & Company about which Mr. Freauff testified, Mr. Doherty closed several blanket contracts for appliances, and Mr. Mallette makes his purchases under these contracts, he advises with the rest of us, and on all items of a considerable nature his work comprises the details of the purchasing. I don't think we have a drawing or plan showing the way the 6 inch pipe, and all the other pipes of the district holder in East Lincoln and the blowers in the little booster house are all connected up, together with the line running out to University Place. We might have it, I don't think we have.

This company paid for all the expense of the fixtures in the present office such as counters and glass partitions. We took the bare room, and divided it up into different departments for office purposes, which is included in the item of $12,390.00; just for the partitions I think our contract on that was something like $2,300.00 or $2,500.00 our vouchers all show what payments were made on that; the balance of this item of office furniture was expended for linoleum that went on the floor, reugs, a new desk or two, awnings, railings there in the office, curtains and different items that were required to
732 furnish the office. I think we can furnish an inventory covering the item of office furniture $12,390.00. I don't know as the extensions as to prices would be the same as that, but we can furnish an inventory and verify it as to prices and quantity. The marble wainscoating was put in at the expense of the company as a part of this general figure, I did know what that cost, I think I know what our vouchers show but I wouldn't want to approximate it now; I made that contract myself; it was quite a substantial sum; it is equipment that can be used if we stay there after our 10 year lease is up; it is material that can be moved and used, it is ours, there is no provision in the contract for leaving it in the building.

In my school days and training I paid no attention to gas engineering, they didn't give a course at that time in gas engineering; I would not say there was any similarity between gas and electrical engineering. I have gotten my training, so far as I have gotten it in connection with the gas business, from a practical connection with the business beginning in June 1903; have had practical experience in all branches of the gas business since that time. As general man-

ager I have the oversight and general charge of the gas plant and its operation, including the manufacturing and distribution system. Generally and as a matter of policy to a certain extent, such information as the New York Office gets, and contact they have with this company is largely through me. I make the annual reports to Doherty & Company showing the years operations, but don't outline the policy, however, I have consulted about it usually; I make recommendations, I wouldn't want to say that I determine the policy. Whether or not I am perfectly capable of managing this gas plant, operating, manufacturing and selling gas and conducting the business, I have made Doherty & Company think so, so far.

733 As to the practical need either to this plant or community for having any connection with the New York Office, I hardly think it would be justifiable to make one person carry the responsibility in connection with the operation of this business, it has been usual in other companies to employ competent engineers, or consulting engineers, or firms for the purpose of getting their ideas as to methods of operation and the policy to be established in conducting the business; I hardly think it would be wise for this company to attempt to operate as an isolated property without obtaining consultation from those who are in touch with other properties, other conditions, and various methods of operation. I wouldn't say the custom mentioned is a custom built up by operating companies, such as the Doherty Company, I would think those companies were originated by companies of this character for such services. If I were the owner and operator of this gas plant I would be tickled to death to get the services we have gotten and are getting from Doherty & Company and would make an arrangement with them to pay Mr. Doherty $3,000 a year and Mr. Freaueff $2,500 a year merely for the privilege of having the benefits we now derive from their connection with this company. I feel it would be a proper expenditure of the money and a proper charge to deduct from the operating expenses here and paid by the gas consumers of this community. In addition to the $3,000 annual salary of Mr. Doherty and $2,500 of Mr. Freaueff we also pay $600 per annum to Mr. Freauff's brother as a retainer fee for his services as New York Counsel, and for extra services he gets extra pay: I feel that the services of Mr. Freauff's brother are of sufficient value to this company to justify the expenditure of $600 a year, and have used and felt the need of his services in the operation of this plant. He has transacted business in

734 this community in connection with the dollar gas case, has worked on the record some and outside of that he has rendered services locally in connection with the $500,000 three year notes and he and Mr. Strode consulted occasionally; I don't think Mr. Strode could have handled all that transaction perhaps, but Mr. Freauff with his New York Connections was able to handle a good many details that Mr. Strode could have handled by going down there, not with the financial end in New York, but the local end; those services are peculiar to Doherty and Freauff, for the company, but they are not attorneys.

In addition to the salaries mentioned Carl Gilbert receives $25 a

month for salary in connection with his services as assistant secretary. I don't think of anyone else who get a salary, that is not a regular salary. We pay the auditor sent out each year from New York for his services and expenses, I don't know what that amounts to maybe $200. or $300. say $300. somewhere around there. In addition I think we pay Doherty & Company outside of those salaries something as transfer agents, a fixed compensation, I don't know the amount, I would want to look that up, a nominal amount, I think we were to have our secretary to look that up. They get a fixed compensation for that. In addition we pay Doherty & Company for their services in receiving the interest on our bonded debt and paying it over to the bond holders; I think that amounts to ¼ of 1% of the amount handled; there is an advantage there, I remember when we were paying Parsons, McMillian Company that bond interest each year, unless we had it down there 10 days prior to that time the interest was due they charged a certain rate of interest for not having it there, a sum covering the period during which the money was not there prior to the 10th day requirement because it was not there. I would be glad to furnish an itemized statement of the amounts
735 in the aggregate of all the expenses paid by this company to Henry L. Doherty & Company as fixed expenses. And also anything paid to anybody connected with Doherty & Company. I will do that for the year 1912. I don't know how long Mr. Doherty has been drawing this $3,000. salary, I think it has been during all the time I have been connected with the company. I believe Mr. Freauff has drawn his $2,500. salary since he has been president; the $50. a month has been paid to Mr. Freauff's brother a year and a half or two years perhaps. I think since this case was heard in the United States Supreme Court. I think Mr. Gilbert as assistant secretary has received this $300. a year or $25. a month since the business transacted with Emerson, McMillian Company was transferred to Doherty & Company's Offices. I imagine that was in 1909. We have always paid this expense to the auditor for his annual visits as far as I know. I don't think the salary of Mr. Doherty or Mr. Freaueff has been increased lately, I think that has been the salary. I think there has been some items as office expenses for the New York Office, that they contracted down there on our account that they have paid for, the nature of those items was stationery, printing and stenographer's services; there was probably somet-ing for rental of the New York Office I will include that in my statement. I imagine all these salaries paid the New York office don't go to the individuals but go to Doherty & Company, I don't know. Doherty & Company negotiated the transaction for the $500,000. notes, which were sold I think in the fall of 1911, to take up some of our bonds, they have also taken part by raising funds or financing this company within the past five years by taking up the one year notes issued in 1907 when they became due and carried them themselves for some time; these notes I think were for $100,000. and were held locally to a certain extent by banks and individuals. They were

issued in 1907 for construction purposes; that was the time
736 they put in the large holder as I remember,—not prior to that time; those notes were taken up by Doherty & Company the year after they were issued, they were one year notes and were taken up when they were matured, in taking up the notes the holders drew on Doherty & Co. with the notes attached and Doherty & Co. provi-ed the funds to take care of them, to show that transaction we issued our notes and gave to Doherty & Co., but I don't remember whether we gave them notes for the entire amount or not, I think not; if we didn't give notes for the balance they either held the notes they obtained by the holder drawing on them or it appeared on our books as being owed by us to Doherty & Co. I think we paid interest to Doherty & Co. for such money as they advanced to take up the notes, I think we paid interest on some of it, I wouldn't say all of it.

As to any other transaction since Doherty & Co. have been connected with this Lincoln Co., in addition to the $500,000 note transaction, I think they carried the bond in this dollar gas suit put up by the National Surety Co.; in connection with this case the company by a bond to reimburse the consumers for this extra 20 cents in case the court should hold against the company, in giving that bond the company had to indemnify the surety company; in addition to this $100,000 note transaction and the $500,000 note transaction and this indemnity bond furnished the Doherty & Co., since they have been connected with this property, have at times paid bond interest and we have reimbursed them for it later. It has been our custom to keep a deposit when we had surplus funds, deposited with them as bankers also; I *inagim,* but wouldn't say it as a fact, when they had more than was required, they paid us interest on it, and when we had less deposited than we owed them they charged us interest on the balance we owed them at the same rate of six per cent.

737 The Henry L. Doherty Company hold some of the stock of the local company, I don't recollect how much, the books will show, I don't think our books show that they own very much of the stock; in addition to the stock owned by that firm used as a means of control of this company, there are several hundred purchasers of the stock around the country; there might be some of that stock held in the holding companies which Doherty & Co. are interested in, but I doubt it very much. I don't know how they own it whether mostly as individual owners, but I can't conceive how a holding company would get hold of it, the transaction there would be in the way of an outright purchase.

Returning to the other subject for a moment I am able to name another transaction since Doherty & Co. became connected with the company in which they financed the Lincoln company, when we bought the five hundred cubic foot holder Doherty & Co. was able to get the Western Gas & Construction Company to take notes that they would not have taken had we been standing on our own ground; I think we gave them notes for one of our water gas machines and that was absolutely due to the connection Doherty & Co. had with the property. They have always been able to establish a credit for

this company with concerns that might be caused to bear down a little heavily to make us pay up; I remember when I was first manager we had a big account with the Maryland Motor Company that we couldn't pay, and Doherty & Co. were finally able to get the Maryland Company to take our notes; they were also able to get the Detroit Stove Works to take notes for amounts we owed and couldn't pay them, and they wouldn't have taken them if we had at-empted to negotiate that sort of a transaction ourselves; I think they also got
the Denver Gas & Electric Company to take notes for amounts
738 we owed for coke we got and I am sure they wouldn't have
taken them had we done it ourselves. No it is not the matter of influence as a result of which our credit is bolstered up that I attach so much significance to in connection with Doherty & Co. rather than the actual raising of money for us in the east. I think I have included both those elements. I think the items I have mentioned are worth more than, and are a reasonable compensation for those salaries paid to the New York office.

I can explain the voucher under date of December first 1912 and the reference at the bottom to the additional discount from C. H. Dockery & Co., the figures are scratched out on the original voucher: C. H. Dockery & Co., are the people who sell us meters, I imagine that was an additional discount we received from them that was credited on their New York books, the meter transaction was conducted through the New York office in the first instance, but the New York office did not pay for the meters; this is their connection with that transaction, in their purchase of meters for all of their companies they are able to get a lower price on meters; this $53.07 was an additional discount but the $53.07 is erased which means that that item was already handled on our books by the same transaction, we had taken care of it, that would be my sup-osition that the secretary found it was taken care of or he had taken care of it in another way; we got the discount. We get the benefit of the actual contract as made between Doherty & Co. and these parties who furnish the supplies under the purchasing contracts all of it as far as I know; I am sure that as against this company Doherty & Co. did not get a rebate for their own personal benefit, they don't do their business in that way. This item of additional discount on this voucher to C. H. Dockery & Co. for $53.07 which is erased, implies that there was another discount and this was in addition to that; that is explained in this
739 way, they list their meters in a regular catalog and from that
we received 40% discount, and any discount from that would be an additional discount which would be on account of the quantity; explaining why it was not all included in one item in the first instance I might say that these discounts are not determined until the end of the year's business when it is discovered what quantity was purchased and I think is then adjusted. I think this was the regular discount and this 40% was in addition to that which was discovered after they determined the amount of the year's business, that is one of the benefits derived from the operation of a large number of properties. I would take it without knowing just how that was handled, if I had seen our original invoice with that scratched off, that that

had been handled on an invoice presented prior to this invoice and this was a duplication of that other.

The steam used by the Gas Company for the generation of gas is procured from the electrical department; the price we pay per year to the electrical department varies from possibly $600 to $800 per month; that is just a bookkeeping transaction, but whatever it is it enters into the cost of making the gas in our report and in these figures here. During the year 1912 my recollection is that we paid for steam per month approximately $700. I think our report here will show that; the steam is not sold by measurement, I think we have determined the amo-nt of the boiler capacity necessary for the operation of the gas works and from that figure out each month the amount of steam used, that is taken on the out-put of the gas; from that we determine the amount of steam used, some of those figures have been arbitrary, we have made our best effort to discover what the division should be, what the demand was on the electric plant for the steam used by the gas department and have done that
740 in dif-erent ways at different times; I have asked Mr. Montgomery to look up our detail scheme to derive those units now. We don't have a meter. At times we have estimated the quantity of steam used to produce a given quantity of gas, price by the 1,000 cubic feet, that has been one method. When we know the out-put of gas during a month from that we are able to conclude what we conceive to be the correct amount of steam used; of course, in the winter time we have heating to take care of, that isn't proportioned to the out-put at all. We get our steam from the electric department. Our building has radiators and get our heat that way by making a certain charge to the gas department for heat also a charge for steam used; the price is determined by the gas generated to the pound of steam in the electric plant arriving at the cost by taking the fuel, labor, and water; taking all elements that enter into the cost of producing the steam; no capital charge enters into the cost of the property used. Off hand I am not able to tell what the price of steam was during the year 1912, at this time, it varies from 650 to $800 I believe.

In the early days the electric department was subjected to municipal control in the way of fixing the rates, but after they injected the Traction Company into the situation I don't believe they have them; I wouldn't say that during my time there hasn't been an attempt on the part of the city to regulate our rates in the electric department, but there has been nothing done.

The matter of making these apportionments between the gas and electric departments both as to the items of expense and this item of steam is largely one arbitrarily made by the company and is a bookkeeping matter but based upon some reason as we see it for making some apportionment.

741 The gross income from the electric department during 1912 was $160,000 and some odd thousand dollars; the net income, that is the gross income less the operating expenses assigned to the electrical department is somewhere between $35,000 and $40,000; I could give the exact figures by looking at the reports. (Witness

refers to reports.) The net earnings from operation 1912 was $39,437.48: the gross earnings were $168,614.83; the operating expense itself deducted from the gross earnings is $129,177.35 not including any depreciation or interest; those figures are all in the electrical department; the operating expenses are arrived at in a large degree, by an arbitrary apportionment between the two departments on certain items, there is a division made on certain items, we have to get them by arbitration anyway, as on the items of clerical work, executive salaries, office rent, taxes and insurance; the apportionment made between the two departments is ordinarily 80% to the gas and 20% to the electric; that is based on several things, the income, the number of consumers in the departments, it depends on where the apportionment is made. In some instances the number of consumers determines, the out-put in others; we don't attempt to estimate that so much on the revenue basis. We haven't made any apportionment of property in the electric department such as we have here in the gas rate case so have not attempted to apportion these expenses incurred on account of both departments any more than upon the basis of the *mu*nber of consumers in the different departments, and the expenses attached, and in proportion to the manufacturing expenses.

The gross receipts in the gas department for 1912 were $282,-162.11, and the gross receipts in the electric department were $168,-614.00; that would make, comparing the gross receipts, the electric department about 37.4% and the gas would be the difference
742 by the sliding rule computation which makes it about 62½%. that would be on the basis of gross receipts from the two departments.

I don't remember the amount of general expenses assigned to the electrical department. I think I can get that (witness refers to memorandum) the general total expenses under that heading in 1912 we charged $60,719.87 to the gas I haven't the amount for the electric, assuming it to be $16,731.85, based on the sliding rule that is about 78½% to the gas and 21½% to the electric department, and that is the way we have apportioned it on those two items. If we apportioned these general expenses between these two departments on the basis of gross receipts in each department we charge 62% to the gas, or in round numbers $46,500.00 in round numbers computed on the sliding scale if apportioned on this percentage; as a matter of fact we did apportion $60,719.87. If we had apportioned to the electric department on the basis of gross receipts of each department we would have assigned to the electric department on this item of general expenses about $30,900.00; instead of $16,731.85 which we did assign to that department; this item of executive department general expenses, includes executive salaries, general clerical salaries, office expenses, incidental expenses, rent of executive offices, legal expenses, promoting new business and taxes; this item of rent of executive offices is the office building here in Lincoln.

We ceased making coal gas I think in 1909, I think it was right along in the summer of 1909, it has been nearly four years since we have made coal gas at all, during that time that coal gas plant has

stood idle. We justify that on the assumption that it enables us to make better contracts for oil, and also upon the assumption that some day oil may go up to a point of sale and production that it will be necessary for us to fall back on our coal gas plant. Concerning the price, in round numbers, the coal gas plant is carried in our
743 inventory, I don't remember the totals, I think the benches were $19,000.00; in the inventory in the old record the total was a little over $80,000.00; I think it would approximate that figure now. Whether the company is justified in tieing up that much capital in the coal gas plant because we are better able to contract for oil and because of the possibility that some day we may go back to making coal gas, I would put it this way; I don't know that I would advise it, unless there are some developments we can accomplish, of putting $80,000.00 in a coal gas plant if we didn't have it. in view of the fact that it was in I wouldn't advise doing away with it. If I were installing a plant here personally, I wouldn't construct a coal gas plant at this time; I have heard Mr. Doherty say he was in favor of making coal gas, but I have argued him out of it so far. From a personal standpoint my point is that having it already it would be unwise to wreck it, Mr. Doherty argues that we are going to make coal gas. Whether the public should be charged with it in the sense that they should pay a rate that would return a dividend on that valuation, I think it is useful and necessary for all of that equipment; a part of that has and a part has not, been used for over four years; it is a question in our minds whether it will be used again; Mr. Doherty argued that he had a plan in mind by which it would enable us to make coal gas cheaper than water gas and as quick as we get time to go over it we was going to make that effort. it is problematical whether we will make coal gas or not.

Cross-examination continued by Mr. Alton D. Adams:

I went to the office and made an effort to find the plan showing the apparatus and pipe at the district holder but was unable to find one, I think there is one. I would be glad to have made an off hand sketch explaining what the operation is out there. I have a
744 copy of Mr. Lea's report, in that report on the first written page the total reproduction cost of our property here is $1,306,075.00; Mr. Lea's report relates only to the gas property. I don't know it to be a fact that the total construction charges on the gas plant down to the end of December 1912 is $785,081.28, I don't put my finger on that item now so that I can verify that statement. Presupposing the elimination of the $22,000.00 and odd hundred dollars construction account from that total of $785,081.00, on the theory or fact whichever it may be, that the construction charge in 1900 was charged all over again to the extend of $22,000.00 in 1900, I am not able to recognize and do not recognize the $785,-081.00 as the total of 1912; I don't think any compilation in our reports shows that the gas department made such investment for any series of years. I was connected with the trial of this case before when it was before the court. Homer Honeywell was the manager

of the company at that time. I remember that Homer Honeywell, or somebody else, introduced a summary of construction charges up to 1907. Our books at the office show the construction charges, all of them made in the gas department since then. Mr. Adams asked me if I recognized those figures, I want to say that there is nothing in the reports that shows those figures in a compilation, unless we make a compilation, and then certain estimates must be taken off, certain items of construction, so that I can't recognize that unless I went over it carefully to see where you make the estimates. It is not possible for anyone to go to the records and pick that up without making some estimate, there is nothing of that figure shown here. I would rather not assume that to be correct or that my evidence will bear out that relation. I don't want to make any mistake about it. The figures given me were something over 60% of Mr. Lea's figures, about 66½%. Mr. Lea's figure of $1,306,075.00 is 66½% greater than the figure of $785,081.00 stated to be the construction
745 charge up to the end of 1912, it is something like that. I do not know anything about the removal of this plant in 1889 or 1890 from the old site to the present site. I have heard it was moved and have seen things that would lead me to believe that hearsay evidence was correct. I think Mr. Honeywell so testified in the last proceedings. I have not heard Mr. Honeywell's testimony recently, not for two or three years. I have nothing in mind that he said about the disappearance of that plant at the time of that removal. I haven't read that testimony since shortly after it was given, I think. Assuming that substantially $100,000.00 of construction charges that went into the old plant were completely wiped out and physical things disappeared from the face of the map at the time of the removal, right now I have no means of checking that assumption at all. I have never made any computation of that kind to see what the construction charges were on the property that disappeared at the time of the removal. I do not remember at all what Mr. Honeywell said as to the construction account he presented showing all that was ever charged to the gas plant for construction. I have not now at hand but we are going to compile the total construction charges added to the gas plant during the years 1907 to 1912 inclusive; it is not possible to go back over our books as they appear here now without making a deduction and apportioning some of the elements of charges appearing there for both departments. I do not testify that our books at the office do not show certain figures as the amounts added to the construction of the gas plant during the years 1907 to 1912 inclusive. I don't say whether the books at the office show it or not. Putting it this way these books when it comes to the construction records, the same items are included, first those items as the construction of both departments and no segregation is made in the books; again items are entered as gas works additions or construction accounts appearing individually, necessitating
746 a segregation. I can go to those records and make that segregation and make that compilation. The accounts are there every one of them so that can be made up; to explain the books there are certain construction accounts down there which on their face

perport to be construction accounts of the gas Company, and there are certain other construction accounts that don't carry that tag on their face, and other accounts as a matter of fact include some items on the gas plant that would be partly proportional to the gas department. I could have the construction charges, and all of the construction charges that I understand our books to show as applying to the gas property tomorrow morning and will have it here tomorrow.

Examining exhibit "P" of Mr. Lea's report that exhibit purports to show in the several columns corresponding to the several years from 1907 to 1912 inclusive the value of the property added to the gas plant, there it says total reproduction, real estate, buildings, distribution system, and works equipment. I have not made any computation to determine the amount of added value in that series of years from 1907 to 1912 according to Mr. Lea. Even assuming that those additions of Mr. Lea during the series of years from 1907 to 1912 inclusive foot up to $479,958.00 I have at present no figure to check that with me. I will be ready tomorrow morning to either confirm that figure or else tell what those additions estimated by Mr. Lea do sum up to. I tried to testify to the effect that I don't know the total amount of construction charges for the gas plant, shown by our books for the years 1907 to 1912 inclusive.

Now taking the construction charges to the gas plant that show as such on our books for the years 1907 to 1912 assumed to be $210,529.37 I think that is pretty close to it.

The $479,958.00 of estimated additions to value by Mr. Lea during those same series of years may be more than double the amount stated to be added to construction, that is a matter of arith-
747 metic, that appears about right.

In a way exhibits "31" to "77" being certain extracts from the construction charges in our books, a comparison with Mr. Lea's estimate of value or cost of reproduction. I will have to count how many headings of construction as taken from our books presented in those exhibits,—I will read the headings from our books of construction charges that have occurred during the years from 1907 to 1912 inclusive omitting the headings for construction charges that were in earlier years. That is I can read the construction accounts that I have used in this compilation; I can't read all without having the record before me because these are not all the construction accounts we have. I am glad to read the book headings of construction charges copied into exhibits "31" to "77" inclusive for the construction for the years 1907 to 1912 but I don't want to testify that these are the only headings on our books; first is the Generator House, Otis elevator, 7′ 6″ water gas machine set, 7′ 6″ water gas machine set, 6′ 6″ water gas machine set. The 6′ 6″ machine was installed in 1901, that wasn't from 1907 to 1912; 500,000 cubic foot holder; East Lincoln district holder; #8 Sturdevant Blower; that was a blower for the old water gas machine; #7 blower; new water gas exhauster and ergine; new blower at district holder; governor and connections for the 500,000 cubic foot holder; that makes eleven accounts. I have not valued the number of separate items valued in Mr. Lea's

exhibit for the reproduction cost of the gas buildings and works; whether in Mr. Lea's report there are nine enteries for buildings and seventy-three enteries for works and equipment I would have to go back through this thing and find where they are, I didn't make this report up, any portion of it. In exhibit "E" Mr. Lea has nine items under buildings there which Mr. Lea enters here under the heading "Summary of physical equipment", that is nine for buildings and 73 for works and equipment so that as compared with Mr. Lea there are 82 items at the works and in the buildings,

748 those items having been distributed over or having been acquired by the company through the entire series of years, more or less, that it has been operating, I have brought in here for the period from 1907 to 1912 only eleven items; that is absolutely correct. I don't remember the number whether it is a fact that in our books of construction items during the years from 1907 to 1912 inclusive are all made under eighteen headings for the gas plant or not. I think I would be able to testify that they are made under a very much less number of headings than Mr. Lea has used in his valuation of the buildings and equipment.

I have never added the totals of the items shown on our exhibits "31" to "77," I do not know whether that totals is $99,558.00; it is somewhere in that neighborhood, I think I did make a rough estimate. If the $99,558.00 is the correct addition to those items we have brought in here for the years 1907 to 1912, we are showing on these exhibits "31" to "77" $99,558.00 construction charges then in comparison during the years from 1907 to 1912 with the $479,958.00 of added value assumed to be shown in exhibit "P" of Mr. Lea's report.

I think in the items I have used in these extracts of our construction charges, under these eleven headings they very probably overlap Mr. Lea's report; I have items in there that he has valued somewhere else. If that were true, to the extent it is true, it would tend to make our construction charges appear to support or correspond with his valuation charges, for instance, under the compilation if, under the district holder we have included certain items of construction charges that Mr. Lea does not put into his estimate of the district holder at all it would tend to raise our construction charge as compared with his valuation.

Turning to Mr. Lea's report to exhibit "E" in his report

749 being the summary of physical equipment and is for detailed reproduction cost I would say that the following figures are correct as they appear in his report; district holder, booster house $836.00, 100,000 cubic foot holder $21,675.00; water piping district station $205.00; gas holder mains district station $507.00; man holes district station $1,778.00; twenty-five horse power motor district station $491.00; five horse power motor district station $186.00; Sturdevant blower, district station $209.00; Sturdevant blower, district station, again $244.00; making a total for those items of $26,161.00, that is the correct addition for the items just given. Our books show as per these exhibits "31" to "77" for a charge to construction on that district holder a net amount of $20,904.28 as they appear on

the records; I didn't say that these amounts covered the same items shown by Mr. Lea's figures for the reproduction cost of $26,161.00; his figures there are higher by the difference of between $20,904.00 and whatever that was. Perhaps in our book entries each one of the items just read from Mr. Lea's report are mentioned and the construction charge annexed thereto. I can make it a little more certain, I have the record here before me, you have picked these items out and I haven't any listing of them and I can't go back here off hand and tell you. On the question of whether we have in our construction charge on the East Lincoln dist-ict holder all the items just enumerated from Mr. Lea's report totaling $21,161.00 I would say I don't think so. I would not say that all the items indicated from Mr. Lea's report footing $26,161.00 are not included in our construction account headed "East Lincoln holder." As to the item or items not so included there is one blower, and a five horse power motor and I am not able to testify what Mr. Lea included for piping, or whether he included for mains what I have included. As to what
750 items if any found in this compilation of items in Mr. Lea's report footing up to $26,161.00 that are not included in our book charges under the heading "East Lincoln district holder" which foot up to $20,904.00 I would say I don't think the five horse power motor or one of the blowers were included, and I don't know about other items, I am not able to say just exactly what I mean to say is that it is possible that I can take this report of Mr. Lea's where the items are set out one by one and compare them with our own books and say whether Mr. Lea has covered those items represented in our books by name. Concerning two items in this list from Mr. Lea's report that are not in there I mean to testify that I am not able to say how much pipe Mr. Lea included or did not. Our construction charge on the East Lincoln holder I think includes all the pipe there, whether Mr. Lea included any more pipe out there, I don't know anything about Mr. Lea's compilation further than to know that Mr. Broadnax made the compilation of the inventory and Mr. Lea made the extensions; I had no hand in the compilation of Mr. Lea's part of that report. I didn't say that our book charges, our construction charges brought in here on exhibit "47" purport to cover all of those things that went into that equipment out there; I say that compilation shows what we entered under that construction account as part of the cost in the erection of the holder. Concerning what there is out there which I can name that isn't included in this list exhibit "47," headed "East Lincoln holder" there are a lot of batteries, and we have a telemetric gauge for one thing, I don't know what they cost; I don't think of anything else now except those batteries. Concerning Mr. Lea's report whether that covers or is supposed to cover all the property out there or not I can't testify as to Mr. Lea's extension, or the figures he used, or the items he figured on, Mr. Broadnax made the inventory and submitted it to Mr. Lea, I had no part in
751 it, other than to occasionally confer with Mr. Broadnax concerning the question as to why we brought in our book charges to compare with Mr. Lea's estimate of cost, I brought in our

book records to show what were the construction accounts as they show on our books and what the totals were.

I testify that those items as shown here are items entered into our construction account under that heading and as compared with the items Mr. Lea showed in his items for the East Lincoln holder; I don't testify that they are the same items Mr. Lea had, or that Mr. Lea's items are not the items I had.

Concerning the question of the cost of the land on the side of the street out there to our company on which the holder is located I testified that the lots on which the holder is located included lots 6 to 15 both inclusive and cost $1,000.00 the balance of the property including the house, cost us $3,500.00 making a total of $4,500.00 for all of the property on that street where the holder was, block 2. Our property on the other side of the street my recollection is the total cost of that was $3,350.00. On the land where the holder sets we have a bank of three electric transformers, they were put up there last week, I think their capacity is twenty-five kilowatts; those transformers are used in connection with our electric business here in the city. We rent that house and get $12.00 or $15.00 a month for it, $15.00 I think. I don't think by further examination I could tell at a subsequent hearing how far our book charges under the heading "East Lincoln property" covers the same property that Mr. Lea has made an estimate on. I am not familiar enough with what Mr. Lea has included in some items of his to say whether or not the tabulation I have shown would cover his, or what he has covered would cover ours. In the tabulation of the construction charges on the East Lincoln holder shown by our books in charged a level and rod that
752 is an ordinary engineering instrument, we did not break that up on the work, I think we still have it; it is charged in here as a part of that installation, it was contingent upon that construction, I don't believe we have ever used it since. I don't know whether Mr. Lea put a separate value on that level apart from the holder or not; I don't imagine so; I don't think he valued it in with that holder.

Concerning whether we had a contract with any concern to erect the steel work for that holder, I think we had a contract for that at $7,000.00, for the complete steel work erected in position on our foundation. I haven't been able to find a copy of that contract. I think I had it some time in the early part of this suit; I have mislaid it and haven't it now. It is a fact that the steel part of gas holder- are almost invariably erected by the makers by contract on the foundation; that is the regular practice. I thing it is true that we have charged under our heading "East Lincoln holder" the cost of that booster house out there, the brick building on the holder lot. I don't think Mr. Lea's report has that building charged in as as a part of the cost of the holder. I guess it is true that on the first page of exhibit"E" of Mr. Lea's report he shows district holder booster house entirely separate from the holder; the item isn't the complete cost for erection of that booster house, that is in my compilation, there are items added to that booster house that went into that construction but not into that construction account; my recollec-

tion is as to our book account of construction on that East Lincoln holder the items shown there relating to the booster house don't entirely cover the cost of the booster house. I can't tell the amount of the other items, I doubt if I can find that, there was some work done there, putting in a floor and cementing was done later, we made that building appear in the above form and then when this record was made up the first of January of this year it was in a different shape I might find out what that was, I won't
753 say I could, roughly I have no idea what it was.

As to whether the contract for that holder covered all of the steel work erected and in position, including inlet and outlet pipes, I don't know. As far as the erection of the steel work of the holder it having been let by contract I think we would have a substantial amount of pay roll on that to pay covering the items of the drafting necessary to laying this thing out, that would probably be chargable to the steel work and engineering. Excluding the superintendence and that sort of thing that is all the items I think of now; I mean the engineering superintendence not our own. We did not employ any engineering superintendence apart from the regular office of the Gas Company. Concerning the account "G" our voucher distribution record, the book which runs from June 30th 1910 to July 1911, the footings shown for the cost of that district holder to be $18,865.00 I have no means of checking that figure at this moment. Whether our pay roll as charged up to that East Lincoln holder in account "G-17" of our voucher distribution record amounting to $587.00 I could not confirm or deny that figure now; nor the statement in that same account of freight and drayage footing up to $601.00. I am not able at this moment to confirm or deny the same account, "G-17" on the district holder that the lumber and building materials are charged in the amount of $306.00.

Concerning the statement whether the excavation done out there was at a contract price per yard or at a contract price of $2900.00 for the entire excavation, the price was per yard. The excavation for the holder tank alone was not done at the contract price of $2900.00, the contract was so much per yard, on that yarding the price charged was something like $2927.00. If not a contract there was not a proposition made by the man who did the work to do it for $2900.00; there was a proposition to do it for $3900.00.
754 There was a contract for the building of that masonery tank. We would be called upon to foot part of the pay roll bills on the tank; in a number of instances we have paid in connection with a construction account of that sort for getting the ground ready, provided men to do this and that as things turned up, we had to run and lay the levels there and do a lot of digging ourselves, we always make it a point to aid the contractor all we can and we do it at our own expense. We had a contract price for that tank we absolutely did do work on the tank, our office force, after we had the contract, to the extent as shown by our books; I don't mean to say that this pay roll of $587.00 was consumed in any substantial part by work on the tank that we had a contract to pay a specific price for. It was consumed on work in connection with the holder that

I can't verify only by going back to the time cards when that work was done in connection with that holder and was entered on our books. I wouldn't say that I have any present recollection or idea where this $587.00 pay roll went to. Concerning where this $307.00 for lumber and building material went to, I think that was put into the tank to support the dirt and prevent it from falling in, we had to do that at our expense, the contractor wouldn't do it, the mason wouldn't do it, and we had to do it. Concerning where the item would be in this account for lumber and building materials to erect this building if this lumber all went into the tank, I wouldn't say it did, I couldn't tell you from this record where it all went. I wouldn't say that I think some of this must have gone into the booster house out there, I don't know.

The steel and iron work on this 500,000 cubic foot was erected by contract, with the Western Gas & Construction Co., I think the amount of the contract was $37,500.00. As I remember that included the erection of the steel and iron work in connection with the holder complete on foundation prepared by us. I think that
755 included the inlet and outlet pipes to the holder. Concerning whether the foundation for the 500,000 cubic foot holder was built by men hired by the day or by contract, I don't remember whether that was a contract job or not, I rather think it was. Assuming there was a contract for the foundation and a contract for the steel work complete erected thereon, that still left all the contingent items incident to the drafting and preparing the place and doing one thing and another always demanded by those doing the work of the company. There is no supervision of the work in these items I have entered here. We did supervise the work to see that we got what we contracted for. So whatever those costs were the company actually stood them anyway. Some of those charges incurred in connection with the holder, this holder, don't appear in the construction account. They were entered in the operating expenses. That would not be true pretty generally of our construction here. That applies only to this 500,000 cubic foot holder. I stated a while ago on this East Lincoln holder that we supervised that work, did some engineering work in connection with it, that is the regular employees of the company did. That was charged in the construction account later. There was an element here as a part of the construction which was later charged into operation, it was done later and that item is the item of painting and applies to the 500,000 cubic foot holder. Concerning the supervision, drafting, and engineering, on that East Lincoln holder, that was done by the company's regular employees, the cost of it was charged to construction, most of it appears in this construction account of the East Lincoln holder. It all appeared there until the account was closed out; if it was charged to the construction account of course it wasn't charged to the operating account too.

Exhibit "79" is the tabulation referred to.

756 Cross-examination continued by Mr. Foster:

This litigation has caused us to hold a good many conferences with Mr. Doherty and Mr. Frueauff. I don't remember how many times I have conferred with them about that in 1912. I don't remember how many times I was in New York to see them about this matter in 1912. I don't think it was ten times; I don't believe six times: I don't know whether five times. Concerning how many times they were out here to see about it I can't answer that. Mr. Frueauff is through here frequently, I have been over it with him a good many times from New York to Denver, St. Joe and Joplin sometimes in connection with the Doherty interests in other places. The matters about which I have gone to New York to consult him within the last two or three years have been practically always this matter of litigation. Concerning the greater part of the attention given this local company by Mr. Doherty and Mr. Frueauff being on account of this litigation would say largely by Mr. Frueauff, he has given it considerable attention. Mr. Doherty has given it some attention. It is not a fact that that has been about the only matter I have discussed with them in the last two years in connection with this company.

I was graduated before the school of instruction carried on by Doherty & Co. of Denver was started. I think Mr. Montgomery anti-dates myself on that; we are trying to educate Mr. Baxter now right here in Lincoln, and coming fine. Concerning whether any employees here in Lincoln of the company were ever in that school at Denver we have none now but have had; I guess maybe it was a year or a little over since we had one there; that was Mr. Matt Dungan, Mr. Bradford, Mr. S. W. Cheney and we have had other- that I don't think of at this moment. They received part of their training here, any men that leaves that Denver school will receive
757 considerable training anywhere, we don't consider that a man is through and a finished and complete product when he leaves that school. They are not brought here so they could have the benefit of my instruction but so I could have the benefit of theirs.

Concerning how long we have had our new business department, it has been here ever since I have had any connection with the property, I don't know how long before that. The expenses of this new business department are paid from operating expenses.

Concerning the kind of gas oil we were using in the water gas department in 1907, we were buying from the Standard Oil Co. at that time, from Coffeyville, I expect, or Sugarcreek, I wouldn't be sure where it came from. I don't think from the Kansas oil fields. In 1907 we were paying per gallon for it for a part of the year 4.1 cents and a part 4.2 cents. In 1908 part of the year we paid 4.2 cents and part 2.86 cents. In 1909 and 1910 2.7 cents. In 1911 we went on a new basis of paying for it, I don't know what the price has been; it has been a variable quantity. We are paying about 4.2 cents right now. The oil now comes from the Cudahy Refining Company, although we are not buying it from them. We buy that oil f. o. b. Lincoln. The other prices for the years from 1907 to the year 1911 inclusive were on the basis of f. o. b. Lincoln.

In connection with the sale of the $500,000.00 note we received

our remittance of the proceeds of the sale of those notes delivered to us in New York. Henry L. Doherty & Co. credit- our company with the amount. We were credit- with those notes at 97. A. B. Leach & Co. paid 97 for them.

758 Redirect examination by Mr. Rose:

Exhibit "79" came from exhibit "E" somewhere. Exhibit "E" of Mr. Lea's report purports to be the full reproduction cost including all overhead charges; as I remember his testimony he added 16% to get the reproduction total, there was that much variation from his net construction cost. Those figures are absolutely not comparable with the exhibit I made for any tabulation; the only difference is that my figures include the 16% for overhead charges; Mr. Lea's figures give the net construction cost without the overhead charges that enter into that.

Taking the first item from Mr. Lea's report, with respect to the district holder from his exhibit "I", as compared with the figures given in my tabulation, Mr. Lea gives $18685.00 as the net construction cost for that holder. Mr. Adams, who examined me on that item picked out the items, and for that corresponding item gave $26161.00.

Taking Mr. Lea's net construction cost for the district holder booster house his estimate was $721.00, the tabulation compiled by the Senior Mr. Adams gave $836.00.

The third item, water piping for district station, shown in exhibit "79" is $205.00, Mr. Lea's net construction cost for that item was $177.00.

The item of yard mains listed in exhibit "79" is listed at $537.00, Mr. Lea's estimate of the net construction cost of that item was $463.00.

The item of man holes in exhibit "79" is $1778.00; Mr. Lea's estimate of the net construction cost for that item was $1533.00.

Mr. Lea's net construction cost for the 25 horse power motor for the district station was $423.00; Exhibit "79" shows it $491.00.

759 Taking the item of the 5 horse power motor listed in exhibit "79" at $187.00; Mr. Lea's net construction cost is $160.00.

Take the item of the Sturdevant blower, the first one listed in exhibit "79" at $209.00; Mr. Lea's net construction cost on that item looks like $180.00, it is a little blurred.

Take the additional Sturdevant blower for district station listed in exhibit "79" at $244.00; Mr. Lea's estimate is $210.00.

The footings of the items embodied in exhibit "80", those items foot, as estimated by Mr. Lea $22,552.00.

Exhibits "79" and "80" offered and received in evidence.

In general in my exhibits I did not purport to cover items of buildings or distribution system which were checked over by other engineers. The cost of mains is pretty well established; and the cost of buildings, by other means.

Concerning the main items in attempting to exhibit the cost of these same appliances in the way of equipment, principally the main items were included; in some instances there was no record available, I did where they seemed to have a record that could be used, otherwise there were none that could be used for any purpose that required a foundation particularly. My tabulations covered the principal items of machinery and station equipment, to that character which the company had added, even from the year 1907. It covered no part of the distribution system; and some minor details I didn't purport to cover to make it complete. Concerning the cross examination about my own qualifications, I would say absolutely there are fundamental principles in engineering and mechanical engin*n*ering which are universal in application to all trades. The foundation of engineering is universal, and capable of adaptation to different industrial pursuits.

Concerning whether I took a general engineering course in
760 connection with my specific gas engineering; I took electrical engineering and some special work outside of that in engineering. I know an engineer in the employ of Henry L. Doherty & Company by the name of H. H. Scott. Concerning whether I relied upon persons who visited us infrequently would say that H. H. Scott was at one time superintendent of the electrical department here. Concerning whether under Mr. Van Riper, I think it was under Mr. Van Ness; I think he came here at the time Mr. Van Riper left and served under Mr. Van Ness; I think he was here a considerable time; he has been back here repeatedly since, during my administration several times. He was very familiar with the Lincoln situation.

Concerning the auditing services and my acquaintance with what is now regarded as common usage and common practice of having an inspection and audit of accounts of financial and commercial institutions in this country: I am, it is the only safe way to handle property and to keep the thing going as it should. That is the general custom in a proposition as important as this and should be followed. If they didn't have the Doherty auditing department, I would certainly say for my own protection, as a prudent manager and the protection of the investors whose property we handle, the protection of the public, and for the efficiency of the service I would employ some other independent auditing company at least once a year to check over our entire account. I am acquainted with the skill and efficiency of the auditor who has been coming here annually and making the annual audit of our accounts. I couldn't give anything but favorable criticism of his thoroughness and the painstaking character of the report and check he makes annually after an examination of this plant; I know he has had considerable experience along that line and has laid
a good foundation for it in doing that work. He goes over in
761 detail every scheme of operation to ascertain the condition of our accounts and the ac-uracy of our regular auditing employees. In my judgment that money is very well expended, and I think $200 or $300 per year very reasonable for a company whose accounts were of such a magnitude.

Concerning the manner of obtaining steam for manufacturing gas,

we do actually maintain boilers installed and owned by the company to generate our own steam. It has sufficient boiler capacity, boiler house and furnaces in connection with it, including the ground upon which they stand and the necessary part of the plant employed in the manufacture and distribution of gas. Concerning piping steam from our own electrical department we have no such thing as the purchase and sale of steam, simply a question of bookkeeping, crediting one department and debiting the other; the way we try to keep it the basis of that is the actual rateable cost of generating the part of the steam that is used for making gas, estimated upon our naked pay rolls, the cost of our fuel and the like of that, adding nothing for interest or any overhead charge, nor for capital or for depreciation; in other words counting the investment as capital of the gas department, as far as the investment is concerned. As a matter of economy in investment and operation it is our object of having but a single plant for generating steam although having two manufacturing departments. The system of combining the boilers for bunch of boilers tends to economy both in operation and in invested capital; it permits us to buy larger boilers, larger units to operate on a more economical basis because we get a better load factor where we have a comparitively larger number in operation than if we had but a few.

Notwithstanding the compensation we still regard a rateable share of the capital investment in the ground on which the steam plant is located in the steam plant including the boilers, connection,
762 furnaces, and boiler house as a part of the invested capital of the gas plant; the way we figure it that is a fair assessment, that is a part of the gas works equipment and there is no interest charge made for it. We use a part of that investment for the purpose of generating gas, the use and generation of steam is an unavoidable ingrediant absolutely that must be used in the manufacture of commercial water gas.

In apportioning the common items of expense the pay rolls of the separate plants are each charged to their own department. In so far as the specific cost of manufacturing gas is concerned that is charged, in our account system, directly to the cost of the gas. That is true also of the specific expenses of generating electricity; so in the main these two items of cost of manufacture are kept separate in fact. One cannot be confused with the other. Respecting the items that are apportioned the operations are combined where they can be of common utility to both plants in the interest of economy. In those cases we have to make an apportionment in order to get the final segregation of the total cost of the manufacture and distribution of gas in the one case and of electrical energy in the other. Taking for example the combined cost of generating steam, as to any definite relation in that case in the apportionment and total out-puts of the two plants, the total sales on the revenue basis could hardly be figured that way, if it were as a matter of fact, you would have to assign a much greater part than 62½% of the cost of generating steam for the gas plant under the assessment than you would if you were to adopt the revenue basis, and that would not be fair in any respect. Our system we have

used in that case is to charge the gas department with the proportion of the steam generated which is used in making the gas only, which is a small portion relatively to that used in developing power for the electric plant. On the other hand when we come to the general expense, like legal expenses, as for example like the cost of the recent special election which the city required the
763 company to defray: in the case of the special election the gas department made the expense, practically all of it. Respecting a franchise issue regarding the electrical department pending at that time, we had the occupation matter, I overlooked that, but the occasion for that election and the motive for it was due wholly to the controversy over the gas plant and the gas rate litigation. In my judgment as a matter of fairness and accuracy in accounting I do not think any part of that expense should be chargeable to the electric plant.

Concerning the item of legal expenses for the time, during which I was cross examined, that controversy arose almost entirely in the gas department. There is no justification at all in fairness to apportion that item of the general expenses to the different departments to the ratio of total revenue. In the operating department of this company, of which I am the head, in most cases we can pretty closely determine approximately the ratio of general expenses actually necessitated and incurred by one department or the other. Where we can determine that as to what in our opinion is a fair method of making the apportionment of given items of general expenses we employ in general for both departments that which on the basis will give the apportion which occasions the expense.

In the matter of bookkeeping, there is no relation in the expense of accounting and bookkeeping to the number of accounts that are carried. The relationship is almost proportionate, each account has its entries every month, credits and charges, and its own collection expenses every month. I think that is the only fair way of apportioning those expenses that is to apportion them in relation to the number of accounts carried in each department. Our system, and what we aim to *to* do, is to apportion practically to the number
764 of accounts. We could *we could* not do it in any other way without robbing one department or the other of the net results.

Concerning whether there is any way I can show what I regard as a fair apportionment to the different departments of this company, that is the elec*tirc* and gas departments, of the several items that go to make up the general expenses that should be in some way apportioned to the different departments, our usual percent is 80% and 20%. There are some expenses I can give you right now. I can get the exception and show why it was higher or lower. I can work them out and then justify them by what I regard as the rational and fair process. Concerning whether at the time this case was heard say at the close of 1907, the apportionment of these general items was made on the basis of two to one, I would say one-third and two-thirds, and I think we changed that afterwards. I think the conditions now require a change in that division, that

was the reason for making the changes where they were made because the conditions have changed.

Recross-examination by Mr. Adams:

Referring again to exhibit "79" where is shown the footing of $26,161.00 for certain items shown by Mr. Lea as the reproduction cost of the property at the East Lincoln holder whether I understand that $26,161.00 to represent what Mr. Lea says those items would cost in total, I understand that to be what Mr. Lea says what those items can be reproduced for, that is his heading and the term he uses right straight through, the replacement value to that property, I think would be my answer to that question. It would cost to reproduce it that amount of money. This company at its own cost got that property there. As to charging all of the cost for doing that to construction, there isn't any time charged for super-
765 intendence nor what you might call general engineering, except those items we charged all the costs of getting that property there in the condition and situation it is, to construction. That is shown in my sheet headed "East Lincoln holder", the items that are shown there were in that account at the time it was closed out, I don't say there *was*n't other items that entered in there afterwards. I don't know of any others. It is rediculous to look for them, I wouldn't know them if I found them, although I would just as soon hunt for them. My testimony is that I don't know whether that exhibit here as to the East Lincoln holder shows all it cost except engineering and supervision, and I don't know whether I can find it or not. It is correct that the *the* engineering and supervision of that holder is not charged in the exhibit I brought here; my time for superintendence and time for executive expense was charged into operation. I haven't said that rightly considered our operating expenses are too much by the amount that should have been charge-for that to construction of that holder. That wouldn't be my deduction hardly to imply that. I didn't say that our construction charges on the East Lincoln holder show all I can find except what I say was charged into the operating expenses. Any charge that isn't shown in our construction charges on the holder unless charged to operating expenses, would be charged in our general gas construction account. I can't find that, I don't know where it is, it is charged to construction that is not shown as a part of the construction cost of the East Lincoln holder, I don't know whether anyone else knows where that is or not. I haven't testified that my time and the time of certain other persons, engineers in the employ of the company, was charged to operation, but was devoted to this East Lincoln holder; I will testify that none of the executive salaries were charged into that construction account, but the time for the executive officers to a certain extent, was divided in this manner; their salaries were paid out of the expenses of the company
766 and charged to operating expenses.

Concerning our steam account, I don't know how many pounds we made during 1912. I can and will find out and bring

it here tomorrow, I want to explain part of that question, I can tell the number of pounds of water we paid for, and that is as near as I can come to the steam made. I might be able to make an estimate or deduction from that pounds of water. I can tell the actual number of cubic feet of water we paid the city for, whatever deduction there was would be an estimate of the number of pounds of steam we evaporated. I will give an estimate, or a meter reading reduced to pounds. What I have given here is the number of pounds of steam used in the electric department in 1912, or the number of pounds of water delivered to our boiler plant, and if I can get it I will give the number of pounds which I say was used by our electric plant and if I can get it the number of pounds used by our gas department.

Concerning our bookkeeping charge to the gas department on the estimated number of pounds of steam used by the gas department for all purposes, I would have to look into that to satisfy myself as to our present scheme of handling it, I have asked Mr. Montgomery to look it up. I will bring in in connection with the steam, the total charge made to the gas department for steam during 1912, as shown in our 1912 report in connection with that the total number of pounds of steam I estimate the gas department received for that sum of money which we made as a bookkeeping charge against that department.

Concerning the boiler capacity at our combined gas and electric plant, and the amount of boiler capacity I estimate to be fairly necessary for the exclusive use of the gas department. I can give now the boiler capacity and the amount apportioned to the gas department but will give it all at once and then we will have it all together.

767 Cross-examination continued by Mr. Morning:

Regarding the charge of the expense of the recent special election to the gas department, I don't remember what the expense was in round numbers. We haven't received an accounting from the city yet, we gave the city $1,500.00 for that expense. We intend to charge that into our operating expenses. That was an election called for the purpose of submitting the proposition for compromising this gas suit, but the proposition failed. It is my idea that that was a proper item to run into our operating expenses and should be taken out of the gross receipts of the gas department. We don't expect to hold a special election every year I wouldn't consider that item a constant item with the manufacture and sale of gas, it would depend on how we charge it up whether it would furnish a fair criterion as to what our normal operating expenses were.

Concerning the legal expenses testified to, the bulk of those were incurred in the gas department. To account for that for one reason we have had considerable litigation with reference to this dollar gas matter. Our gas business is a bigger business, we deal with more people and cover more streets. Barring the litigation over the dollar gas ordinance, the litigation regarding our franchise involves

our general franchise which covers both departments, I think our franchise here in the street is a franchise as we contend to operate both businesses. In the litigation over the occupation tax, we have a suit which involves the occupation taxes on both the gas and electric departments. Outside of that whatever litigation the company has is sued against the general corporation. Whether we have more suits of that kind that grow out of the gas department than the electric, in other suits conditions arise, which if not properly
768 handled suits would result. I think the gas department gives more of that than the electric. I do not think the electric department the one that creates the most danger or that there is more likelyhood of personal injuries; true the men have to climb the poles and handle the current and we have some personal injury cases growing out of that but we have had to pay personal injury cases where men have been overcome with gas in laying mains and doing different construction work and I think that is a little more hazardous than the electricity, also with the consumers bath rooms. Fortunately during my experience we have been able to keep out of court with suits in regard to people being killed with the use of gas. I didn't say we didn't have trouble, over it but fortunately we have kept out of court.

Mr. B. C. Adams recalled for further cross-examination.

By Mr. A. D. Adams:

Concerning whether I have any tabulation of six inch mains laid by the company since 1902 showing any different results than shown in our 1912 report, I have one here in the room, well I have several compilations here, I did not say that they tended to show what the correct amount is. This tabulation has not been introduced in evidence, this is my own tabulation. I have a tabulation here headed in red ink "Tables 1, 2, 3, & 4"; tending to show the feet of mains in different sizes from the records of the company. I have not stated that this is a correct transcript from the company's record; I will put it this way that that is a compilation gotten up from the company's records and is as accurate as we were able to get it.

Exhibits "83" and "84" offered and received in evidence.

This tabulation is headed "Street mains, Lincoln, Nebraska April 23, 1913," with my initials on it to show that it is my copy.
769 As to whether I believe them to be correct, the tabulation was made from the records of the company in as accurate a manner as we were able to make it.

Exhibit "85" tabulation headed "Street mains, April 23, 1913, B. C. A.," offered and received in evidence.

I have here and produce a drawing of the connections out at the East Lincoln holder, the drawing on this tracing cloth shows the connections at the district holder in East Lincoln, and shows on the drawing the location of the blower house and the blowers; it is not made to scale, but just gives the general idea of the connections and operations.

Exhibit "86" offered and received in evidence with permission to withdraw original and substitute a blue print therefor.

Explaining briefly the operation of these connections as connected with the East Lincoln holder, that is, the use of the blowers out there and the use of that holder system, will say that first there is in the blower house machinery consisting of a motor driven fan, also a motor driven positive exhauster, or booster, and the connections that go with them for the purpose of conveying gas either to or from the holder. The blowers are installed for the purpose of distributing gas in East Lincoln, and also for the purpose of pumping gas to the State Farm, University Place and Havelock. On the 10" mains there are two blowers shown as connected to those mains, the specific purpose of both of them is to raise the pressure of the gas at that point in order to distribute the gas in East Lincoln and points further east. Blower marked Exhibit "X" takes the gas from the holder at a low pressure and then raises the pressure on the discharge side to a predetermined point and delivers it into the mains leaving the holder station. That is a 6" main, it is taken into the
770 blower through a 10" main and then delivered from the blower through a 10", through a valve, and then into a "T" or cross, and then from there to the reducer into the 6" main. That 6" main connects to the 6" main on "X" Street, and then it goes into a 6" main on "33" Street. The last 6" main runs north and south on "33" Street. It connects to a 4" main on Holdrege Street running back into Lincoln and also east to the State Farm, University Place and Havelock. There is another blower in this house besides the "X" blower. The other blower is not shown on here; it should be shown. The connections as shown are not complete, that is an oversight on my part, but the connection for the other blower is exactly the same as this, and the other blower serves the same function as this one shown here. During the coming week I will indicate the other blower with its proper connections drawn on this Exhibit "86," that should have been shown here, I didn't see this drawing until this morning and didn't examine it carefully until just now.

The function of the blower omitted from this drawing as now executed is exactly the same as the function of the blower marked "X" that I have described, the only difference is that the blower not shown here hasn't the capacity for delivering as high a pressure as the one that is indicated here. There are two reasons for having two blowers there; primarily for the purpose of safety, not always being able to transmit the gas at the proper pressure, and also I might say, that one blower gives us considerably higher pressure than the other, and that was done for the purpose of getting gas out to University Place and Havelock where we were not able to get it out there with the lower pressure blower. I haven't given this tabulation a heading or name, but it is in reference to the steam consumption in the gas works and is compiled in answer to the request of the other day.

771 Exhibit "88," a tabulation of steam generation, offered and received in evidence.

This exhibit headed, "Gas Construction" was compiled in conformity with the request made here in the early part of the week (being exhibit "89") exhibit "89" represents the gas construction from 1873 to 1907 and other years, it has reference to that; and here is a listing of the vouchers covering our transactions with Henry L. Doherty & Co. also requested, being for the year 1912 (marked exhibit "90").

Exhibit "90" refers to the vouchers paid to Henry L. Doherty & Co. during 1912, covering every transaction according to the vouchers listed there, with Henry L. Doherty. As to whether I have compiled any other exhibits in reply to requests made at the last hearing, I think that exhausts my compilation of tables.

Cross-examination by Mr. Morning:

As to what precautions, if any, were required and what we did to maintain a certain pressure in the East Lincoln connection with this gas holder as required by the ordinance, exhibit "87," without figuring the pressure down town, we equipped all the services with service governors; answering whether we did anything to prevent any excessive service in the mains delivered at the consumers' meters, I say we have no excessive service in the mains. Answering as to excessive "pressure" instead of excessive service, yes. Concerning whether we installed service governors to meet that condition I would say not all together that. We did for some time after the installation of that holder, I think, reduce our plant pressure and whatever has been required of pressure has been on account of the demand from the general growth of the town. Concerning whether
772 it was necessary to install and did install anything in the way of valves in our mains between the plant and the East Lincoln holder, I would say not that had not already been installed, with the exception of some valves at the East Lincoln holder which were necessary in the operation of that station. As to installing valves at the East Lincoln holder to prevent back pressure on the mains towards the city when we were boosting the gas on the University Place service, we did put in valves, and could close them and prevent that, and they also installed "33rd" & Holdrege what we call a district governor which operates automatically to deliver pressure to the Lincoln system at, I think, five inches; that possibly has been raised since they first set it. It is true that the way we have equipped our mains in the vicinity of the East Lincoln holder we can increase the pressure on the outlying service, that is, the service to University Place, State Farm and Havelock, without correspondingly increasing the pressure on the city mains, that is by reason of these valves and this governor at "33rd" and Holdrege. These boosters do have an effect on the Lincoln service, by virtue of the operation of the district governor at "33rd" and Holdrege and it was very important to us to raise the pressure at that point because our distributing pipes were not large enough to carry the gas out there and deliver a pressure that made it possible to use the gas economically, and we found it very beneficial to use that pump, or either of

the pumps, to pump gas out to "33rd" and Holdrege and then deliver the gas into that tank at a higher pressure than we could get from the mains normally. The gas leaving the gas holder at East Lincoln destined for University Place passes up "33rd" Street, turns east on Holdrege, and the governor is connected at that turn, between the main running to the State Farm, University Place and Havelock into the distribution system in Lincoln; the main running to University Place and Havelock is a separate main from
773 their distribution system here in Lincoln, and is connected with the system either by valves or this district governor, and they can put any pressure they desire into that main going to those places without affecting the Lincoln pressure beyond a predetermined point. That was done by reason of this governor, so that when the pressure reaches a certain point from the East Lincoln holder automatically these valves and this governor will stop the pressure on the Lincoln service and any excessive pressure is carried on to Havelock and University Place, that is partly, true because the valves do not work automatically but the governor does, and if they were delivering a pressure at "33rd" and Holdrege Street of say five inches that governor located at that point would automatically reduce the pressure going into the Lincoln distribution system to five inches, or some other predetermined pressure or may be ten inches if we found we needed that much at that point. Assuming that we didn't have the University Place service or any of that outlying service at all we would not need the booster for the East Lincoln service, that enables us to build the pressure up to something like five inches, but in my judgment we would need the fan blower or booster, and as time goes on we may need the other one in the Lincoln system. It is our idea as the city grows, that we will probably have to pump gas back south on "33rd" Street. In speaking of one of these blowers as a fan I mean it is a blower. Eliminating these blowers and booster house our district blower would not serve the purpose of pressure as far as the East Lincoln service is concerned adequately and sufficiently for the reason of the holder is comparatively a light holder, it throws, I think, only a maximum of four inches only when it is full and when it is very nearly empty it would throw that much, I think it runs down to something like three and a half inches and a three and a half inch pressure at 33rd and "X" would not be sufficient to give our consumers service
774 in the Holdrege Street district, or on South 33rd and south of South 33rd and perhaps some other portion of that district and it would be necessary for us to raise that pressure in some manner. In my testimony the other day I stated that we already had considerable pressure at East Lincoln from the pressure that was furnished at the main plant, and that this East Lincoln holder was supplement to that, that is true, we are trying to accomplish two things there, and perhaps you did not catch that the other day, namely, we were attempting to not only help East Lincoln but other parts of the city and when we put in the district holder we relieved the mains leading from our plant into the city of carrying the gas that had, prior to the location of the holder been going into East

Lincoln, and in that manner improved the service all over the city, including South Lincoln, and all other portions that were making demand upon the plant at the time that East Lincoln was making demands. That was not done by a system of valves, but by simply putting the gas out into that district holder after midnight and then holding it there until noon of the next day when our demand became strong and then furnishing those people in East Lincoln from that holder, and then the amount of gas that was used from the holder of course, did not have to come through the mains in the business section of the town, so the relief that was obtained was beneficial to every one else. I might say that we were delivering, I will assume, "twenty-five thousand" cubic feet of gas per hour to East Lincoln over our peak load, when we put in that holder we just took that "twenty-five thousand" feet out of the mains down here and improved the pressure in those mains proportionately.

775 Mr. B. C. ADAMS, recalled for further examination:

Cross-examination in chief by Mr. Morning:

Concerning the third contract for the East Lincoln district holder which I was to look up and produce, as I remember that was the contract for the steelwork, but I can't say right oof- hand whether we have dug that up or not. That we — the $7,000.00 contract for the steel work. I believe we submitted here the contracts covering the masonery and excavation work; we submitted the contract under which the work was done and als- a proposal that was made covering the excavation work that we didn't accept. As I recollect we introduced in evidence a contract covering all the masonery work made with Perry Hahn, the contract price was in the neighborhood of $6,500.00, I haven't the exact figures before me. Concerning the basis on which that work was done would say there were no unit figures submitted in that contract for the masonery work, it was a lump sum and there were extras added later; in addition to the contract price we paid for the brick work and tank; unit figures on excavation were submitted; and I think that work was done for 70 cents a yard. That was done by Robert Malone. The Perry Hahn contract was simply for the construction of the masonery and cement work, that was more than $6,000.00, is was nearer $6,500.00. In the excavation work of Robert Malone the 70 cent per cubic yard covered the yardage he excavated. Concerning whether that included the disposal of the surplus dirt or backfilling, Mr. Malone's charge was 70 cents for the earth he figured was excavated there, approximately the cubical contents of the brick work tank, but that was not the entire excavation and I think Mr. Malone's testimony was to the effect that he made an error in figuring the excavation and consequently did not charge us enough for that work.

776 Concerning the actual amount paid Mr. Malone whether that included the removal of the surplus dirt I would say I think I told what the amount did include, it included only the cubical contents of that brick work tank, he did work in addition to that for which he didn't charge us. As to whether I mean that Mr.

Malone did or did not remove the surplus dirt, no, we sold some of the dirt as I remember and gave some away; we tried to sell it but were unsuccessful in selling but a very small part of it, and the balance was hauled away for the carting. The company was put to expense for removal of the dirt outside of what was paid Robert Malone, we spent considerable money leveling the ground and carrying the dirt from one part of the plot of ground to another and grading it. I don't know how much. I imagine I could ascertain that but that would take some little work to discover what those items were, I presume that could be discovered by a considerable amount of work. Whether Mr. Malone rendered an itemized bill, he rendered a bill but just what was on it I don't remember. It would be a bill that involved the necessary facts to determine the amount due him; that would not necessarily disclose the number of cubic yards of dirt removed; it disclosed the number Mr. Malone estimated, and his testimony shows that his estimate amount at that time was not the amount he excavated. It was Mr. Malone's theory when the contract was let there would be so many cubic yards of dirt, that was his opinion about it, he made two propositions to us, one whereby he would agree to excavate for that tank for a lump sum of $3,900.00; on the other hand he agreed to do the work for 70 cents per cubic yard; now Mr. Bradford, who was connected with the company at that time, and myself figured it over carefully to discover how many cubic yards we though- Mr. Malone would have to excavate and we though- possibly by doing it on that basis we could save some money.

777 So the contract was let to him for a fixed sum per cubic yard, and then Mr. Malone figured out the yardage after he did the work. It came to $2,900.00 and Mr. Malone has testified had he figured the yardage as he should it would have been higher. We actually paid him 70 cents a cubic yard and in the total amount of $2,900.00. Concerning the actual amount paid Perry Hahn for his part of the contract, if you will wait until I get the duplicate copies of the exhibits I need I believe I can answer you more efficiently.

Passing that part of the matter for the present, in regard to those missing contracts for the steel work, the Western Gas & Construction Co. furnished that steel work. I haven't made any effort to communicate with them for a copy of the contract to ascertain what it was, but our records will show the amount we paid them for that work. That was paid by a check and voucher. I have those and can produce them; I have a tabulation and we can produce the check and voucher I am sure. We had that contract here at one time but I don't know where the thing went to. I can answer the question about the East Lincoln holder now, as to what we paid Mr. Malone, the exact amount was $2,927.96 and we paid Mr. Hahn for the brick work in the tank the total amount of $6,683.27; we paid for the steel work $7,000.00 to the Western Gas & Construction Co. in seven different items; the items as I have them here are one payment of $3,500.00 another of $150.00; another of $200.00; another of $275.00; another of $275.00; another of $350.00 and another of

$2,250.00. Those amounts were all carried to our Voucher Distribution Record, or Accounts Payable Journal and entered there under a special account called East Lincoln holder, then the items I have read here were charged to our con-truction account with other items under that same account. None of the items entering into the construction of the East Lincoln holder are in any way reflected in our operating expenses for that current year, neither to increase the expense nor reduce the gross receipts.

778 With reference to the lots I have testified about, 7 to 15 block 2 Peck's Grove were the first lots purchased for $1,000.00, and we added some improvements as required by the city in the way of planting trees, etc., the bare lots cost us $1,000.00, where we put the holder; the next purchase covered the acquiring of lots 1 to 6 both inclusive in the same block, and also included the house on those lots; it is a story and a half house without a basement, there is a little hole under the kitchen though for storing vegetables in. At the time we bought it the house was possibly three years old. We paid for the six lots and the house $3,500.00. Then we bought lots 7 to 15 both inclusive in block 7, those were vacant lots, we paid $1,750.00 for that bunch of lots or for 1 to 6 inclusive we paid $3,350.00 both inclusive in that block; $1,750.00 for one bunch and the balance for the rest making $3,350.00 the sum total for the lots in block 7. The lots in block 2 and block 7 do not constitute two solid blocks; block 2 is a half a block, it is 100 feet wide and there is no alley between that and what would have constituted the whole block; they are 25 foot lots and 100 feet wide, and in block 7 we bough- half of the block,—all of the property on one side of the alley, those lots are approximately 25 feet; there is some variation in width and they are not all 25 feet. It is true I testified that when we bought the first batch of lots, that is lots 7 to 15 in block 2 for $1,000.00 the seller didn't know the Gas Company was interested in the purchase, therefore we were able to buy them at a lower price than we were late- able to buy, in other words after they discovered that the Gas Company was buying them we had to pay more for subsequent lots and in a sense were held up after they discovered that; the first batch of lots were the most undesireable

779 of the entire number we bought because it is further back from the principal street and next to the railroad; the lots numbered from 1 to 6 fronted on 33rd Street and were more valuable than lots 7 to 15; the lots across the street in block 7 that we purchased, undoubtedly were worth more than the first lots we bought, the party who sold those lots claimed they had a much greater value than we paid for them, we have always thought that had we improved that part of the country with the holder we wouldn't have had to pay as much for the lots. We partially felt because we had to buy out one or two parties to remove certain objections to the location of our holder there that it really subjected the Gas Company to an excessive valuation, and in order to purchase the house and lots 1 to 6 in block 2 we bought those lots in order to get a permit from the city in order to erect our holder, members of the committee who had that in charge intimated to me

in one way or another that it would be a difficult thing for them to grant the permit unless the party who owned the property was satisfied. Owing to the objections made we were required first to buy more ground to remove the objections than we really needed in order to be able to build the holder at all, and second I always thought that we paid more for lots 1 to 6 than the price at that time should have been, I also thought when we bought the lots in block seven that perhaps we came nearer to a reasonable valuation; we bought those lots sometime after the erection of the holder and the property had probably increased in value. I wouldn't say that the erection increased the value of the property, I have reference to the growth of that part of the town and the improvements that were being made there and the effort on the part of Woods Bros. to develop Peck's Grove, Woods Bros. told us it was an objectionable thing to have the holder there. I think there are no houses in Woods Bros. addition,
they just laid it out and plat-ed it and that was about four
780 years ago. I think laying out the addition raised the asking
price in that part of town and the selling price where property was sold but at that time it was moving more rapidly; the market there then was more than at the present time. I think it is true in all parts of town, even in the best business section there hasn't been any increased market, the market has been duller since that time. Concerning the items included in Mr. Lea's report under the organization and legal expenses contained in Exhibit "A" of his report for instance preliminary investigation $3,000.00, preparing articles of incorporation, surveying, abstracts, etc., $7,500.00, salaries of manager and clerical force during the two years' construction $18,000.00, incidental and traveling expenses $2,500.00, rent and stationery two years $2,000.00, as to what the company actually paid at the time this plant was installed for any or all of those matters I don't know from any personal recollection, I believe information of that character was submitted in the suit before if there was any to be had. In addition I know nothing about it only what I read from the previous record.

Concerning the item of working capital in Mr. Lea's report under the heading "Working capital" he has various items, material and supplies as of January first 1913 $16,334.42. As to whether this company did have on hand at that time material and supplies aggregating that sum I believe so; I believe that was Mr. Lea's method of arriving at that item, I think he took it right from our reports.

Later on he has an item subdivided under the figure "1" in his Exhibit "B" oil for enricher $447.39; that would be $447.39 divided by .03765 gallons of oil or approximately ten thousand gallons. I mean to say that we had ten thousand gallons of oil for enriching purposes at that time. I imagine that is close to the normal
stock of oil we carry probably it would average that, I think
781 it would, we have down there two ten thousand gallon tanks,—
I guess we have three ten thousand gallon tanks,—and one smaller than that besides two on the electric side that we use sometimes.

On the item of coke which is included at $1,636.55 that is $6.75

per ton. I imagine that is a close average to what our coke stock should be. We are continually laying in coke; we are continually using it, and we try to keep a reasonable amount on hand. We don't stock up periodically and carry it, we get the shipments as uniformly as we can. I rather think we have that such on hand now, I haven't looked at the stock but once and I didn't have in mind then making any effort to determine how much there was there, but I noticed the coke shed was pretty well filled up. We got about ten cars a month and they are shipped divided, those cars are divided uniformly over the month, to be correct about every three days. There are about thirty tons to the car, it comes from Milwaukee and the price of coke at this time at Milwaukee is $4.65, with freight per ton of $2.80, that is a short ton of two thousand pounds. The distinction between a short ton and a long ton is the difference in the number of pounds to the ton, I don't remember how much that difference is, some two hundred and some pounds, twenty-two hundred and forty pounds in a long ton.

The next item of gas material and supplies is entered as tar $194.63 that tar is manufactured here as a residual, a by-product. All of the material and expense of making that tar is entered elsewhere in our operating expenses. After we get the tar we run that in also as an item of capital, a part of the working capital; we don't carry the working capital account under such a head, but it is showed here as money tied up in stock.

The purifying material item here I think is a normal sum. With reference to our main stock that is gas and service pipe. We have
782 that much gas pipe on hand the first of this year, whether that was about the normal amount carried I would say that was apt to be under what we ordinarily carried because it was coming to the first of the year when those stocks are low.

Whether the following two items service stock and fitting stock that would be 1¼ inch pipe, I would say we have that much on hand.

The appliance stock $5,627.22 that covers all of the appliance that are held in the gas department as stock such as gas stoves, water heaters and various small appliance, industrial appliances and things of that sort. We have a stock of those on hand at this time. As compared with the valuation set out as of January first I don't know what the present stock is today, I imagine it would be more than that in view of the fact that we got in a car of stoves here recently, I haven't seen the last month's report and don't know what the situation is. Concerning the item of pipe and fixtures stock $1,248.75 we have carried as pipe and fixtures here such stock as would be represented as gas fixtures of various kinds, and small pipe that might be used for connecting. I suppose that could be included in our main stock or service stock enumerated above, but that has been done to give us an idea of how much saleable stock we had, that is, to represent such stock as we thought we would sell. That would really increase our appliance stock by that much.

Concerning this loan account stock $3,312.00 the last item under gas material and supplies, that largely covers the gas arcs that have been loaned to customers on a rental basis, also gas ranges loaned

for one purpose or another most always for temporary purposes. I suppose they are inventoried at their new price, I doubt if there are more than three or four articles of that sort, that is almost entirely gas arcs. Our purpose in having such a stock, the
783 gas arc has been rather expensive and we have found it rather difficult to sell it outright and in order to get out as many as possible we conceived the notion of renting them. A gas arc consists of four or five or perhaps a three mantel unit that we sell for store purposes. When we rent them it is for the purpose of illuminating store, ware houses, pool halls and such kind of buildings, instead of selling them we just rent them.

As to what our current monthly gas bill are ordinary*l*y at the present time I think about $22,000.00. Our revenue was $282,-000.00 and it would be 1/12 of that. Mr. Lea has indicated for the month of December, 1912, the current amount was $18,059.32. Those bills are paid at various times during the month, we have three different discount periods which comprise a period of six days; commencing with the first of the month and carrying it until the sixth, the second starting again on the the 11th and running to the 16th and the next from the 21st to the 26th. The town is divided into three districts, so that we will not have everyone paying their bills at once.

Inasmuch as these bills are being collected during the month as to whether it is or is not a fact we have out during the whole month $18,032.59 I wou*ll* say we have to look at it from this standpoint that at any particular time during the month we have sold so much gas for the previous thirty days, and that has been an investment to us and we are entitled to payment for the amount of gas that is outstanding, we are always more than 30 days behind, about 40 days. That is true on this basis, supposing the discount period comes on the first of the month and you start the first of September using gas and you use it until the first of October and then you get a bill the first of October for that month's co*m*sumptio- and we give you six days in which to pay it, that gives you 36 days and then perhaps yo*i* will run over, a lot of people do, we
784 ordinarily get the penalty but you can see that we cannot collect on the thirty day basis, we are always more than thirty days behind. It is not possible that some people will commence to take gas for less than a thirty day period and will pay up before the thirty days and that average it up. Even if each consumer pays his gas bill 12 times a year at least we get more than thirty days time on any one consumer because of this discount period hanging over after the thirty days and it has to be that way from the first of the month to the first of the second month, we get the second reading and there is thirty days consumption and we don't get the money until several days after that and in the meantime he has used more gas. He gets a leeway on us of the discount period of the extra six days.

Now the gas arrears Mr. Lea has entered here under subdivision "2" of his exhibit "B" as an item of working capital $3,822.68. That would include bills that had run over and hadn't been paid

within the last discount period and previous periods for the year, of course we add a penalty to that and that should be shown at the gross rate, and when we collect the penalty that goes into our receipts.

Concerning the items in oour petty ledger account $13,333.30, 80% to the gas department, that is $16,666.00 which less the 80% is $13,333.30; those cover such items as represent sales outside of gas, gas stoves, and all gas appliances, gas piep where we have sold it; that includes bills for everything outside the sale of gas. It does not include such as are ordinarily called bad debts, they wouldn't show here. These are live accounts and are considered collectable. As to how long we carry them before we charge them off, in some cases we might charge them off immediately but ordinarily we wouldn't make up our bad debt account until the first of the year, it is done every year. I would not say that none of those included in this item are not over a year old or approxi-
mately that, they might be over a year old because there are
785 such accounts that are being paid on right along. As to why we apportion 80% of those as a part of our working capital to the gas department and only 20% of them to the electric department I will say that Mr. Phillips and Mr. Lea went over that journal showing those various accounts and from an examination of the items shown there they concluded that an 80% and 20% division would be about right, as I understand it they handled it that way rather than dig out the various items. It does not represent a comparison of the gross receipts between the two departments, it is based on what the sales covered.

Now coming to the subdivision of exhibit "B" of Mr. Lea's report of cash on hand December 31st, 1912, $31,058.76, two thirds of which is apportioned to the gas department I did not make the apportionment there and cannot tell why 80% of that was taken instead of ⅔rds. Whether it would seem a little bit like discriminating in favor of the gas company when you divide the petty ledger accounts on the basis of 80% to the gas department and when you come to the cash to only assign ⅔rds to the gas department I will say that I explained that as based on what the sales were or would cover. Explaining how much belonged to the gas department for instance on this item 4 the ratio roughly of gross earnings in the gas department is about 62½% of the total earnings in both gas and electric departments, and I presume that was based on the ratio of the earnings in the gas department to the total earnings. As to whether it would give the gas department less cash than we have assigned it, or about 66⅔ I would say at the same time they might have made some investigation as to just what the money in the drawer did represent, it might have been gas or electricity. That was the amount of money in the office at the close of the day's business. We had that much on hand at that time when it was counted. That does not seem an abnormal amount. It would
not always average that amount for each day, the total
786 amount from both departments would average that amount.

Taking the next item, item 5, cash in banks December

31st, 1912, whether that was a rather abnormal amount would say that I don't beli-ve I testified that was an abnormal amount, that was about what we have carried for perhaps two years ordinarily in the bank accounts. Concerning whether the bank accounts were checking accounts I would say the Doherty account is not a checking account, the others are. Our bank books will show our monthly balances. I will make a statement showing the monthly balances in each of the banks including the months for 1912 by months.

Concerning the Henry L. Doherty & Co. item on January 1st which is $27,445.89, I can't say what the account with Henry L. Doherty & Co. on deposit is at the present time, I haven't seen the last account. It can be produced. It is kept there for the purpose of meeting interest charges at times, and taking care of various items that might arise, for instance, we might be called to pay for some construction item through the New York office, but that has been used almost ex-lusively for meeting interest. There is another reason for it besides permitting Doherty & Co. to pay right out of their bank our interest charge without using their money, namely, some years ago this company didn't have a credit here of but $10,000.00 and we had to work out some scheme whereby we could get short time loans easily and we found that we had to do business with more than one bank in order to increase our credit and the only way we could get accounts in other banks satisfactory to the bank was to borrow a given amount of money and keep a certain amount of that money on deposit; well the time came when we didn't have to get credit and were able to borrow not only $10,000.00 but $40,000.00 and we have made an effort to keep half as much money on deposit in those various banks as we were borrowing from them and we sent the balance to New York and charged them 6% for it and in that way we have paid our interest on the money we are borrwoing here to establish our credit; the litigation
787 that had been heaped on this company had made it very difficult, up to the time we established that policy for us to get money for any purposes; we wasn't able to discount our bills, we do that now; we never had money enough to do business with before but by borrowing what seems to you an excessive amount we have established our credit with four different banks and with the interest we got from that we paid Doherty & Co.

Whether with our monthly income of $18,000.00 to $20,000.00 current receipts that would necessitate our having very much credit taking care of the current business but to provide for improvements taking care of the crrent business but to provide for improvements and extensions in our two departments, and we have simply had to conform to the terms of our franchise which requires that we make the reasonable and necessary extensions, and we have done and had to do it out of the earnings and money we borrowed; we have never been able to finance our improvements as companies of this sort ordinarily would by the sale of some sort of security. We borrow from each of these banks where we have these deposits and they have our notes, mostly short time notes. And we deposit the money with them

to a certain extent. I think all of this interest we pay on the money borrowed is at 6%. The deposits do not draw interests.

Whether we have to borrow and use some of this money to pay bond interest I would say we earn our own bond interest, we have however, at times been short of cash and used to borrow money to pay bond interest; I might say it was used for that or for the purpose of taking care of our extensions. No the bond interest is not the one thing that keeps us hard up. The thing that has kept the company hard up is the demand for extensions and improvements. As to whether we are paying interest on substantially $1,500,000.00 bonds and notes, would say our interest bearing bonds in the amount
788 of $796,000.00 and a part of that interest is paid to ourselves.

We are paying interest on $500,000.00 of 3 year notes; I don't recollect that we are paying interest on anything else; the interest charge we carry on our books for first mortgage bonds, is simply a matter of bookkeeping because the interest is charged and again credited, there is no passage of money. Out of both departments we are paying interest on at least $1,200,000.00 including the notes. The total amount of interest paid out in 1912 was $79,240.23 and that interest covers both the gas and electric departments. That is all the interest we paid out during the year for both departments. We did not apportion that as between the departments at all. The amount of interest I have just given I think does not include interest on $333,000.00 bonds which are paid and held as collateral. That total amount I should have said does include an accrual of interest on the $333,000.00 for first mortgage bonds: the total amount of $79,711.69 that was paid out in 1912 was made up as follows: we paid out on the consolidated mortgage 5% bonds, $38,966.65 that was paid out thought the Chemical National Bank,—either through the Chemical National Bank or H. L. Doherty & Co.,—if they paid it they probably sent it through the Chemical National Bank. We paid interest on the first mortgage bonds $8,325.00 to ourselves. We did that in order to offset that credit to ourselves, we charged ourselves with the interest. That was done for the reason that the first mortgage bond- which came due in 1911 were not taken up, they were purchased and extended to use as collateral behind the $500,000.00 three year notes and in order to carry out the transaction as a matter of bookkeeping we accrue the interest and pay it to ourselves.

As to whether that was the means instead of taking up the mortgage bonds, we perserved their life and used them to protect these loaners who took the notes for first mortgage security. I would say yes, we put additional security but had to handle it that way
789 to get them to carry the loan. We also paid on Bills Payable the amount of $32,168.44 and we paid an item of interest in advance in the amount of $251.60 making the total paid out of $79,711.69; that sum includes the amount we paid to ourselves and should be deducted to show the actual net. That is $8,325.00 should be deducted to get the net of $71,386.69. That interest was accrued and paid last year and was all the interest that did accrue last year.

I can't say right off hand how much we paid last year for extensions in the gas department; approximately somewhere around $50,-

000.00. In a general way that covered extensions of mains, purchase of meters, governors, service pipe, meter connections, and repair construction. Whether we had those things in stock, like meters in stock and pipe in stock, called extension until actually put in use, will say the report shows what is in stock, and what is actually put into service. It is put into the construction account when it is put into use not when it is bought. So our meters in stock are not in the construction account. The exact amount for extensions last year as shown by our books,—the total amount expended for construction work in 1912,—was $50,066.77; concerning whether that is in the gas department, I am glad you called my attention to that; that was in both departments, the amount spent in the gas deparment was as follows: for gas works additions $11,485.88; for street main extensions $7,318.22; for new service pipes $271.81; for meters and connections $958.76; then we have an item here under the heading of office furniture and equipment and part of that is chargeable to gas amounting to total amount of $7,133.05; of which I would say off hand 80% was chargeable to the gas department. No part of that fixtures item is charged to current operating expenses, that is what we consider construction; and the total amount of construction as exhibited there is $50,066.77; I have given the items that
790 can be segregated to show what went into the gas department, with the exception of the furniture and fixtures which should be apportioned, and the report will show also the different items that went to make that up by the headings I read off and you can find out how much were for governors, and under governors you can find how much is for wages and how much for material and how much miscellaneous, and how much for the governors themselves. Those items for stock was what was actually put in place.

We carry casualty insurance on our employees and laborers. We pay a rate of $2.00 a $1,000.00, on the pay roll, that is, the amount of the pay roll involved in the insured department whatever it is. If we were to construct a gas plant the casualty insurance would be figured $2.00 per $1,000.00 on the pay roll involved in that construction; that charge used to be higher than now, it used to be $3.75, but Mr. Doherty has entered into a blanket contract for liability insurance and by virtue of that we have been able to reduce the rate $1.75 per $1,000.00; I presume Mr. Lea figured the $2.00 which would be the ordinary rate. The rate of interest we have been paying, and did pay on bills payable was 6%, these bills payable are pretty heavily secured by bonds, it comes of that trouble of extending these mortgage bonds to use them and we used in addition $400,000.00 second mortgages to put behind the $500,000.00, three year notes; we had to put that up because I imagine somebody would get Mr. Fred Foster to try and get the Railway Commission to prevent us from issuing those notes.

When I was on the stand before I was asked regarding the method of determining the amount of steam charged to the gas department and furnished by the electric department, I said we did not use a meter. It being suggested that Mr. Phillips testified somewhere that we did use a meter, that comes from an accountant trying to become

653

an engineer, the fact is that we didn't use a meter at all. As to our furnishing the data on that I think I said that Mr. Montgomery would compile that and he did; that has been offered and
791 received in evidence as Exhibit "88" being the compilation with reference to the steam, for the charge for the steam against the gas department that exhibit covers that, showing the subdivision of the charges which are itemized under the headings, steam, electricity and water. Mr. Montgomery prepared that exhibit, he is the general superintendent of the company; whether I would be able to testify as the accuracy of the figures of my own knowledge to varify the figures, methods, conclusions, and calculations involved in that exhibit would say the method is correct as far as the arithmetic I don't know, it looks about right to me. In a general way the method of arriving at the amount charged the gas department for steam furnished by our electric department, the steam is figured on the basis of 20 pounds of coal per 1,000 cubic feet of gas made during the months of October, November, December, January, February and March, and during the other six months of the year on the basis of 15 pounds of coal per 1,000 cubic feet of gas made, the cost of coal includes all of the items which go to make the expense of steam, generation on line 3,009 of our old *cal*ssification, this gives an amount varying from $600.00 to $950.00 per month which is credited to the electric department and charged to the gas department; with this amount the gas department is also charged under the steam account with the water and electricity used in the manufacturing department, and the actual charges made to the gas plant and credits given to the electric plant for the 12 months during the past year are shown in that Exhibit "88." As to what causes the variation between the various months as to the consumption of the amount of coal per thousand cubic feet of gas made, would say the amount varies for the reason that the charges include steam used for gas generation, the booster, the exhauster and steam heat for buildings and holders, and the amount of steam required by these different pieces of apparatus varies according to the amount of gas that is sent out and the temperature of the room at the plant that are heated with steam. The fact that the heating of the build-
792 ings and the heating of the holders vary accounts for the difference would say that I don't think that is the large item, I think the large item is determined by the amount of steam we use for the gas generator, booster and exhauster, it takes more in the winter time depending on how much gas we are sending out, and we send out more gas in winter; that is, the larger the out-put the stronger the charge has to be per 1,000 cubic feet, because we are using steam for more purposes. As to whether it does not cost as much for steam when you have a small out-put relatively as a large out-put per 1,000 cubic feet would say that with the six months commencing with October and ending in March we make a charge based on 20 pounds of coal per 1,000 cubic feet of gas made and during the balance of the year we make a charge based on 15 pounds of coal per 1,000 cubic feet of gas made during those six months and where we use the 15 pound basis our out-put is small as compared to the

other six months and of course, we don't use any steam heating during the other six months, but in winter we have to use a considerable quantity for heating the holders, and tanks, and buildings, and we also have to use the exhauster and booster longer hours during the day in order to supply the added amount of gas we are sending out over that of the summer months, consequently we are charged on a higher basis during the winter months than during the summer months. It doesn't require any more steam per thousand in our water gas generator to make gas, but we make more gas, the gas is required by the city in larger volumes consequently we have to blow more gas up town with our booster which takes an additional amount more than in the summer time; during the summer time we may not use that booster but one hour a day while in the winter months we might use it five hours a day to get the gas up town. As to determining accurately the amount of steam, we can't measure the steam, but we can get at it by determining the size of the engines, the number of hours they are running, the amount of
793 steam it takes per horse power and the way this thing was based as I remember now was by making an actual test, using a boiler in the electric plant and taking from it steam for the gas works which gave a sort of basis upon which to work. We have done that several times since I have been here to arrive at some basis for making a division, and those who made the tests finally determined upon these different tests to get the variation for the different months of the year. In Exhibit "88" for each month we have divided the charge into three elements, steam, electricity and water. The reason we charge for electricity is that comes under our classification as being charged under that account, it is the electricity that the gas department uses, the water is the water the gas department uses for various purposes, one for cooling water in the condensers for instance in Exhibit "88" in January there is an item for water of $137.89, we don't get that water from the electric department we get it from the city. It is entered into this account showing the total cost as charged; the account is enumerated in that tabulation and the steam expense itself was $860.00, and addition items charged to the account and set opposite is $59.00 for electricity and $137.89 for water; electricity is charged against the gas department and in favor of the electric department. The reason this water item of $137.89 enters into this item is that under our classification, Mr. Morning, we provide for handling these accounts in such a manner that such and such things must be charged to such and such accounts; Mr. Montgomery has taken the item of steam and charged it at $860.00 electricity at $59.14 and the item of water at $137.89 and shows that those accounts have been distributed to the accounts set opposite as follows; account #1100 got $350.00 of that total amount, the three items I first read; and account #1110 got $100.00 of it; and account #1116 got $410.00 of it. Those numbers 1100,
1110 and 1116 are gas accounts shown on page 11 of the op-
794 erating account. Account *Account* #1100 shows the heading in the operating report of steam for generating water gas; account #1110 shows the heading just steam; account 1116 is shown

under the heading works, expense and supply. The reason this thing is made out and shown on this record you have shows how the items of steam, water and electricity enter into operating under the heading of steam for generating water steam and works expense and supplies because that is the final analysis which you don't have before you in our operating report. We buy our water from the city that is all entered into our final transactions and entered into operating expenses once and only once. This is only a mere matter of distribution for bookkeeping purposes and hasn't anything to do with the sum total in operating expenses except it shows how it has been charged, it don't effect the total. Concerning whether it effects the total as far as the gas is concerned would state it is the sum total amount of how it should be charged to the gas department, I will have to correct my testimony a little bit, the items steam, electricity and water are not all divided as indicated there, first, it is just the steam divided into those three accounts. The three accounts charged of $350.00 in one item $100.00 and $410.00 in another make $860.00 which is the steam alone. I can give you the reason why these are apportioned to different accounts, I just said that the steam is distributed as shown by those account numbers on the right hand side of that exhibit under the heading of January $860.00; now in addition there went into our expense $59.14 for electricity, $137.89 for water and the total of all those items amount to $1,057.03; and that total amount shows in our January operating record on page 20 and is made up of a charge to water gas generation, of $350.00 to water, for purification and storage $297.03, and works expense $410.00 that makes the total of $1,057.03 that I have read there from the
795 credit side; now on the debit you will find that the electric department gets steam $860.00 electricity $59.14, water $137.89. The reason for dividing steam into three different accounts is simply a matter of accounting for determining our operating expenses, we think that method gives us the best information of how to conduct the operation of the works. The item we have charged here steam, water and electricity includes the labor of producing the steam, and all the expenses in producing it. No item of labor is charged elsewhere, but that does not include any interest or overhead charge.

Exhibit "90" is the statement of moneys paid by this company to Henry L. Doherty & Co. from January 1st 1907 to January 1st 1913 which exhibit I was to furnish. I made no effort to go back of the year 1912, anyhow exhibit "90" merely includes those payment made in the year 1912. The transaction under date of March 14th 1912 in exhibit "90" voucher # 11981 draft to H. L. Doherty & Co. for $10,000.00 exchange on draft $6.00 total $10,006.00 was a deposit we made with Doherty & Co.'s bank. The next entry under date of March 26th 1912 voucher # 12002 was another deposit made in their bank. The credit balance $35,809.27 of February 1st represents the amount of money we had on deposit down there at that time. March 1st 1912 credit balance $35,311.41 indicates the amount we then had on deposit down there on March 1st.

Included in voucher # 12463 under date of April 26th 1912 the

item "Expense Paul R. Jones, 1/31/12, $125.00" was the expense of the audit, or a part of it, he was an auditor sent out to audit our books. The item below under the 30th of the same month "services 1/21-1/31-12, 11 days Paul R. Jones $220.00" covered part of the same item for the same service.

April 1st we had on deposit with Doherty & Co. a credit balance of $54,494.82.

796 Voucher # 12890 in exhibit "88" under date of July 23, 1912 where is shown an item "Draft on H. L. D. & Co. account purchased $5,000.00 par value Havelock Elec. Co. common stock $5,000.00" indicates that we bought $5,000.00 worth of common stock of the Havelock Electric Co. and at that time we didn't want the transaction to pass through this office and we drew a draft on our New York account. We didn't want it known that we were buying into that company, the Traction Company was furnishing them powere and we didn't want to make it public. We are furnishing the powere there now. The $5,000.00 purchase of the stock of the Havelock Electric Co. enters into our construction account here, that would be a part of the plant account,—not the gas,—it would be a part of the electric plant account that wasn't in the gas department.

The item in voucher # 13250 under date of September 27, note to W. E. Quillan $500.00, in explanation of that Mr. Quillan is in the employ of *the* Doherty & Co., he came through here on his way to New York with $500.00 that he didn't know what to do with and we gave him a note for it and took the money.

At the close of exhibit "90" December 1st 1912 we had a credit balance with Doherty & Co. of $27,430.49 and that was our balance December 1st there. In addition to that the item under date of December 31st "interest on account 7/1/12 to 1/1/13 $1,068.78" that is the 6% on our credit balance down there during that period; that item of interest enters into our receipts here in miscellaneous earnings, and is shown on our financial report; that goes in just as our gas earnings do but in a different line, segregated from it, but in our showing of gross earnings we enter these receipts and the items appear as a part of our earnings.

In making up our construction account we show the total amount expended during the year for what we consider extensions, we show the items in detail. Concerning whether we have displaced
797 one item and put in a new one, for illustration a water gas set, would say that we have never displaced an old one with a new one. We don't take it out of commission and put in a new one. We absolutely have all that we ever had in commission, that is four, we are actually using one, but it is impossible to get along with one machine even though it has the capacity of furnishing more than the demand upon the company. It is possible for us to make all the gas required with one 7′ 6″ water gas set but we can't run that day after day or year after year, we alternate and put the others into work. It has absolutely happened as a matter of practice that we have had to have more than one reserve water gas set, that thing has been experienced here several times, and the reason for the necessity of having more than two machines is this: when we shut

down a machine we shut it down at the last moment because we run it as long as we safely can and when it is shut down it takes a terrible long time to repair it, it can't be done over night, it takes several days and sometime- several weeks to repair it, and in running another machine we are liable to have trouble with that time and again we have had to shut down on a machine in operating condition while the other one is shut down for overhauling and we must have something to take care of the plant; we have no assurance that that condition might not exist here tomorrow, and it it should our 6′ 6″ will not handle our load and we can use that with the Springer set as a last resort to help it out. I am glad to say it is at least two years since we actually used the Springer set, but you must consider that the two 7′ 6″ machines are absolutely new machines and they are in as good condition as two machines can be and be handled during the first years of their use; we ought not to have any trouble with either of those machines but we have had trouble with both of them. The next time we buy water gas sets, we will carry the old sets on our books as a part of the active operating plant just as long as they can be used. We have added the total cost of the new water
798 gas sets to the construction account and charged nothing off on account of the old ones, for this reason, the old ones are still useful machines and necessary in the operation of the property as a matter of precaution, safety and service to the public, the hazard we would undergo, if we shut them down forever might involve us in law suits involving hundreds of thousands of dollars. The city has experienced trouble in not *have* reserve capacity itself.

Concerning my testimony relating to exhibit "35" showing a payment made to the Western Gas & Construction Co. according to our records, including freight, when I spoke of an allowance having been made of $400.00 on the old machine I meant that allowance of $400.00 covers that made on an old engine we returned to that company, it was a steam driven engine originally used for the purpose of driving a blower. That old machine was one of the items in our construction account at that time when we turned it back to the company we credited it, or charged it off from the construction account; that will appear in the 1913 report where that credit was made. I don't say that was made that year, but it has been taken out of the construction account. Oh I don't know how many other items besides that, that we have taken off of our construction account; but that was our practice whenever we did away with a piece of apparatus we took it out of our construction account; I can give another instance at least, at the time we sold those boxes to Charles Hulswith & Co., we got some money from those, we got the cash for it, and put that into our miscellaneous earnings and credited the plant account. I don't recollect the transaction, and would have to look it up as to whether we credited the construction account with the exact amount we received from them. We would not credit the construction account with the original amount at which they were carried, we credited it with what we got for them. Assuming that we carried
799 them in our construction account at the new price and sold them at a junk price, we credited them with the price we

actually got; and that is what we did with this machine for which we got $400.00. Concerning whether the difference for what we got for the discarded item and what we originally carried it in the construction account would still remain in the construction account, I would say as a reproduction value proposition it would but when you come to the present value proposition it would be what we credited. Taking the construction account as a check on what we actually have in this plant, we have all of the items entered there at their original cost, whatever we have taken off, we have taken off what we realized after we discarded the item, that is all we took off. The new item was handled on the construction account in this way it takes care of the thing, but you are trying to make it appear that it is something that ought not to be. If we bought an old engine at $1,000.00 and put in a new one that cost $2,000.00 we wouldn't add to our construction item $2,000.00, we would add $1,000.00 and the difference would be charged to operation. That is what we did in this case, we bought another piece of apparatus, that # 7 Sturdevant blower which cost us $1,060.00 but we didn't charge all of that to construction, we charged to construction the difference between what the old piece cost and the new; I am sure about that, and when you go back to those old books they handled it the same way, you will find it all through our construction for replacement, we only charge the additional amount to construction and the rest of the cost to operation. Sure it has the effect on the operating expense of increasing it to the extent of these charges, and to that extent, keeping up replacement out of operating expense. My knowledge as to the method of accounting and bookkeeping extends only from the time I came here, ever since July 1906, back of that I have no
800 knowledge, but that was always the plan of the company during the management of our people at least.

Concerning my direct testimony heretofore given regarding the 7′ 6″ water gas set three years old, and the total cost given as $10,900.00 and whether that was the price actually paid for it, would say this tabulation shows exactly what was paid; we paid the Western Gas & Construction Co. $10,025.00 and they allowed us in addition to that $841.50 and drayage in the amount of $70.00, and then there was a credit of $8.40 making a total for that machine of $10,925.10; that allowance of $841.50 was the freight on the machine we paid getting it out here, we paid it and they gave us credit on the price for it, and the same for the drayage, their contract provided for delivery and setting up.

Concerning the erection of these gas holder- erected under my administration, and the making of extensions during that time as to whether the company incurred any expense in the way of engineering, I would say yes, but only in a nominal way, I think we hired perhaps a surveyor, or something of that kind; and at one time we hired Prof. Stout to make some plans and give us some advice, what was paid for that would be merely nominal.

The company's office before we moved to our present location at 14th & O was between 13th and 14th on O, 1324 O St., a lit-*el* over a half a block west. Our floor space there was 25 feet on the ground

floor running back 130 feet, and we had possibly 3,000 square feet up stairs and we had a basement under the ground floor. Our main floor did not extend to the alley, but we had a little extrance, then we had a basement, and the floor space above. We paid rent for the ground floor on a lease that would have expired in a year, $125.00 a month and for the space up stairs we paid $80.00 a month; and we paid for the gas shop in the rear $40.00, and then we had another little office up stairs that we paid $25.00 for, that total rental was $270.00 but that don't sound like enough,
801 we used to pay for all of our rental on that property $300.00 a month, I am short somewhere. That was half a block nearer the center of town than our present office. It wasn't on the corner, as far as location is concerned it was a prominent location, but we didn't have a good front and people couldn't find us easily. We didn't have a good front for display purposes, nor a front that could be easily discovered. Yes people lost their way getting to the office, I found a number of people that couldn't find the gas office. The office was there about 9 years. That wasn't considered a high rental location when we rented it, we had a ten year lease on the property, and $125.00 was the amount fixed when we first took it. Mr. Schlissinger told me if we wanted to renew our lease we would have to pay $275.00 for the ground floor. Concerning whether any location on the south side along in that locality is a high rental location, I don't know anything about what other people are paying there. Yes sure, as compared to other streets, O Street is a high rental street and the south side is higher than the north, that is the preference of location.

Yes I have the items paid to Perry Hahn on the East Lincoln holder; we paid Mr. Hahn in three different payments, of $1,000.00, $5,500.00 and $183.27, making a total of $6,683.27, that was all just for the tank work and nothing else on the East Lincoln holder. We were forced by the city to buy that type of a holder, of course, the city didn't draw the plans and specifications but they did specify that we must build a holder with a brick tank in the ground. That was done by the city council and they wouldn't grant the permit only under the condition that we put the tank in the ground, and it didn't make any hit with us either because it cost us a good many thousand more than we wanted to put into that holder.

I was asked to look up our bank balances and tell what our average balances have been in all of our banks, including Doherty
802 & Co., for the period commencing with January 1st up to the present time I have compiled that commencing with January 1st, 1912, up to June 1st of this year, and the total average deposit at the end of each month amounted to $83,930.00 for the period of time specified. I can give the monthly balances in detail during that time in each bank, and I will submit the tabulation showing how I arrived at the average.

We are still looking for the contract covering the East Lincoln holder and in looking for that I discovered the contract for the 7′ 6″ water gas set, dated May 24, 1912, that is the last water gas set installed.

I produce the following exhibits tabulation showing bank balances exhibit "109"; contract for 7′ 6″ water gas outfit exhibit "110"; contract for masonery tank for East Lincoln holder exh-bit "111"; contract for excavation East Lincoln holder exhibit "112"; and specifications for masonery tank East Lincoln holder attached to exhibit "111" being exhibit "111-a."

Cross-examination continued by Mr. Alton D. Adams:

Concerning exhibit "112" whether or not this form of contract was ever actually executed between Mr. Malone and the company, would say that contract does not purport to be an executed contract, it purports to show the price Mr. Malone agreed to excavate that material for and it was the contract under which the work was done. I am aware of the fact that this contract, exhibit "112" doesn't bear the signature of the Lincoln Gas & Electric Company but it was the proposition made by Mr. Malone and signed by him, our signature is not attached to the contract. Concerning whether this proposition was ever in fact accepted by the company, I don't know that we signed a contract which might have been a copy of that one, and gave it to Mr. Malone or not, but that was the
803 proposal under which the work was done.

If we have purchased any meter connections during the past year they have been purchased from Chas. H. Dickey & Co. or the Western Supply Co., or some house that would handle that sort of connections. I don't remember whether it has been our practice to buy a number of meter connections or not. I think it has been our practice during the past year to make up a large number of meter connections. Whether I could produce the bills from either of these concerns for a set of five light meter connections, would say our purchasing agent would be more competent to give that, Mr. Mallatte can answer than better than I can. If we have such a bill, or purchased any five light meters I will certainly produce the bill.

Concerning this exhibit "88" on the first page the quantities there are dollars. Concerning whether the second and third pages of exhibit "88" show the pounds of steam for which the dollars shown on the first page were paid so that the pounds of steam and dollars in the respective months correspond, would say, I don't know whether I can answer than correctly or not, I didn't *not* make up the compilation,—the second sheet in the first column shows the number of pounds of steam evaporated in the electircal department for 1912 and the second column the cost per thousand pounds of water. The third column the gas made in 1912, and the fourth column the pounds of water on the same basis as coal, and that basis has been explained, and the last column the actual number of pounds of water; these pounds of water are those used by the electric department and actually sold in steam to the gas department, the next column shows the number of pounds of coal used in the electrical department and the pounds of coal charged to the gas department and the percentage of electrical coal charged to gas.

What you were trying to discover, as we understand it, was how we arrived at our steam charge in our gas department and
804 that we have submitted, and we have shown in this exhibit the cost of the steam generated in the electric department, we have also shown in the same exhibit the amount of steam that would have been charged to the gas department, using the same basis of computing the steam as we used in determining the coal. Exhibit "88" does show the number of pounds of steam we claim our gas department got from our electric department during the year 1912, it is the column headed "Pounds of water evaporated actual during the year 1912" on the second sheet there. Concerning the price per hundred pounds of steam charged by the electric to the gas department, would say we find as has already been explained, by using the method of charging the steam to the gas works,—this compilation will simply show and give a comparison between what the charge would have been if we had multiplied the total pounds of steam, shown in the column I referred to a moment ago, by the cost per thousand generated in the electric department. Referring to exhibit "88" the column on sheet 2 headed "Water actual" for January, 1912, it appears there he has entered 2,250,000 pounds. The money charged the gas department in exhibit "88" for that 2,250,000 pounds water or steam appears in sheet one in the amount of $860.00. The same item for February was $900.00, and if you will wait just a moment I will tell you just what the cost of that water would have been at the cost of generation in the steam plant which is shown in this exhibit. Now that $860.00 in January has been computed on the basis of 20 pounds of coal per thousand feet of gas and using our cost per pound for coal. Now you ask us to get up this tabulation showing the pounds of water evaporated in the electrical department and the cost of it, and then an estimate of how much steam was used in the gas department and the tabulation shows that now: If I take the pounds of water used in the gas department and multiply it by the cost of evaporating that water in the electric department
805 I would get a comparison between that and our method of charging; if I multiplied 2,250,000 pounds of water or steam by .3829 the cost of evaporating that water in the electric department, we get by the slide rule computation a little over $860.00 and we charge $860.00.

Now taking the next month and using the same column of comparison and multiplying 2,260,000 pounds of water or steam by the cost of evaporating it per pound, which was .3988 we get an amount equal to about $900.00 by the slide rule calculation and we charged them $900.00. The figures I have just given as the cost per pound for generating the steam in the electric department,—it isn't the cost per pound, I should have said per 1,000 pounds. We get at our cost of steam generation approximately from the cost of the coal.

I do not know from recollection when each of the 6′ 6″ water gas set were used to make gas, we compile our station logs and they would show that, that would not be a serious burden to look up and fix the date and I would be glad to do it. It will also state the num-

ber of days that the machine was in use and the amount of gas made. That is in the last month of use, or fraction of a month of use of each of these 6′ 6″ machines, the number of days in use and the gas actually made with it.

The city has all of the tabulation showing the interest paid by the company on construction accounts beginning with 1903 and ending with 1912; I testify that so far as the reports of this company are in, that they are in such form and detail that the interest paid on such construction accounts can be segragated from these reports from other interest paid by going over all of our records, we can get it from our operating reports and you have had access to it all. I am certainly willing to make that compilation. I am also willing to compile all the casualty insurance we have paid
806 during the same period on construction accounts year by year, that is from 1903 to 1912 inclusive.

The company is making all water gas now. It has not made any coal gas during the past six months.

The cost of our coke f. o. b. Lincoln is $7.45 per ton of 2,000 pounds. Mr. Montgomery told me yesterday that our oil is costing $4.635 f. o. b. Lincoln by the car load. We haven't any quotations later than about the first of the year on what we could get gas coal here in Lincoln f. o. b. From my hazy recollection of the price quoted we could have gotten that gas coal for $5.65 or $5.70 f. o. b. Lincoln. It would be a comparatively easy matter to look that up in connection with Youghiougheny coal. I have no tabulation before me showing what it cost to make coal gas, therefore, can not state which is the cheaper at the plant coal or water gas or a combination of the two. I am not so experienced gas operator, and neither are you as to be able to tell right off hand how much it is going to cost to make coal gas. You wouldn't state and neither would I, what the cost would be; I am not going to make any such statement until I have some facts and figures to bear me out. I haven't figured it out what it would cost to make either pure coal gas or pure enriched water gas, I haven't been here for some little time and don't know what it cost us last month and haven't the figures to make a comparison from. I approve the management of the company in making water gas at this time, on the basis that we have found that in the last few years that we could make water gas cheaper than coal gas, we have discovered that first when we were able to buy oil at 2.7 cents per gallon delivered f. o. b. Lincoln. I have just stated what we have discovered, that we could may water gas cheaper than coal gas when the price of gas oil went down, the price stayed down two years and then commenced to rise; we are now buying our oil net on contract with the specifications that we are able to get the benefit of gas oil if the price of crued oil went down; we
807 haven't been able to discover what the price of gas oil is going to be but we don't feel that a sudden change should be made from water gas to coal gas, we are watching the situation and if it should turn out that our price of water gas is going to be so extravagant that the price of water gas is going to be materially increased we shall have to change over to coal gas. I said it was cheaper to

make water gas when the oil was 2.7 cents. The price of gas oil now is 4.63 cents per gallon. I don't remember what the price of coke was at the time the oil was 2.7 cents a gallon exactly, it was about $6.95¢ laid down in Lincoln and is now $7.45. Concerning how much this rise in the price of oil from 2.7 cents to 4.63 cents has added to the cost of making 1,000 feet of enriched water gas, on the basis of 30 gallons per 1,000, that is somewhere near it, we would have an advance in the cost per thousand on oil alone of 6.4 cents. In my opinion the rise in the price of oil would not necessarily increase any of the other expenses of making water gas, except the oil expense,—just the mere rise in the price of oil doesn't increase any expense outside of the cost of the oil for enriching purposes. Concerning how much higher the price of oil would have to go above the figure quoted before I would think it advisable for the company to make coal gas, I would say that would have to be determined by a course of analysis of a good many conditions that I couldn't analyize off hand and don't care to. I know the price at which the Denver coke sells here in Lincoln, we can buy Denver coke ourselves for $6.00 I believe; I think we have been quoted that price, but I don't know that we could get it at that price now, that is on cars, here. It retails to the consumer here in Lincoln at about $8.00 or $8.50 in small quantities; they are not selling a great deal of coke in Lincoln that comes from Denver. There is comparitively no market for coke in Lincoln today. I have no idea, apart from our own consumption of coke, what the annual consumption of coke in
808 tons in Lincoln is, only on a comparitive basis, I make up my opinion on that from the number of wagons I see on the street and a knowledge of the efforts to sell fuel here in town. I have made no investigation, to arrive at any different figures as to the quantity of coke consumed here, but I know something about what the Denver company has sold to the local dealers here in Lincoln, but I don't know where that coke went to. I don't believe they sell here in town a car a month for local use; I have testified that I didn't know the total sales here in town. Whether I have a preference for the Milwaukee coke to the Denver coke we are buying for use, I have no preference for this Milwaukee coke,—or our decision to the Milwaukee coke in preference to the Denver coke was arrived at by careful tests made in our machines, not only once but several times, and we discovered the amount required when using the Denver coke per thousand and the amount of gas we could make in a given time with a given amount of coke our results proved to us that it was cheaper for us to use the Milwaukee long hour coke at a price considerably, in excess of that asked for the Denver coke because of the more economical results obtained. We have not the results of those tests, we threw those all away, but we can get the evidence from our foreman, the man that operated the machine, and Mr. Montgomery, and you can get it from me if you like as to what those results were. Concerning the consumption of those two varieties, the Denver coke and the Milwaukee coke as we found it per 1,000 gas feet made and water gas generated, in the use of the Denver coke it required in the neighborhood of 50 pounds or more per 1,000 cubic feet of gas made

and we also discovered that in the use of that coke we couldn't make as much gas per hour on the machine; we also discovered that we had to take up more time during the day for clinkering on account of the large amount of ash clinkers found in the Denver coke,
809 and although we couldn't discover what the difference was in purification there was some difference, I think there is more sulphur in the Denver coke although that is fairly free from sulphur, but we had no trouble whatever with the long hour coke from Naphthaline or other impurities. It required between 30 and 33 pounds of the Milwaukee coke per thousand cubic feet of gas as shown on our reports. I claim absolutely that fully 50% more in weight of the Denver coke is required to produce 1,000 cubic feet of gas than with the Milwaukee coke. In our practice here of making water gas we have never used anthracite coal in our machines. We have used other coke aside from the Denver and Milwaukee coke, we haven't used coke from other plants but we have made coke here different from anything I testified to and have produced coke that is similar to what you get from Youghiougneny and Kennewan coal. Concerning the coke we produce here in our own benches and the weight of that coke required in our gas generators to make 1,000 cubic feet of water gas would say I don't remember the weight or number of pounds it took per thousand, but I do remember our experience very well; we made here at one time a portion of our coal gas from Kansas coals, and the coke that we got from the Kansas coals was of a very inferior quality and was full of sulphur, so full of sulphur that we couldn't make gas we could turn through our purifying boxes or apparatus in shape to permit them to use it; the coke also absolutely ruined the lining in our water gas generator and also the furnaces in the coal gas benches. The Kansas coal is an entirely different kind from the Youghiougneny or Kennewan coal; it is very much higher in sulphur. When we were making coal gas from Youghiougneny coal we were using in the neighborhood of 40 pounds of coke per thousand and when we used the Kennewan coal it took more coke per 1,000, just how much more I don't know. It will be about a week before I can have these compilations about interest and insurance.

810 Mr. B. C. ADAMS resumed the stand for further cross-examination.

Cross-examination by Mr. Foster:

Referring to exhibit "88" to the item of water $137.89 shown under January it represents expense for water, for the purpose,—I want to get a classification and then I can tell you,—now exhibit "88" shows for the month of January for instance, in account #1100 $350.00, and that is only a portion of the expense as shown for that account. Account #1100 is charged with the proper proportion of the cost of steam as shown by our special account #1809; special account #1809 takes care of, among other things, water which is used for boiler feeding or condensing purposes. Now all of the items in account #1809 are closed monthly into the steam accounts

#1014, 1100, 1110, 1201 and 1210; we show in that exhibit $410.00 in the month of January charged into account #1116, and that comes from special expense account #1815 into which is charged among other things water for general purposes.

Now the item of $137.89 for water covers the water that was used in the big station meter at the works, we have to keep the level constant in that meter and that means that we have to have an overflow and keep the water going through, that is down for the purpose of keeping the meter running accurately, I mean the gas meter, and I might say th-t the purpose of putting water into that building is to take care of that meter but it is being used for other purposes there, shower baths in the basement, and incidental use of water that might be made or used and cast off from that particular meter is charged in this account. There is more than one water meter in the com-
811 pany's plant, but this meter that takes care of this charge of $137.89 is in the purifying house. We have three water meters in the electric and three in the gas department. This amount of $137.89 represents the water used to maintain the level in our gas meter and for general use around the purifying house, which does not include the condensing apparatus, that water don't go through the condenser. Concerning whether my explanation given a moment ago that this is being used for condenser purposes and boiler feed is correct, I would say I showed there the items that would go into accounts #1100 and 1110, but the water that is mentioned here in the amount of $137.89 went into account #1116 and came from special expense account #1815. The purpose of showing the water on exhibit "88" as a part of the steam expense is because you will notcie from the report that we carry a steam account on page 20, #1809 and the accounts shown there are carried into the expense accounts shown on page 11 #1100, 1110 and 1116, and the question has been asked me in such a manner that I have to go back to the general accounts and follow it down and show the analysis of the money that went into the three items I just read off on page 11. Concerning why there is any item of water appearing in this exhibit when it is for other expenses, would say it is because our classification of costs call for that sort of division, we could call the expense account for steam, coal, light or anything else we want to, it is simply an arbitrary division. Whether the steam expense is supposed to include anything that is not used for steam, the account we call steam there in that exhibit "88" in the amount of $860.00 is nothing but steam but that was ch-rged in accounts #1100, 1110 and 1116, and other items are also charged in those three accounts and included electricity and water. You see our account #1116, called works, expense and supplies, includes, from this exhibit, $410.00 for steam, but water also went in there in addition to that as a general expense.

This item of $137.89 for water shown on exhibit "88" went
812 through the meter in the purifying house, and was there for general purposes in the purifying house, that is, incidental. That water was not brought into the plant through any other meter and charged as an operating expense. The water used in the shower baths is used by the laborers in the gas department, there are separate

shower baths for the employees of the other departments, we have a shower bath in the electric plant and steam station. Whether there is any part of the charge for water in any of the meters of the gas plant apportioned between the gas and electric department, there is no apportionment made for that meter, the water is used in the gas department direct and charged to it accordingly; the water used for steam purposes is metered and charged directly to the electric department.

Cross-examination continued by Mr. Morning:

The steam condenser or tower is used in connection with the electric department, we buy a given amount of water to condense our steam with and after we have bought it we try to use it over and over again.

Referring to exhibit "30", our operating report for 1912 item #2300 under the heading "Bituminous gas coal tons, 229.41", that item covered gas coal that we had held over from our coal gas operation which ceased in 1909, I believe it was sometime in the summer. We disposed of that coal to the employees and burned some in the electric plant. Whether there was a shortage in our inventory in coal when we ceased coal gas manufacture, I believe after the coal had all been used up our books still showed a stock on hand. I don't know how much stock was shown at that time. Mr. Phillips can testify to that, he would have to know about it in advance, but he can find out. Concerning how that shortage was handled on our books or charged off, I know it was taken care of in operation,
813 charged to operating expenses by pro rating the shortage over a period, I don't remember how long that period was, Mr. Phillips will know, he can find all of that information.

Redirect examination by Mr. Strode:

Referring to the fact that the price of oil used in the manufacture of water gas, and coke, had gone up from 2.7 cents to 4.65 since about 1910 the increased price of oil and *cole* of course would be reflected in the increased cost of manufacturing the gas. In addition to the fact that the price of materials have gone up, used in the manufacture of gas, since 1909 and 1910 competition by electric current has been such as to affect the sales of gas for illuminating purposes to a very marked degree, ever since the introduction of the carbon lamp it has introduced competition into the field that we have always had difficulty in overcoming. Concerning changes if any, that have taken place in the situation since the close of 1906, with relation to the use of gas and the use of electric current in this city, would say the introduction and use of the Tungstun lamp which made it possible to use current very cheaply has interferred very seriously with the efforts of the gas companies to retain gas customers using the product for illumination. We find now that new houses are very seldom built equipped with gas piping for illumination. The houses are only piped to take care of stoves and water heaters, and have gas that might be used for industrial purposes only; we have felt for a

good many years back that the time was coming when our gas illumination particularly in the residence section, would all get away from us; we have been borne out in our predictions and today we are adding more electric consumers than in our history in a given length of time, although we are not building any more houses in Lincoln than in other years, and although we are not making any
814 more extensions in Lincoln than we have made in years gone by we find that these electric consumers are dispensing with gas illumination in their homes and substituting electricity.

In the last few years we have sold any number of electric irons where previously we couldn't sell any; we find on one of our electric circuits on Tuesdays we have fifty additional kilowatts that we attribute to the ironing load, meaning that we have something over a hundred customers on that circuit that use electric current for ironing on Tuesday and that condition prevails on other circuits, but we have been able to check it up more carefully on that circuit.

We find that people are using electric toasters, *curling* irons, heating pans, milk warmers and other appliances that we handle that interfere with the sale of gas for heating purposes, before their use gas was the substitute.

Our observation here has been and we have had experience in University Place in the last three years as to what we could do with gas for illumination; we went into that town in 1910 with gas and the inhabitants of that town never thought they were going to be able to get gas into the city, consequently none of the house- were piped for gas with the exception of forty, and after three years' effort we have been unable to get any of those people to use gas for illumination, and all of our effort has been entirely along the line of selling for cooking purposes, but we never will be able to get the people there to consume gas for illumination. Since 1906 we have not only practically but absolutely lost that field of operation, and any company that makes any effort for the purpose of acquiring consumers for gas illumination is throwing their money away. It has been proven out by the company I have been connected with during the last month, we have tried and failed and it can't be done,
815 it is lost for good, the Tungston lamp has really cut us out of that field of operation. Back in 1906 we furnished illumination by gas for the stores. At this time the company does that and probably always will in some stores but that field of operation isn't as much as it was and it is getting more difficult every day to keep what we have and get anything addition- at any price, the tendency in the gross revenue of this company has been towards a decrease. That has been due absolutely to the encroachment and use of the electric current supplanting the use of gas, we haven't lost any customers, we have more customers today than we ever had, but we haven't the revenue and we haven't lost any cooking or big industrial appliances. We have the gas in the same number of houses but it is not used for the same purposes or to the same extent, and never will be under any rate. In my opinion I think it would be possible to increase the sale of gas for industrial purposes providing there was a very, very low rate put into effect. To permit

the company to get large industrial users I believe they would have to sell the gas under 50 cents where over 50,000 cubic feet per month of gas was used; that is because of the economy people obtain by using coal ranges long hours in a day where the range or appliance is used a good part of the twenty-four hours if not the twenty-four hours straight through; it can be demonstrated as to how much that service costs by the use of coal. In order to meet that we would have to furnish gas at a rate under 50 cents, and not only that, we are not only competing with coal but installations as they have at the Lincoln Hotel where they use steam tables and appliances that require the use of steam and in that instance the steam is a by-product. the hotel generates its own current and the steam used in generation is distributed through the hotel for heating and cooking purposes and instead of gas, they use steam at a very low cost and to get into that field I doubt if we could touch it at anything like 50 cents.

816 I know of one installation, not here but in another location, where they were burning wood at approximately $6.00 a cord and they used that wood to heat a melting pot, the melting pot had to be kept at 180 degrees 24 hours a day and we substituted gas for the wood, the wood was costing them $6.00 per cord and it was costing them $60.00 per month, we substituted gas for the wood with economical burners and we found at 50 cents per 1000 the gas cost them just exactly twice what they were paying for the wood twice $65.00, that was an actual test and nothing to interfere with the comparison, it was direct.

Concerning whether any engineering expenses were paid out by the company in the construction of this East Lincoln holder, would say that I was asked that if in different installations we had employed engineering assistants, and to that I answered, we had in a very few instances at a very small expense, but I didn't state in answer to the question that we had competent engineering assistants from our New York office in practically every instant w-ere we set up a new apparatus, but in the instance of the East Lincoln holder the New York office suggested what should be the character of the installation from an engineering standpoint, and that we do the work in a certain way. There was no charge made this company for that service under that heading. If we didn't have the benefit of the engineering services and advice of the New York office, in the proper management of this company whether in many instances we would have to secure such services outside, I would say yes, unless we are able to go to some one with broader experience than we can get here, we would have to employ outside help to do justice to the operation of the company and the stockholders interested in it.

Concerning casualty insurance we were carrying and whether there is any limitation on the risks the casualty company carries for the benefit of the company, there is a limit, if I can get the

817 policy I can read it right from it; the policy we are carrying don't cover public liability, or all the liability we might be subjected to, there is a limited liability as to the amount to be paid upon the result of any one accident.

Referring to the amount of bonds outstanding of the company,

I know how many are outstanding. The bonds outstanding that draw 6% are the first mortgage bonds in the amount of $333,000.00, those bonds were extended in 1911, our books still accrue interest on those bonds and our books show the amount of interest accrued is a miscellaneous income of the company so that cancels the interest charge on those bonds, there is no expense attached other than that we have a second mortgage with an authorized issue of $1,500,000.00 of 5% bonds, of the $1,500,000.00 bonds there are but $796,600.00 out as interest bearing bonds that we pay interest on, and of the $796,600.00 we own $29,600.00 and on which the interest is paid to ourselves, the reason for that is when we sold the $500,000.00 of three year notes we put up certain collateral which consisted of all the first mortgage bonds in the amount of $333,000.00 and $400,000.00 of second mortgage bonds, well, we didn't have available $400,000.00 of second mortgage bonds, so we had to buy in the open market some of our bonds to add as collateral, of the $733,000.00 that are non-interest bearing $333,000.00 are held by a trustee to retire the first mortgage bonds and those we could not touch; so as a matter of fact we have outstanding interest bearing bonds in the amount of $767,000.00 in the hands of outsiders; and we have outstanding $500,000.00 in notes, secured by bonds that were retired, out of the proceeds of the notes, in part and all of those securities I have enumerated cover the entire property of this company, both gas and electric; they should be apportioned according to the value of the property. But so far as the interest charge on any of
818 those bonds is concerned it doesn't enter into the earnings of the company as carried in the operating account, has absolutely nothing to do with the reports submitted by Mr. Lea showing the gross earnings of the company and corrected net earnings of the company, he had no interest in those charges.

I now have before me the casualty policy in the New England Casualty Company of Boston, Mass. and condition one "The company's liability for damages on account of an accident resulting in bodily injuries to, or in the death of, one person is limited to $5,000.00, and, subject to the same limit for each person, the company's total liability for damages on account of any accident resulting to bodily injuries to, or in the death of, more than one person is limited to $10,000.00; and in addition to such limits the company will assume and pay all costs and expenses in the trial and defenses in the suits and legal proceedings against the assured."

Condition two reads:

"This policy does not cover loss or expense for injuries or death: (1) caused to any person whose compensation is not included in the pay roll; (2) caused to or by any child under 14 years of age; (3) caused to or by any person employed by the assurred contrary to law; (4) suffered or caused by any person in connection to the making of addition or repairs to, or alterations in, any building, structure or plant, or any part thereof, but ordinary repairs when made by the employees of the assurred whose compensation is included in the estimate set forth in the schedule are permitted."

That is simply a policy covering our operating pay roll such as we have submitted to the insurance company but it might not cover

all of our pay roll even, and then it is under certain limitations and restrictions and doesn't apply to every accident.

The policy exhibit "134" submitted for examination and use by counsel of the city, but not offered in evidence.

With reference to this steam item in the inventories prepared here, and the reports submitted by Mr. Lea thereon, this, company so far as the property which is being valued here in this case has no boilers or boiler rooms or any of the equipment used to manufacture steam. There is no item of property of that kind entered in the real estate, buildings or equipment, either upon the inventory or on Mr. Lea's report. The company has the benefit in the gas
819 department of the steam furnished at their cost without any investment in any property, or anything added to the cost of that steam for the investment of the electric department in that equipment, there is no such charge; so the gas company gets the best of the situation, because the electric department can generate steam very cheaply, and cheaper than the gas department could if it had to install its own steam generating equipment because of the small amount they use. When I have undertaken to compare the cost of this steam I have taken advantage of the fact that the company is manufacturing steam in the electric department, and on account of the large volume for that department, which goes to the gas department. Have added absolutely nothing to naked cost on account of the investment of the company in the equipment to manufacture steam, or for account of any depreciation in that equipment. Whether that price for steam, as a matter of fact, is unreasonably low and results in a saving to the company as compared to what it would be to the gas department had it installed its own equipment for that purpose and maintained a separate plant, would say it was much cheaper than the gas company operating here could generate steam for gas, their investment, if they had to put in a steam plant would be much greater per unit, the cost for generating would be much greater per unit; I know of one plant where the steam expense is twice what the steam expense of this company is, and the out-put of that company is about the same, that company generates its own steam and has no electric plant. That is the Spokane Company.

Recross-examination by Mr. Morning:

Referring again to this bond matter, we have $333,000.00 of first mortgage bonds as to whether they were really paid and left out-
standing to be used as collateral security, would say, tech-
820 nically they were paid off, but actually they were bought. The way we handled them for all intents and purposes they are non-interest bearing, there are no coupons on the bonds. We really own the bonds and if we desire to do so can cancel them when they are released on the pledge contract.

The authorized issue of second mortgage bonds amounts to $1,500,000.00 but of that issue authorized there is $796,600.00 that bear interest and the others have been issued for collateral purposes and not for sale. We have never derived any money from the sale of them, we still have in the hands of the Trustee $333,000.00

second mortgage bonds that he holds to retire the first mortgage bonds, those are in behind the $500,000.00 of three year notes, and we put the first mortgages themselves behind, and in addition $400,000.00 of second mortgage bonds,—that don't include the $333,000.00 held by the Trustee for the retirement of the first mortgage bonds. The amount that represents the actual sale of bonds now of the second mortgage issue would be $796,600.00, those are still outstanding although we own $29,600.00 of them, of course they have to be considered as outstanding although we own them, however the interest is entered as a miscellaneous earning. We are paying interest on those second mortgage bonds to the extent of $786,600.00 less the interest on $29,660.00; so that leaves outstanding interest bearing bonds for all practical purposes of the second mortgage bonds, $767,000.00; so then if we add to that the $500,000.00 in notes recently issued we would have the total interest bearing accounts in the hands of the public, plus probably some small notes held by the banks. That would be $1,268,000.00 interest bearing obligations in addition to such notes as we have in the banks, amounting to $40,000.00 which are interest bearing securities issued against the entire property of the company; the bonds bearing 5%
821 and the notes 6%; we pay 5% on $767,000.00 and 6% on $500,000.00, and in addition to that we are paying 6% on about $40,000.00 borrowed money in the banks and receiving interest on a certain part of our borrowed money, the part we have with Doherty & Co.; that practically offsets the interest charge on notes outstanding in the banks and gives us credit for nothing, and that is the interest bearing obligations substantially of the corporation, which means the corporation embracing the two departments. To apportion that between the two departments, personally if I were the company I should say it should be determined by the relative values of the two properties, I would not say even approximately, what should be charged to each department, I don't know; I don't like to guess at it, I think it would only be a conclusion of the witness.

In a way I made an inventory of the electric department at one time, I don't now remember what it showed, to compare it to the inventory of the gas department I would have to make my own inventory of the gas department to get a comparison between them, I have never made that. The company has never made an inventory for showing its book value of the properties for making its report to the New York office. Have never made an inventory in our balance sheets of our electric property. The only reason we didn't apportion the bond interest to the two departments is because we didn't know what the relative values were to determine. We were able to apportion it for the purpose of assigning to the gas department what part we think the gas department should bear of the expenses, but based on some other ground than physical value. I don't remember of any instance where we based it on physical value, although I think Mr. Lea did base it on the physical value and on the amount of ground it was supposed to use for the purpose of getting at the amount of property used in the gas department, that was simply a

question of measuring a small amount of property, but we
822 never have done it in making any of our reports. I made out a very crude inventory of the electric department, I wanted to know something of what we had in a general way; that was three or four years ago; only made just for the electric department, I don't know whether I have that in my note book or not; I could say that I remember in that inventory we made no inventory on the part of the distribution system except to guess at it. I wouldn't say that was gotten up with any great accuracy I came as near as I felt the items I used would warrent. Whether I could say what that was, subject to a revision, would say that I haven't those notes in this book, they are in a smalled book that I haven't with me, my recollection is that I had something over $100,000.00, either $100,000.00 or $125,000.00, in the distribution system, and $400,000.00 or $500,000.00 in the plant, I don't know which it was $400,000.00 or $500,000.00, I don't remember, I may be able — find something around here before I get away, If so I will produce it. That would make then as I recollect it, the total valuation of the electrical department of something like $500,000.00 to $525,000.00, between $500,000.00 and $600,000.00 for the physical value without including any going value or anything of that sort, and not taking into account the depreciation, the working capital, that is for the reproduction as if it were new but that was some three years ago.

Concerning the second mortgage bonds we bought $29,600.00 of them on the market for collateral purposes. We paid for them $77.00 per $100.00 or par value, that was at the time those notes were issued two years ago. The bond interest of course, doesn't show in the operating report at all. Concerning whether it would — any bearing on the question of explaining at least why we didn't pay dividends, would say it explains the disposition of our money simply.

823 The plant I referred to as furnishing its own steam at a larger expense than this company was the Spokane Company. They are generating coal gas there. They generate steam to drive the blowers, exhausters and heating purposes, they use some steam, probably in such quantity this plant does in making water gas for the reason they put more gas than we do and under larger pressure. The expense of their steam has been about $1500.00 per month, but they are trying no/ to abandon the steam plant to as large an extent as possible and are now buying electric current in so doing have been able to save about $600.00 per month. The steam is used for running the exhausters, blowers and for the Doherty economizer outfit; that is similar to the one we have down here in connection with our coal gas plant, something to aid in breaking up the clinkers in the furnaces of the coal gas benches. In making a comparison I am comparing the coal gas plant with the water gas plant. Of course this property is using steam in its water gas generation and that one has no such use, but that would be offset by the excess steam they use for driving their pumps and blowers Out there they use coke for fuel to make steam, at $3.30 per ton. They make the coke, their coke comes from their coal gas operation. The way I figure the coke

cost $3.30 a ton, that is the plant price, we receive more than that out there for coke, we will receive nearer $7.00 per ton. With that $3.30, and the expense of hauling is enormous and the loss in stock due to wasting away we don't figure we have been netting much more than $3.30 at the plant.

824 Redirect examination by Mr. Strode:

Concerning the question of rent we were paying in our former location, within a half a block of our present location, our lease expired December 1912 and we gave it up in February 1912. I know we couldn't continue there under the same rental, the landlord told me we would have to pay for the lower floor $275.00 a month which was $150.00 more than we were paying, and our total rental in that location would have amounted to $450.00 and our steam heat and light amounted to more there than here, in this building for instance, our cost of steam heat in 1911 for October to June a period of eight months was $412.24; for the year 1911 that was, we went into the new building in February 1912 and for the period from October 1912 to June 1913 our steam heat cost $216.79 as against $412.24 in the other place but a part of this period that I have read off here was counted off in the old building, but even at that you can see what a saving we made in the steam heat; and there were other savings that we took into consideration in coming over here, we had a much better arrangement, it is easier to handle things out of our store room, etc, it does take the time to get things out and put them back, everything is very convenient.

Recross-examination by Mr. Morning:

Concerning whether we manage to lose as much on our appliance business over there as here, we managed to increase our appliance sales here. (Querry and therefore increased the loss. (not answered.)

825 Mr. B. C. ADAMS, recalled for further cross examination.

Cross-examination by Mr. Morning:

Concerning exhibit "150" on the question of fire insurance on our property and whether we carry any fire insurance on our buildings. would say, we don't carry any insurance on our gas buildings, therefore, insurance here is carried here at a rate of .7678 under a general form which is attached to each policy and that form provides for a certain amount of insurance on the electric station plant building and a certain amount on the boilers and pumps in that building and in the boiler house and a certain amount on dynamos and electrical apparatus and in addition to the fire insurance carried under the general form we carry insurance on our office furniture and fixtures. and on our stocks; by stocks I mean such as gas stoves, meters and whatever we might have in our store room and in the plant; we also carry insurance on our barnes and sheds, horses and wagons, harness and feed; we carry in addition to the items I have already men-

tioned cyclone insurance on the 500,000.00 cubic foot holder at the plant and that policy is a five year policy expiring in 1914; then we carry insurance on our electric truck and on the Waverly roadster; and insurance on our building at 33rd and "X", the premium on the policies carried under the general form is divided between the gas and electric departments although we are not carrying any of that on the gas department but are taking 10% of the premium and charging it to gas operation, and we are then taking 80% of the balance of the items appearing on the first page of exhibit "150", we charge 80% of the insurance carried on the bar, sheds, horses, wagons, harnesses and feed, to gas.

All of the premium paid on the cyclone insurance policy is
826 charged to the gas department, and 80% of the premium on the Waverly roadster and all of the insurance covering the building at 33rd & "X"; the premium shown here covers a three year policy, so there is only one third of that, and to the $215.00 which Mr. Phillips testified to this morning, I think should be added 80% of $35.00, if that were added to the $215.00 that addition for insurance distributed according to what the insurance is carried on,—our division has been arbitrary,—but according to the figures on this exhibit we find we are close to it. I remember that Mr. Phillips and I in looking over the way we are handling that found that our percentage of premiums was coming close enough to avoid bookkeeping. As far as the property common to both departments the insurance is apportioned 80% to gas and 20% to electric, some of that is all electric as I have testified, but If we were to make the actual division according to the policies we think we should charge more than we have been charging to the gas department. Where it is all electricity we did not divide it 80% and 20%.

Cross-examination by Mr. Foster:

Concerning the $108,000.00 of bills payable taken up by the proceeds of the sale of the $500,000.00 of notes represented in betterments and extensions and shown in exhibit "151" primarily, or secondarily rather, the $108,000.00 shown on the report to the railway commission referred to the taking up of certain notes and obligations carried by Doherty & Co.; the obligations there incurred represented money that was required by the property in making the extensions and improvements; The construction of this company has been taken care of out of the earnings and money borrowed on short time paper for a great many years, the company hasn't sold any bonds since they sold their second mortgage bonds. Consequently
827 we had to depend upon our own resources and that of our eastern office and the 108,000.00 could be distributed over specific construction items, but I can't say whether $100,000.00 out of the $108,000.00 represented so *am*ny feet of pipe laid in N Street or some other part of the territory, and I can't say that a dollar with the date of 1889 on it was used to carry on that work or that a dollar with a date of 1900 was taken out of our earnings over and above operating expenses, but we can show that there has been construction

that will more than amount to the amount of money represented by the $108,000.00.

Concerning whether the $108,000.00 represents betterments and extensions of the electric department as well as the gas department I could answer that to suit my own convenience, perhaps we have spent so much money in the two departments, I could say the $108,000.00 represented electric and gas improvements, because we have spent more than that amount in either department to cover additions and improvements. I would not say that the $108,000.00 represents all the money borrowed to make extensions and improvements since 1907. It is a difficult question to answer off hand concerning what portion of betterments and extensions were taken care of by borrowed money from 1907 to 1912 inclusive, in the first place it is an unintelligible proposition, the only answer that I can give you that is intelligent is the fact that we have in our construction accounts more money represented than we have borrowed and whatever has been taken out of our earnings over and above the actual amount of operating expenses, and the amount of money we have had to pay for interest charges (interrupted,—whether the $108,000.00 all the borrowed money that has gone into extensions, or money derived from the sale of stock, I didn't testify to that at all. We may have borrowed money that we have paid off. The reports all show
828 that, I can't answer that off hand. If we paid off those debts we got that out of the earnings over and above interest charges and operating expenses. I didn't say that would still be just $108,000.00, to account for it we may have borrowed it from the bank and at the time this report was made we only had $108,000.00 to account for in notes on that basis. Concerning what other borrowed money we have used in that period from 1907 to 1912 would say, as the testimony shows we have issued notes to several construction companies and paid those notes off with perhaps other borrowed money and other sources of money derived from the operation of the property and I can't testify off hand without going through the reports and making a compilation as to what the items might be.

Concerning the net results and getting at how much betterments and extensions are represented by the borrowed money and how much by the earnings, just as many times as you repeat that question I will answer it in the form I have been answering; I can't answer it off hand, my memory is not specific enough to dig out those items, we have undoubtedly used more borrowed money than is represented by the $108,000.00 in this exhibit but if we have, it has either been paid out of the earnings of the property or in some other manner. Concerning whether the $108,000.00 is all that is outstanding now except whatever other accounts payable may be outstanding at this time. would answer in a way yes, but the $108,000.00 don't represent the amount of money we borrowed from banks here in town at the time this report was made, that amounted to $40,000.00 and was not paid off.

829 Cross-examination by Mr. Morning continued:

Concerning exhibit "155" relating to the use of the 6′ 6″ water gas set with the notation run from June 30th 1910 to August 29th 1910 and in parenthesis "flood run alone", we had a flood down there that drowned out all of our machinery, that was the first machine started as I remember and is accounted for as I remember that we didn't think we could get the gas from the new machines into the relief holder and thought we could get it from that machine possibly, on account of the pipes being full of water, that was the flood of 1910, and my recollection concerning why that was run alone is that we were repairing the 7′ 6″ machine before the other set was ready. Then again the notation "run mornings from June 30th 1912 to August 31st 1912, with old 7′ 6″ part of the time every day and part of the time *v*eery other day before starting the new machines", that was the time we were putting in the last machine installed. The Springer set was run on and off during the month of July 1909, I presume I could give the dates by looking up the reports, the first items mentioned concerned the 6′ 6″ water gas set, the reason we had to run it in conjunction with the 6′ 6″ set was to make up the amount of gas required by the city. As far as the piping on the machine is concerned it is connected up for making gas now, the motor for the blower is not on the ground next to the machine but is on the property and stands ready to be used there at any moment, it would probably take an hour to connect it up, it has to be transferred over to this place.

In speaking of floods in these annual reports are several items called flood, 1908 $100.00, 1909 $300.00, 1910 $300.00, 1911 $378.00, that does not mean we had a flood in each of those years, it means that at the time of the flood there were expenses in-
830 curred that were entirely due to the flood itself and rather than charge that amount to the expense of any one month or year we pro rated it over several years, so as to make the account as normal as possible, the flood occurred in 1908 and the total expense was $1078.00. Whether that ground down there where the plant is is subject to overflow, it was at that time we thought it was due to the grading done on the railroad largely in view of the fact that that was the first flood that had occurred down there in a period of forty years, and we haven't been threatoned since because they straightened out Salt Creek channel. I say that is the first flood meaning the first one that was disastrous to us.

Concerning the item in exhibit "155" from June 30th 1910 to August 29, 1910 which says flood would say that I am confused then in the floods there, there was a flood there in 1908 and I have never seen another like it, the 1908 flood stood three feet and six inches on our electric station floor which is the high mark period in forty years, it put our entire property out of commission, it stood as high as the B. & M. Depot and was the first time it had ever gotten over our electric station floor. Concerning whether we had a flood in 1910 because the word is used in connection with the 6′ 6″ machine that is probably due to the fact that we couldn't get coke over the new set or some such a reason.

Concerning the item #1110 in the operating reports headed steam and also an item at #1100 steam for generating water gas would say that was thoroughly set out in the evidence submitted in the early part of last week in detail, the steam in #1100 is used in the generator for the purpose of making C. O. gas, the steam is decomposed as it enters the water gas generator, into hydrogen and oxygen, the oxygen unit-s with the carbon in the coke and makes the C. O. gas of about 300 or 360 B. T. U. per cubic foot, that gas has no
831 illuminating power. Now the steam in item #1110 was used for steam heating of the buildings and perhaps some power purposes and that was explained in the evidence before. In 1907 entered in our account #1110 is steam $880.78, the next year we have $2421.07 and the amount keeps up in that neighborhood practically until 1912 when it doubles and reaches $4889.59 the reason why that item used for power and heating purposes increased between those years is, that in the early years specified we were operating the coal gas plant, that plant was still operated in 1907, up to that period we were operating twelve benches of 6's and from that time on we commenced to cut down the number of coal gas benches operated, at times only operated three benches while the other three were being rebuilt, so the amount of water gas being generated varied. As it varied necessarily the steam expenses and account #1110 also varied, because in making water gas it is necessary to blow air through the generator for the purpose of heating the coke to the point of incandescence and the amount of power required is proportioned to the time the machine is in operation, the blower has either steam or electric power but in any event the expense would go in there even though the electric motor was used, it was steam expense. The blower is used in connection with the water gas generator itself, the bellows fans the fire in the steam generator to get into a state of incandescence and the steam is in there about the same length of time as we blow the air, we alternate the steam goes under a given pressure and you get about the same amount through in a given length of time for the operation then we blow with a fifty horse power steam turbine for about the same length of time that the steam is going under the grate; a 50 horse power engine is small, but small engines require a large amount of steam per horse power, I would say the one we are using require 72 pounds per horse power. I think that is the item that accounts for the difference in the years, as a general
832 proposition the amount of steam required is proportional to the amount of gas generated.

Concerning the increase in cost on this item of steam from $880.70 to $4500.00, there might be several reason, I think we have already shown in our testimony that we have at times varied the method of charging steam, I am sure of it for the earlier years prior to 1907. there was no accurate way of determining the proportion, then again we have changed our blowing equipment at times, the machine installed in 1911 probably is the most economical of the various sized sets, we found we could blow on the new set for the same length of time we were blowing on the old set and making considerable more gas explaining the increase from $3300.00 in round numbers in 1911

up to $4800.00 in 1912 we found in 1911 we could operate our water gas machine at the blast pressure of 22 inches of water and do it very economically but had a very disasterous experience, absolutely wrecked our blower on two different occasions that year, and finally upon the advice of the manufacturers and our own engineers conclude- we had better cut down our blast pressure and are now operating from 16 to 18 inches instead of 22 and our blast is considerably longer but we are not getting as efficient results as in 1911 and 1912. In a greater ratio of power that the various pressures would indicate, that is it would take more power to blast against 22 inches than against 16 or 18 inches, we use more steam for that purpose than we did in 1911 and 1912 because it takes a longer blast and we don't make as much; I don't say that fact would account for all of the difference between $3300.00 and $4800.00, from our experience in operating those machines it would certainly account for a considerable amount of it, and because we raised the price of steam we were paying to the electric department that item certainly would enter into it.

833 Concerning the fact of that being an arbitrary method and what there would be to prevent us from raising the price so high for steam as to upset any rate the city authorities might establish would say if we were so simple minded as to think we could consum-ate a system of bookkeeping designed to deceive the city we would have gone to pieces a long while ago; we don't deny that it is possible, it always has been possible ever since the suit was started to make arbitrary charges, as far as rates are concerned, to the gas department but you will find we never have adopted any such notion, we have tried to make such charges as to give our actual operating expenses in each department, their proper proportion; even if we had a notion that we could cheat the city we had no assurance that certain intervenors would not have come in and tried to reduce our electric rate. The city authorities haven't started in on that yet but we have a competitor; anyhow the steam items in #1100 and #1110 is fixed by ourselves, we charge a department that is involved in this litigation with a price, for steam, that is fixed by ourselves and credit it to the electric department which isn't involved in this litigation. The rule for fixing that price is arbitrary in the manner that we can arrive at it at the same time the engineering facts by which we do arrive at it are the logical conclusion. In determining how much steam was used for so many thousand feet of gas made that was done by introducing in this hearing evidence that was based primarily on the operating of the boilers in the electric plant for the purpose of operating the gas plant and also running motors on certain apparatus in the gas plant and taking the consumption of those motors to determine the amount of power required and by that we could actually determine the amount of steam required.

Going the item #1117 general supervision, we charge this account with the proper proportion of the cost of general supervision as shown by account #1816, and account #1816 says to charge

834 this account with the salaries of the superintend- of works, works foreman and all clerical help on records and accounts

pertaining to the manufacturing department, whether at the general office or the works, works draftsman, premium on surety bonds and all works employees. That is the works foreman and these other items I read pertain to line #1816. I just read what would go into account #1117 in the manner in which it would come from account #1816. The reason for the change in amounts in account #1117 for those various years is largely accounted for by the fact that the general account #1816 is divided according to the amount of coal gas and water gas manufactured, so where we were making all water gas all money charged into account #1816 would come back into #1117 under the water gas account, but if we had been making coal gas that amount would have been apportion- between accounts #1117 and #1021, in the proportion we were making it. if half and half half would go to each or if 20% and 80% it would go in that proportion, so those accounts have changed from year to year. In 1907, 1908 and part of 1909 we were making both coal and water gas, and apportioned that between those accounts; and when in 1910 the element of coal gas was eliminated and we were making only water gas then it all went into the one account.

Take the year 1912 the item of general supervision the increase of salaries and the increase in the number of men both affected the supervision with the increase of out-put.

Concerning what there is about the increase in amount of dollars from 1910 to 1912 in general supervision that requires an increased cost when the out-put is increased, would say you don't put it right. we have been paying in recent years more money to our superintendents than in earlier years, when I first came here I was,—and I boasted of it,—a college graduate and I was paid a very small salary. the men under me at that time were most all just out of college really working at workman's wages rather than amounts paid to
835 men of experience, but as time has gone on getting more money, and we found we had to pay more money in later than in earlier years, men demanded more money and if we want good men we have to pay the price, I think that is an unusually small increase. We actually did increase the salaries of the men involved in this item in 1910, and made an increase in 1911 on the same item and we have increased from paying our superintendent in 1906 $100.00 a month to $200.00 a month. I don't remember what the advance in his salary was from 1910 to 1911 but it has increased from $100.00 per month in 1906 to $200.00 at the present time, and the works foreman and other men have gone with it, such items that enter into this general account that says it should take care of the works foreman, etc. We have absolutely raised all of the salaries in the clerical department since 1906, no one can get clerical help since then at the old salaries.

Concerning line #1000 coal carbonized for the years 1906, 1907, 1908 and part of 1909 which in the respective years, omitting the fraction and giving it in round numbers for 1906 was 7579 tons of coal carbonized; 1907 7098 tons; 1908, 5565 tons, 1909, 1975 tons making the labor cost in 1906 .632 for 1907, .804 assuming those figures to be correct and the reason it cost more to make coal gas in

1907 than in 1906 I would say that the cost at our plant is largely determined as to labor by the method we have to pursue in getting our coal from the stock to the retorts, this account says charge as used from stock account at the rate of cost in shed including the cost per ton of expense as shown by expense account #1800 which account says: "charge with labor, weighing, unloading, piling and trimming coal in shed, or in unload coal from car or boats, including cost of operating hoisting apparatus. Include cost of shovels, etc., used in handling coal and repairs to same, also insurance on coal in store and on coal sheds and apparatus, and material making repairs to coal sheds."

836 The item there that was always big and variable was the labor item in getting the coal on the pile and then off, and you can readily see that where we were unloading from the cars into the shed where the retorts were we have an enormously large expense compared with what it would cost to unload it into stock and take it back into the retort house, sometimes we are able to unload almost continuously from the cars into the retorts and there is no necessity of piling it into the yard and carting it back on account of shipping arrangements. Whether that explains the increase between 1906 and 1907, I don't know what the situation was, I can only tell what the items were and my report here shows it was the difference between $43,033.89 and $42,844.46. In line 1000 for 1906 as the total cost of carbonizing coal I have $43,033.89 or about $1000.00 difference for 500 tons of coal; for the same item for 1907 I have $42,844.46.

Going to line 1010 retort house labor which line includes certain items of labor cost and making a comparison between these years on the same line for 1906 on line 1000 tons coal carbonized 7579 and a fraction, and the labor cost on that in line 1010 retort house labor $4790.97; taking the same item for 1907 7098 tons coal carbonized and the retort house labor $5708.18; and in 1908 tons carbonized 5565 and the cost of retort house labor $5167.00 assuming that to be the correct amount resulting reduced to the cost of retort house labor per ton carbonized is in 1906 .632; 1907 .804; 1908 .928 explaining why the increase for labor during those years would say account #1010 includes the labor of all descriptions from coal in bin or [illegible] in the retort house to coke leaving the retort house and did i[illegible]l these years, and those items would vary it was for us to get it, the only thing I can think of off hand that would give that difference would be the fact that as time went on our retorts became older and we couldn't charge them with as much coal per retort, conse-

837 quently our expenses would go up because we wouldn't be able to reduce the number of men and in order to make a detailed analysis of that I would have to go through the reports. It might have been more difficult to get the coal to the retorts in one of those years than in another. Then there is the question of the amount of coal that would carbonize per man retort, if we have the same plant and the same number of men and can't carbonized the same number of tons in 24 hours our expense would go up per ton. Then we have also in account #1000 the cost of the coal itself and I think too, if we were to go back we would discover that we bought other coal than

Youhougneny, I think we bought a lot of Virginia coal that didn't give us the yield, that would make a difference on the labor cost per ton, but to get right down to the complete analysis I would have to go to the time cards and get the amount of labor used there, that item of expense has not only been increasing since 1906, but ever since 1900, 1901, 1902 or 1903, if you were to draw a curve showing the general tendency of that item for labor you would find it was upward just as all other items were upward. You have got the whole situation, and when you commence to twist it for the purpose of confusion you are going to get into trouble. You can get the tons of coal by stock adjustment, by stock adjustment I mean, we find that we have charged up so many tons of coal to coal carbonized and when our stock is down so that we can measure it we find we have either more or less stock as shown by our estimates than we should have, we may have clear ground and a lot left, or the other way, and these stock adjustments are made every time we take an inventory, but they wouldn't show them, they show the amount of coal charged to coal carbonized month by month the way we get it in, as our men take the coal from the cars to the retorts, and again the coal that is given on the bill and the coal that is in, and the coal that is left to determine then the amount of stock left from a measurement
838 of the pile. We don't check back against the coal we bought and the coal that went to the retort and the coal we have on hand except at the end of the year, then we have to make an auditor's adjustment to take care of the stock one way or the other. That adjustment shows in these reports certainly, concerning whether they are correct, would say, when you take into account stock adjustment, but you start in with 1906 and say here is so many tons of coal for that year and you should have made a stock adjustment which we have carried out on the next year, these reports show the adjustment but they are all a year behind; when they take a ton of coal into the retort house they don't measure that ton of coal and take it in, they unload it on the ground and take it as they need it, and don't know how much they have used until they have taken an inventory of what they have left.

Now coming to the heading "distribution expenses", and especially to line #1306 gratuitous work which in 1908 is charged at $1376.36; item #1306 takes care of the labor and material required for general complaints in clearing out, changing or adjusting house pipes, gas fixtures, burners or any portion of the consumer's property beyond the meter; investigating the reports of poor service, or large bills, including taking pressure on complaints; labor placing clock meters and changing meters for request tests, and including inspecting and testing new piping, including car fares for inspectors on such work.

Now in 1908 that item was $1376.36, in 1909 it was $2297.17 in 1910 it was $2658.62; in 1911 it was $2904.17 and in 1912 it was $3274.13 that item seems to have increased; now taking a concrete case supposing a meter is complained of and there is a leak about the meter at a consumer's home, we send out some service man, it might be any one in the service department, he is on the regular pay roll but almost always has other duties to preform than would be included

in this item of gratuitous work, it might be only an incident
839 to his main work and it might be all of his duties, assuming that he would go and be gone an hour and comes back to his regular duties, to handle that hour and get it into this account he would charge it on his time card, each man is responsible for turning in his time card and he tells on his card what he has been doing during each hour, sometimes it goes further than that, each fifteen minutes. We have a time card showing on the top what department a man is working in, after it is filled out it shows the kind of work the hours, the rate, and we put in the account number, (producing a blank) suppose I were in that particular department, to illustrate, and were sent out to fix a meter that would probably be a service complaint and I would fill out this blank and probably put that in, and my rate per hour, that is made out and goes to the gas foreman and then to the pay roll clerk who would put in the account number, the man puts in what he did and the time and the foreman signs it and turns it in, he has one for each man and the distribution is made to the different accounts from these cards. This gratuitous work then is the work practically in taking care of customers and is determined largely by the number of customers we have; they have been increasing right along if you will go back ten years you will find that our cost per thousand is fairly uniform, that is all shown in Mr. Lea's report. We figured those units on the 1000 foot basis. I might say there, as a part explanation for the increase in 1911 and 1912 over 1910, that we have had some fairly severe winters in recent years and the winter of 1911 we probably had more complaints than in a good many years, on account of complaints originating from freeze up of some kind.

Concerning the item in line #1114 in the 1911 report, which is general apparatus repairs, expenditures for that year amounting to $5,000.46 which seemed to be in excess to the years previous and following I can't say off hand but there is an abnormal charge
840 there for something, I can get that from the books.

Now going to the general expenses in line #1509, that is made up of executive salaries, general clerical expenses, general office expenses, incidental expenses, rent of executive offices, legal expenses, new business expenses and taxes. In line #1500 are included salaries of the president, vice president, secretary, treasurer, auditor, general manager, and all other officers whose jurisdiction extends over the entire business, including fees or salaries, also fees of transfer agents, registrars of stock and bonds, and fiscal agents. I have the reports here for 1906 and 1907, the general executive salaries for the years 1906 to 1912 inclusive in line #1500 were: 1906, $2804.70; 1907, $3215.52; 1908, $5001.41; 1909 $6113.06; 1910 $9806.31; 1911 $9454.17; 1912 $8917.30.

I don't believe I could tell off hand the salaries of all the different officials, giving their respective salaries in 1912, that are entered in that account; I think I testified at one time as to the salaries of the various officiers, I remember some of them. As to what occasioned the increase from 1906 from $2804.70 up as high as $9454.17 in 1911 would say, in 1906, or about that time, the general manager

was getting $100.00 a month, at that time it wasn't possible for the company to get enough money to meet its pay roll. At that time the president was getting the same has he is now $250.00 a month I think. The chairman of the board of directors didn't get a salary at that time, he was also president of the company, in 1906, and the salary of $3000.00 per year covered both of those positions. I think in 1909 or 1910 we found it necessary to make another office and added $2500.00 for that expense, it was three or four years nearly after this dollar gas litigation started, in 1907 it was $2804.70 gradually increasing until 1911 when it reached $9454.17 and then drops back in 1912 to $8917.30 that was because they did
841 away with the salary of the vice president, up to that time Frank Frueauff the vice president got the salary a part of the time, of $250.00 a month; that is the Frueauff who testified here who is now the president; he was promoted from vice president to president and took his salary with him and then they made me vice president for nothing. Back in 1906 we were paying the secretary $90.00 a month, now we pay him $150.00, and as I said they paid the manager somewhere around $100.00 and then in 1912 they paid him $300.00 a month, all in the face of this confiscatory rate and with a disposition on the part of those working for those salaries to quit.

Explaining the general clerical salaries at line #1501 included in that are salaries and wages of all clerks connected with the general office, except such as may be directly engaged in appliance and other special departments, salaries of clerks connected with manufacturing, distribution or collection department offices to be charged to those departments all clerks connected with the general office. In that was entered for 1906 $493.62; 1907 $394.80; in 1908 $513.00 in 1909 $748.00 in 1910 $804.40; in 1911 $1066.85; 1912 $1209.05, those salaries are apportioned between the two departments, as also are the executive salaries at line #1500, on the basis of 80% to gas and 20% to electric.

Going to line #1504, rent of executive offices, that includes rent paid for executive offices, including proper proportion of expense, for light, heat and janitor services, we call that part of the office down stairs in this building, general executive offices to which we apportioned the rent. We try to arrive at it apportioned to the floor space occupied. We apply eleven divisions to our total rent; the items in each division for 1912 as an illustration as shown by line #1504 is explained as follows; the amount in each division and the corrected total rent was $559.54 for July 1912 up as follows:
842 1304B $50.36; 1403 $55.95; 1504 $111.91; 3215 $27.98; 3227 $27.98; 3931H $27.98; 3264H $11.19; 3293A $5.59; 1804B $50.36; 1819D $111.91; 1819H $55.95; 1820H $22.38, giving a total of $559.54 the rent for July 1912. The items for July 1912 in the amount of $559.54 is made up as follows: John Bernstein, window cleaning $8.00; Lincoln Water Works Department $11.62; Anna Tuttle, rent of shop $40.00; John Bernstein window cleaning $8.00; Chapin Bros. $450.00; Ben Holman rent Havelock office $6.50; Lincoln Gas & Electric contingent $1.00; pay roll janitor $52.42, there are some small items that are not strictly rent

but contingent upon our having to be in the same office and there is a credit to that of $20.00; there is no item there intended to cover payment of rent to the New York office.

Turning to line #1503, incidental expenses, that item covers the cost of publishing annual reports in newspapers, advertising notices of stockholders meetings, dividend notices and other corporation and financial notices of a general chara-ter; traveling expenses of general officers and others connected with the general office, association dues and expenses attending meetings, newspapers and periodicals, and contingent expenses of management, not otherwise provided for. Items advertising the promotion of gas are not included in that item, it is not of that character. That item includes semi-official or official notices. Tracing that account #1503 from 1906 to 1912 inclusive we have the following; 1906 $2137.77; 1907 $1723.38; 1908 $2679.81; 1909 $3715.44; 1910 $2878.32; 1911 $5162.84; 1912 $4775.01. Explaining the increase of that item since 1906 the Accounts Payable Journal shows each and every item that went into those years under that account, I can read that but I can't remember it off hand. In a general way the growth of the business, largely has caused that increase. I remember one item in there in 1911 covering the cost of the compromise we attempted to effect
843 with the city on this very suit. That expense is shown in the journal, I think it was between $1000.00 and $1400.00. We attempted to compromise, we offered to compromise providing 75% of the users would waive their right to any difference that might have accrued between the $1.00 and the $1.20 rate in consideration that we would put $1.00 gas into effect; that was in 1910 but we charged it out in 1911. We sent out solicitors to get the consumers to waive their claims for the difference between the $1.20 and the $1.00 rate in consideration of our putting $1.00 gas into effect if we could get 75% of them to waive. The money spent in that was spent in attempting to get signatures, some advertising, and literature, that was carried in the 1911 account and probably explains why that was the highest year.

Then in 1912 the item is still, that is the sum total of all the items under that heading for 1912 was still $4775.01, explaining that under line number 1503 in the 1912 report the first item under date of January 5th Charity Organization $20.00, the item "W. I. Jones expense account, see Jones's death" that covers the expense of getting the father and mother of a man named Jones to the funeral, Jones was one of our employees who died.

The item under date of January 31st "B. C. Adams expense $40.00 was 80% of the expense money I drew every month, the Gas Company allowed me $50.00 for expenses whether I spent more than that or not, that was in addition to my salary; my salary was on the basis of $3600.00 per year, $600.00 on top of that would make it $4200.00; that covered incidental items of expense that I might be put to not on my own account but of the company, such as lunches and various items, covering entertainment of those who came through here or that I came in contact with. It is a fact that I have been getting $4200.00 per year and have been paying out of that

some expenses the company should stand and for which I was
844 paid $50.00 a month. That practice has been in vogue ever since I became manager, prior to that time the manager was allowed to turn in his expenses and the New York office thought the cheapest way was to put a man on a kind of expense and I thought so myself, if I turned in the expense items it would have run more than that. That has been running on that basis since about 1909; none of our employees are allowed an expense account.

Under date of January 31st the item "contingent $52.65" probably means traveling expenses, and was cash drawn out of the drawer and a receipt put in the cash drawer and a check drawn to cover it; I might go to New York and my receipt would be in the drawer and when I came back we would clear up the drawer by paying the check, it would be a contingent item until that was cleared up.

Under the same date the item "Lincoln Gas & Electric Co. rebates $51.40" means adjustments on accounts, rebates on bills here, complaints, or something; adjustment of somebody's bill.

The item "Lincoln Commercial Club dues, $12.92" represents dues of those in the company who belong to the Commercial Club, the company pays the dues in the Commercial Club of the members of the company; they never got as far as paying for our church subscriptions and lodges; the company pays my membership in the Club; the company pays the Club dues for Mr. Doherty, Mr. Montgomery, myself and Mr. Schuff four of us. The regular dues are $14.00 per year and four times $14.00 would be the sum total of what the company pays for dues just — much as anything would represent a donation, incidentally not to help the Commercial Club line up for the company I think there isn't a member outside of the secretary of the Club that knows a thing about it. You will find several items like the one "Savoy Hotel Cafe $11.32 January 31st" because the heads of departments go there to lunch every Monday
noon they charge the hotel bill to the gas consumers and run
845 it into that account. The item "B. C. Adams February expense" that is the same old friend we had a moment ago.

Under date of February 29th "B. C. Adams's expense managers meetings New York, $280.00" that was spent in going down and back and staying there on the job; that $50.00 didn't reach it, I don't remember how long I stayed there but long enough to sink $280.00 I don't think that was going strong I think I let them off easy by coming back. February "Savoy Hotel $20.92" is one of the items I spoke of where the heads of departments lunch there. None of these men get these executive salaries, just myself. November 30th "Nick Arrigo $2.00 cigars" I think that was occasioned by the legal department of the Municipality, I think that was bought about the time we were having that election. I don't think some one had one on me and I had to set them up. The item "Henry L. Doherty & Co. expense of Winans $18.23" that is the auditor. Under date of March 30th "Lincoln Commercial Club dues $50.68" that is a subscription they got out of us I think, sometime back we had a standing subscription to the Commercial Club in addition to the due- of the members of $200.00 per year, but we quit that, I think we were

asked to subscribe $400.00 and I talked them out of $200.00; I think we carried that two or three years. We haven't any subscription now but they send the bills right along. We stopped payment on that in 1912 and didn't pay anything in 1913. March 30th "Savoy Hotel Cafe $14.90" that is our old friend again the heads of the departments taking lunches at the consumers' expense. "Frank D. Eager April 13th 1912 donation $40.00," that is for these cluster lights down the street operated by the city, I didn't say we wanted it, they wanted $40.00 and everybody else paid it and it was one of those affairs that it is very difficult for a corporation to get out of. I told — I thought we ought to light the lamps we were going to donate but we didn't get any consideration for that. "B. C. Adam's expense to New York April 15, 1912, $48.15," I think I went down there on this gas business, but that wasn't
846 all of the expense; I think that was in connection with the settlement we were trying to effect and I went down to see the New York office about it. "April 30th 1912 Lincoln Gas & Electric Light Co. contingent $58.80" I can't tell what that is without getting some more books or vouchers, I can't explain it off hand. "Nebraska Wesleyan University donation $80.00" under date of May 13th that was a donation to this outfit at University Place where they were trying to get an endowment fund. We were not trying to encourage the gas business out there, an item of that sort is absolutely forced on us, there is no way to get out of these things that I know of and exist. March 31st "Savoy Hotel Cafe $20.04" that is our old friend again. J. D. Schuff is our new business manager. May 29th "Expenses Iowa District Gas Association $229.10, we got the Iowa District Gas Association to come to Lincoln and our share of the expense was $200.00 and we charged it under Mr. Shuff's name, I think the Commercial Club also donated $200.00 to that. Under June 12th 1912 "F. O. Pierson donation $20.00," that was some fraternal or religious order. June 29th "Chapin Bros., palms for office $14.25" they were evidently bought for the office, those properly should have been charged to new business rather than that account. They should go in somewhere as a part of the necessary expense of making gas, they look well against the marble just the same as the door mats against the doors. June 29th "Iowa District Gas Association due $18.00" that means that this company is a member of that association and pays those dues. "Joers Motor Company auto hired $13.25" I don't remember what that was. June 29th "Savoy Hotel $27.96," that is the heads of departments taking lunches. June 29th "Jacob North & Co. banquet songs and tickets $9.35" that item covered the banquet tickets and song sheets for the Iowa District Gas Association. June 29th, "Sanitary Fruit
847 Company, cigars $5.00." I don't remember that item. "Lincoln Gas & Electric Light Co. contingent $10.20," I imagine that is one of the items for which we put a slip in the drawer, it has possibilities of covering other things, yes, all of which can be seen on the voucher and all of which Mr. Adams the City Expert has had access to. "L. J. Dunn, treasurer donation $20.00" that was for the Y. M. C. A. "Savoy Hotel Cafe $9.80," that is for

the meeting once a week for the heads of departments. There is all the way from six to eight people usually, sometimes more than that at the once a week luncheon at the Savoy Hotel. "Lincoln Sanitarium, R. A. Phillips $13.56" Mr. Phillips was taken sick on his way back from Denver and we sent him there at our expense. "Nebraska Prison Association donation $8.00" under date of August 26th. We donated to that association every year. September 20th, Treasurer German Day donation $40.00." On items of that character I always tried to get out on a basis of what others in town donated, if Rudge & Guenzel donated $100.00 I usually thought we ought to get out at about $20.00; or I would get a line on what Miller & Paine donated; they always thought we ought to donate more than anyone if our gross earnings were $450,000.00 as against someone else 1,000,000. These donations have never been voluntary, they have always been forced on us. As to whether it amounts to this, that the men connected with the company and getting substantial salaries would escape making a subscription by unloading it on the company while the ordinary man like the lawyer makes his individual subscription, that is ridiculous as I look upon it, the same as Miller & Paine it comes out of the company funds, it don't come out of Mr. Miller's individual pocket, that will hold true for all of these people, while you lawyers who make your living off of them have to make your own donation out of our own pocket.

848 Mr. B. C. ADAMS, recalled for further cross examination.

Cross-examination by Mr. Foster:

Concerning Exhibit "270" and the items contained on the first page for the year 1907 and contained in the totals under account #1505 in operating expense reports, I would judge they were taken from the Accounts Payable Journal or the expense vouchers and that they have appeared in the summaries of our operating reports. Concerning the item in Exhibit "279," under date January 31, 1907, "employers' Liability—insurance $13.32," I see that it states on this exhibit that it is transfer voucher #318, I suppose the amount of $13.32 was in error charged to some other account and then by transfer voucher put in to this account #1505, I am familiar with the way this account is handled and that is why I am answering as I am. It covers our liability insurance premium for employer's liability; we have shown in court here the policy under which we carry that liability. That don't cover all of our employees. We have included some of all departments, except the executive department, I don't think of anyone in our executive department that would be covered by the liability policy. As to using the words," Executive Department as it appears on the books as an arbitrary classification, I will just say officers, I wasn't covered, neither were the secretary nor the attorney. The second item appearing on that exhibit for the month of January 1907, is "H. F. Rose, January salary $41.67," that was for legal purposes the account says salary I don't know whether there was more than one salary paid to Mr. Rose by this

company, there was not to my knowledge. Where the name of H. F. Rose appears throughout the exhibit with the month
849 and amount of salary I expect that was for services as an attorney for the company, I wasn't manager at that time, and had nothing to do with that department. I think wherever the item "Employers' liability insurance" appears in this exhibit is the same as the first item described.

March 30th 1907 appears the entry "L. G. & E. L. Co. rebate C. O. W. $4.44." I think that was for gas we furnished to Mr. Whedon that we charged off our books and received no pay for it. I don't know the reason it was charged off. The item "C. O. W. rebates" appears a number of times and I presume is the same thing in each instance, I would know what it was for if I saw the item or rebate slip, I judge from this exhibit that you have taken that amount from the rebate slips, I think it would cover the gas furnished Mr. Whedon free. I presume that holds true for all of the items that appear as "C. O. W. rebates" in this exhibit. Under date of April 30th 1907 transfer voucher #357 appeal to Federal Court $20.83 I don't know what that Item represents, but think it had something to do with our appeal in this gas case. It is and was at that time one of the expenses in this case met by our company, and wherever the item "Federal Court appeal" with the amount following appears it is for the same sort of a charge and is one of the expenses of this case.

Under date of May 31st 1907 the item "Transfer voucher 371-c supersedeas bond, $125.00" I don't know what that was. It wasn't for the $150,000.00 bond in this case, we couldn't have gotten it in at that time. It might have been for some other case, we had our occupation tax cases and our franchise case, if it was every month that is what it is, it covers our premium on the bond in the dollar gas case, the premium on the bond takes care of the over charges should the court find there had been any overcharge. Wherever that item "Supersedeas bond $125.00 appears in this exhibit *is* represents the same sort of an expenditure.

850 Under date July 31st 1907, the item "L. G. & E. L. Co. City Occupation Tax Case $5.00" I don't know what that repsents, it had something to do with the occupation tax case, it was an expense in the suit as I understand by the city which we are resisting. Under date of September 21st 1907 the item "William Grant legal expenses voucher #3600 $100.00" I don't know what that was for, probably the manager at that time would; William Grant was the city engineer, I believe at that time; I have an idea that was for some work in connection with the discovering the cost of our gas mains in this city, I don't know whether he was city engineer then or not, I know he did some work in that connection. He was not an attorney to my knowledge; I don't know what he purported to be. I wouldn't say that was in connection with this suit, but with work done in discovering the cost of putting in our mains while this suit was pending; we weren't interested in that especially except for this suit.

Under date of October 8, 1907, the item "M. E. Wheeler, report-

ing and transcribing company v. city $117.40," Myron Wheeler was the reporter that took the evidence in the case the first time it was tried. In this case. I presume that was one of the expenses of this lawsuit, he had some expense but I don't like to testify that I know positively that is a fact when I only have this exhibit before me which I didn't make up. That would be my best impression, subject to revision.

Under date of October 31, 1907, the item "H. L. Doherty & Co. C. A. Freaueff's expense, $30.00," I expect that was in connection with a visit Mr. Freaueff made here. I don't believe Mr. Freaueff was ever a witness in this law suit, that is C. A. Freaueff, he is an attorney. I presume he was here on legal business connected with this lawsuit at that time, that would be my best judgment, and that item, in my best judgment, is connected with this suit.

Under date October 31st 1907 the item "Lincoln Hotel M. E. Malone's expenses $10.00," that represents his expenses here
851 in connection with this case, Mr. Malone was one of the witnesses in the first hearing of this case.

April 30th 1908 item, transfer voucher "530, expense Gardiner & Freaueff, voucher 5507-8 $45.10," I don't know what that is. Gardiner is in the New York office. I don't know whether the other is Frank or Charles Freaueff; I would say from the manner in which they charged our expenses and that appearing under account #1505 that it had something to do perhaps with the legal expenses of this suit, I think that is an item connected with this suit; and wherever the item "expenses of Gardiner & Freaueff, voucher 5507-8, $45.10 appears in this account I think it is the same sort of an item as the other, and connected with his visit as a witness in this case.

June 8th 1908 the item "G. H. Thummel, court cost $10.00" and below it the item $1.00, I don't know what that is, my guess would be perhaps as a witness in the case or something of that sort. I expect those items are court costs in this case.

June 26th 1908, the item "M. E. Wheeler, reporting testimony company v. city before U. S. examiner $152.40," was one of the expenses in connection with this suit.

July 31st 1908, the item "E. C. Strode, July salary, $66.66" that represents the proportion of his salary as attorney for the company that was charged to this account; I don't remember what division was made of the salary of the attorney between gas and electric department, I expect 80% to gas and 20% to electricity, I don't remember. It is in the record here somewhere; and wherever that item appears it is for the same sort of service where the items are the same. Mr. Strode takes the place of Mr. Rose in this account as attorney for the company. Where prior to the month of June 1908 the amount of the salary for the attorney was $44.66 as charged to this account, and subsequent to June 1908 was $66.66, I account for the increase in the amount on the ground that Mr. Strode is a better trader than Mr. Rose. I don't know what Mr. Strode's
852 reasons would be for naming one salary or another. Mr. Rose's salary as attorney for the company prior to the commencement of this lawsuit was probably $1,000.00 per year, I don't

know; I don't know what Mr. Strode's salary is now, while I was here as manager I think it was $3,000.00 per year.

November 7th 1908, the item "H. Honeywell copying briefs company v. city $29.20" is an expense in connection with this suit.

November 30th 1908, transfer voucher #628, distribution, rent and heat $10.00" my recollection is that covered the heating of the room where they held court and the rent, and was one of the expenses in connection with this lawsuit.

December 16 1908, the item "Benton Bros. printing brief, company v. city $38.25, I think that was for this suit; it might have been one of the others, but I think it was this one.

December 31, 1908, item "transfer voucher #642, rent and heat," I think that was for the same purpose as the other rent and heat charge. All these item- enumerated as having been charged during the year 1908 appearing in Exhibit "270" are contained in the totals of account #1505 and shown as a part of our operating expenses in Exhibit "26" if the items have been properly taken from our accounts payable journal and expense vouchers, they are shown in the operating report for that same year, as a part of our expenses reported. The same thing holds true where the same items appear throughout the year 1909, as shown on this Exhibit "270," and are included in the operating expenses shown in Exhibit "27" for the year 1909.

June 30th 1909 the item "Transfer voucher #731-*d* $42.33," and the notation "voucher missing" I do not know what that is for.

July 31st 1909, Item "Transfer voucher #751, vouchers missing from file, $44.60" I do not know what that represents.

853 That item appears through a number of months here but I have no idea whether it is for the same thing, there would be a voucher for each month, but the same amount following each month possibly it might have been some expense incurred in advance and charged off by months; it is likely where the same amount recurs over a period of a number of months that it represents a larger item subdivided and spread over those months, a suspended account to equalize it so that it would appear normal instead of abnormal. I don't know what the item is without looking up the voucher there would have to be an explanation of it somewhere.

I was manager of this company most of the year 1909; I think I was acting manager for the period from February,—possibly March, or April,—I don't remember which these items aggregate the sum of $845.13 I haven't any recollection of that sum of money being spent for any particular purpose and handled in this manner, being in the legal expense account I would think they were probably something in connection with this suit or some one of our suits. I don't know that this money was spent in connection with this suit. The size of an item would indicate that it had something to do with this suit.

July 31st 1909 the item, "transfer voucher #751 appeal bond $75.00" that item occurring eleven times thereafter and amounting to $825.00 I presume it had to do with the premium on our supersedeas bond in this case and wherever that item appears throughout

this account the same answer holds good, and represents the same expense.

November 18, 1909, the item "E. G. Maggi legal services rendered, voucher #7268 $12.00," represents the payment to Mr. Maggis for some services he rendered, I haven't any recollection what that service was but doubt if it was in connection with this case.

854 March 17, 1910, the item "E. C. Strode balance February salary, $133.33" represents legal services rendered by Mr. Strode. Prior to the month of February he received for his services to this company in this account $66.66 which raises the monthly charge on this account just double that of $66.66. I don't know that this is a balance in addition to the $66.66. I expect that is where the raise in salary was dated back and a voucher issued for it. I suppose Mr. Strode demanded more money and that was the reason for raising his salary. I don't know what if anything, it had to do with this suit. I don't think I was present when this arrangement was entered into. I don't think I knew anything about what the reason for the raise was. Since February 1910 Mr. Strode's salary appears to have been $200.00 per month as charged into this account; I expect $50.00 was charged to the electric department for the same period; so that from that time to date the gas department has been paying 80% of the legal expenses and the electric department 20%. The division was made that way because it appeared to us that it was the correct percentage of the expenses in the two departments. I don't believe the fact that this litigation was in the gas department and not in the electric was ever considered in making the distribution of the expenses, I don't think it was considered in raising Mr. Strode's salary, I hadn't anything to do with that if I remember. April 30th 1910 the item "C. A. Freaueff April salary $40.00" was paid him for legal services; in conjunction with Mr. Strode he has examined, I just, — pretty nearly all the contracts, the large contracts that had to do with the operation of the company, he has drawn a good many of the papers too; that is a regular salary drawn by Mr. Freaueff and wherever that item appears in this account it represents the same thing.

855 June 27th 1910 the item "E. C. Strode, telegrams to Armstrong, Doherty and Freaueff $5.70" that item appearing in this account would indicate that it had something to do with our legal affairs. As to what legal affairs that we would have that would require telegrams to those people other than this lawsuit would say the occupation tax case and the franchise case, Oh, we have had other matters of various characters and with the purchase of other companies, such as the Havelock,—getting a franchise in Havelock and University Place for gas. The reason for charging such an expense into this account is that in one of our legal expenses, I don't say that we did I say we have had expenses of that character; as to why we charged this item into this account I don't know. Whether, when there is anything in connection with the occupation taxes and the franchises and is taken up with the New York office is in connection with the settlement of this suit I would say not necessarily, or whether it generally was, I wouldn't say that either.

July 30th 1910 the item "transfer voucher #950 Myron B. Jenkins, expense $10.00" I think that was in connection with some investigation we made in College View in reference to running our service our there; that is my recollection as I remember Jenkins is a man who lives out there; I know I had someone out there to do some work there. Wherever the name M. E. Jenkins appears in this account with expenses incurred it is for the same sort of an item.

June 30th 1910 item "transfer voucher #935, appeal and bond, $219.33," I expect that has to do with the premium we have to pay on the bond in this dollar gas case, and wherever that item appears in this account it is for a similar expenditure.

October 31, 1910, the item "transfer voucher #999, Strode, Denver trip, $26.66" I don't know what that represents, but I think
856 Mr. Strode met Mr. Freaueff in Denver; I don't know what business they were discussing, I imagine it was this case, I wouldn't say; that item occurrs a number of times in this account and was probably distributed. In all the items contained in this exhibit for the year 1910 they are contained in the report of operating expenses under account #1505, as contained in Exhibit "28" already in evidence.

March 31st 1911 the charge "H. L. Doherty & Co., legislation $40.00," I don't know what that item represents, I presume the money was paid to Doherty & Co. It was during the time I was manager.

June 30th 1911 the item "transfer voucher #1190, clerks' cost and printing records dollar gas case, $138.33," that was an expense connected with this suit, and wherever that item appears throughout this account it has reference to this case, and represents the same item.

October 31st 1911 the item "transfer voucher #1323, Freaueff & Robinson, apportionment of expense on $500,000.00 notes ($573.95) $76.53," I don't know what that expense was unless it was some expense attached to the issuance of the $500,000.00 three year notes, incurred by Freaueff & Robinson, attorneys, they are the New York attorneys for this company, those are the notes heretofore referred to in this case, and as to what that expense has got to do with the operation of the gas property in this company in Lincoln, would say, it has got to do with the keeping the thing going; in the way of financing it. I take it this is an expense incurred by Doherty & Co. in floating the $500,000.00 issue of notes; the total of those expenses is $573.95 apportioned here in amounts of $76.53 each over several months.

October 31st 1911 the item, "L. G. & E. L. Co., certified copies appeal dollar gas case to District Court $3.70" that represents an expense connected with this case and wherever that item appears in this account it represents a similar expenditure.

857 December 30, 1911, the item, "L. F. M. Easterday, figuring dollar gas case, $8.00" that is another expense in this case and wherever it appears throughout the account it represents the same expenditure.

December 30th, 1911, the item, "Freaueff & Robinson, Freaueff's

Washington expense account $66.36" that represents the expenses of his trip to Washington in the argument of the dollar gas case; I don't think he participated in the argument in that case but went there to advise with Mr. Rose.

December 30th 1911 the item, "transfer voucher #1380 balance due Freaueff & Robinson on note, expense account, $229.58; and on supersedeas bond $750.00 making a total of $979.58" that is an expense chargeable to this case. All of the items appearing in this exhibit for the year 1911 are reported in Exhibit "29" under account #1505 and are chargeable to this case as a part of our operating expenses.

March 31, 1912, the item "transfer voucher #1432, Stout & Rose account dollar gas case ($3,122.37) and the amount charged under this date $260.20" is an expense chargeable to this case; $3,122.37 was the total amount which was charged off at $260.20 per month until it was all taken care of and that is the item for their services in the dollar gas case in the United States Supreme Court and also to cover their services in the Federal Court and is in addition to any sums paid to Freaueff & Robinson and to E. C. Strode; I think it was their services up to that date and expenses probably.

April 30th 1912 the item, "H. L. Doherty & Co., voucher #12104, missing, $27.96" I don't know what that represents only that it must have been some legal expense, I don't know whether it has any connection with this case. No one in the gas company's office can tell what this item is unless they have something to guide them, I don't think anybodie's recollection would cover an item of that
858 sort even for an item of that size paid out within two years, when you consider the thousands of accounts a man can't remember an item of $27.00; but if it appears a number of times then there must be an explanation on the voucher or on some of our records to show what it is for.

May 31st 1912 the item, "E. C. Strode copy of the application of bond dollar gas case $1.00, E. C. Strode expenses to Omaha dollar gas case $8.10 total $9.10" that $9.10 is chargeable to this case.

June 29th 1912 the item, "transfer voucher #1486, paid to F. D. Blendermen for securing rate in dollar gas bond $100.00" my understanding was that Mr. Blendermen was able to prevail upon the bonding company to reduce our rate on the bond and for that service we paid him $100.00; that was an expense in connection with this case. I think we also paid Freaueff & Robinson for some work they did in securing a rate reduction.

Under the same date and same transfer voucher number appears the item "apportionment premium National Security Company, bond dollar gas $136.36" that was an expense in connection with this suit, and wherever that item appears in this exhibit it represents a similiar expenditure.

Under the same date appears the item, "transfer voucher #1498, telegrams dollar gas case $4.44" that is another item of expense in connection with this case. In regard to the $136.36 that is a subdivision of a larger item.

June 29th 1912 item "transfer voucher #1499 services of Freau-

eff & Robinson dollar gas case $208.33," that represents their services in the dollar gas case; I don't know what the total amount was of which this is an apportionment. Whether that is for the service of Freaueff & Robinson in this case in the Supreme Court of the United States, I don't know; I would have to see the original invoice; they charge us quite a little for the supersedeas bond in connection with this case but I would say that the larger part of their expenses
859 they have charged us in connection with the dollar gas case. I think where the name of Freaueff & Robinson appears in this account with the amount of $208.33 that is a part of some larger item subdivided, and is for services in this case. That is C. A. Freaueff, he is an attorney and a brother to the Freaueff an officer in this company.

All of the items shown in this exhibit for the year 1912 are contained in the charge to operating expenses under account number 1505 as appears in exhibit "30,"—I would only make this exception that would be, in the case of our having some date after the report had gone in and been closed for the year of having accounted incorrectly for some of the items and later charged them into some other account, but I don't imagine that is the case.

These accounts taken off the book, accounts payable journal, are all legit-mate charges to operating expenses, but they might go from that book into operating expenses and then we have an audit and discover that we have mis-charged some items and by transfer voucher take it out and put it in the proper place, but that probably isn't the case with any of these particular items.

Exhibit "271" intitled Rebates & Allowances, the item January 31, 1907 "voucher # 2613 S. H. Burnham, gas and electricity $47.15," that covers gas and electricity furnished Mr. Burnham, he was a director of the company and I think owned a little stock, I don't remember how much, don't know as I would know; at the time of the reorganization, when we took it over the McMillians he had quite a lot of our stock, I don't know when he disposed of it but think when the price went up. That had no effect on the amount of rebates received by Mr. Burnham. Where the name of Mr. Burnham appears in this exhibit as having received rebates it is for gas and electricity, I think it couldn't be for anything else;
860 the only other thing it could be for would be services in the way of consultation with Mr. Burnham or something of that sort. We never got any financial assistance as far as that goes, Mr. Burnham was a director in the Lincoln Traction Company after this thing was started.

January 31, 1907 the item "C. O. Whedon, gas and electricity $13.67" I don't know why that amount was rebated to Mr. Whedon. I don't know how far back that extends. It continued after this date of January 31, 1907 until the time of Mr. Whedon's death. I don't know what the consideration for it was, don't know whether he was a stockholder or not, he was the attorney of the company at one time prior to Mr. Rose's occupancy of the office. As to who authorized me to allow that name to remain on the free list, I don't know that I was ever authorized in just that way. The Board of

Directors never said anything to me about it, neither did the president. I think I talked with the auditor about these rebates and allowances on various occasions, he didn't think very well of it, but didn't discuss the reason why they were allowed to remain. I never had any direction as to the distribution of these items to the various accounts. As to where the company's employees get their authority for distributing these accounts, the old distribution was an arbitrary one, where the authority came from I can't say, I had nothing to do with it at that time; I think when it was changed over I asked that a division be made of 80% and 20% as well as on those other accounts, I asked our secretary to make that division. I don't know as I had any good reason, if I were to do it now I would divide it according to the consumption of gas and electricity. I found that free list in existence when I came and permitted it to remain. Mr. Burnham is a stockholder of this company of necessity at the present time; I don't know the amount of his holdings, I can't find out, our stock register don't always show all the stock held by an individual, he might hold stock in someone else's name with an endorsement on the back. He is a stockholder of record, but how many
861 shares he holds I don't know, I think our records show probably one or two hares. I think I do know a reason for allowing the rebate to Mr. Honeywell at this time, for 1913 and 1914,—no I can't say either, I don't know why he was put on the free list, but probably because he was an officer of the company, I do know about Mr. J. K. Honeywell, he was at one time manager, machinist, meter reader, collector, gas maker and almost everything for the company and I think the company felt that Mr. J. K. Honeywell should have some consideration, Mr. J. K. Honeywell came in at one time and asked me if he should not pay his bills and I told him to let it drag for a while, I did have something to do with that particular person.

I don't think Mr. E. Bignell has any connection with this company, I think I sold every share of stock Mr. Bignell had some year or two ago, in 1910, his name still appears on the rebate list the reason for that I couldn't tell you; I don't know why it was put on, I think Mr. Bignell was a stockholder since the reorganization up until I sold his stock. I am sure he never received any dividends on his stock, we never paid any dividends on any of our stock. I did try to get Mr. Bignell at one time to receive some compensation for services he rendered, I wanted to keep the electric lighting service at the Burlington and particularly the passenger station but I couldn't keep it, the Traction Company got it. We still retained him on the free list.

I don't know anything about the reason for T. H. Pratt receiving rebates and allowances at all. He stopped April 8, 1907, your tabulation shows he began January 8, 1907. I don't know that it extended back a great many years beyond that. I don't know anything about the rebates and allowances he received but the tabulation you hand me here shows that he received rebates back to March 1, 1902. I don't know the reason he was on the free list. I don't

know who would know about that. Mr. Pratt was never
862 connected with this company in any way to my knowledge, he has never been connected with the company since I have been connected with it; to my knowledge he was never a stockholder or an employee of the company. The fact is he was city clerk, and also a member of the City Council at one time, but not a member of the Council during this period of gratuity, he wasn't receiving anything from us as a gratuity at the time he was a member of the Council.

I don't know whether Mr. J. K. Honeywell is a stockholder of this company or whether Mr. Whedon was, yes they were both stockholders at one time.

January 31, 1908, on this exhibit "271" the item, "voucher # 4165 'W. L. D.' $5.89," I don't know anything about that.

January 23, 1909, item "voucher # 5730 'A. B. J.' gas and electricity $65.85" I can't think now what that would be. Mr. Honeywell might know about that. The reason these items should be charged as operating expenses in this rate hearing, they are certainly an expense, as to why they are a necessary cost in the manufacture and distribution in Lincoln would say, that it is a practice hard to discontinue, an ancient custom against which the mind of man runneth not to the contrary, in the case of J. K. Honeywell I think that was justified in every respect; I don't know why the others were incurred in the first place, they may have been compensation, they may have been justifyable operating expenses. Other than the allowances to J. K. Honeywell, I don't know who can tell about them, it is a history that I don't know anything about, possibly the gentlemen themselves would know. These rebates are put in as allowances and rebates and are taken out of our gross earnings, in so far as the division was incorrect, half and half, we have taken the electric bills out of the gas receipts, if they didn't use half gas and half electricity the gross amount of expenses would not be a proper
division as it has been divided, in other words, as to charging
863 the electricity also to the gas department, providing that more than half had been electricity used, if less than half had been electric-*yt* used they haven't charged enough to the gas, you understand these items as allowances and rebates are deducted from the gross revenue, they affect the gross earnings of the company; if the consumers were paying these amounts the cash receipts would be just that much more, it amounts to about $1,000.00 a year. There is one element that occurrs to me; we perhaps haven't charged them for electricity at the same rate as other people, if we put them on a high rate to commence with we never changed that rate, but it made no difference as to whether we did or did not as to that, I don't know whether we made a change in their rate from what we were charging other people or not. It might affect the net results in reducing the gross operating income from gas, if we were making a division based upon the usage of gas it wouldn't, but if we had reduced our electric rate then we haven't charge- as much electricity against the gas as we would at a higher rate, and if we charged a higher rate for electricity we have taken that much more out of the gas revenue.

Cross-examination continued by Mr. Morning:

The division made in our system of accounting of these rebates between the gas and electric departments corresponded to the division made to other general expenses; when we were dividing the general expenses equally, these were divided equally, and when we changed our apportionment we changed correspondingly each division. With those gentlemen who received free gas if they were also electric customers they were also getting free electricity, and they were all customers of both departments, unless it was T. H. Pratt during a portion of the time.

864 Concerning rebates to C. O. Whedon we have also entered into the legal expenses at least during a portion of the time, items as if they were paid to C. O. Whedon which I testified were for free gas, that was my understanding from the exhibit I had here. As to how that was done, that was before my time, my judgment would be that the manager at that time thought that a part of Mr. Whedon's gas ought to be charged as legal expenses and the balance as an allowance and rebate, so that the total amount rebated to Mr. Whedon would be the amount charged to allowances and rebates and legal expenses; I think the sum of the two items would equal the sum total of his two bills, it ought to do that, and when I get my itemized statement I can tell what the facts are. My opinion as to the method of handling these rebate accounts is so far as they represent gas an- electricity to these gentlemen, is *th* at we took the meter readings and charged them the resulting sum on the consumers' ledger; we showed these amounts as accounts receivable from the sale of gas and electricity and then when we showed our allowances and rebates these amounts were also carried with the allowances and rebates as if the money had been paid out by us. To illustrate, taking Mr. Burnham's gas bill during that period, we show on our financial reports a line for gross receipts, what I would call the top line, that includes all we charge up on our consumers' ledger against the customers for gas and electricity used, and as shown by meter readings, that would include these items; and in another line underneath that we show the allowances and rebates, and in that line would be some items we have allowed in our gross income, then by deducting the allowances and rebates we get our net gross income; then from that income we deduct our bad debts, and when that deduction is made we have what we hope our net gross receipts are going to be. In the first line of gross receipts we

865 don't assume that we are going to get the cash, we assume that is what we ought to get from the gas and electricity sold, and then we deduct from that what we know we have rebated. In our gas operating report in line #905 we show a certain amount of gross receipts for each year, and line #905 includes the amounts we charge up against those gentlemen, in the operating report it is true there is reflected in the gross receipts a sum sufficient to include this money that represents their gas bills just as if they had paid the cash; in line #905 the gas bills of those gentlemen are shown in our operating report as if we had collected the cash but in line

#906 we add the meter charge on minimum bills; then in line #907 we show the forfeited discount; then in Line #908 we show the total earnings from gas, that includes the total free gas as well as meter charge on minimum bills and the forfeited discount; from that we deduct the bad debts; then in line #910 we have the gross earnings in the gas department. Line #910 will then show the total sales and forfeited discounts as covered by the items I enumerated in the various lines and the allowances and rebates are deducted later so we have included in that line the sales we would expect from these gentlemen. In other words Mr. Burnham's gas bill during all of that period our gross receipts for each year is included in line #910 of the operating report and we have charged into the expense of operation his, and all of these other gentlemen's, gas bills as if we had paid out the money as an expense. In line #910 there would be a duplication, as against the consumers in this hearing, if we failed to enter in our gross receipts these bills as having been collected and then if the deduction as to operating expenses was made it would double it up,—no I will take back all I said. The gross receipts as shown in line #905 represents the gross receipts after the allowances and rebates have been taken out and not as I before stated; the total gross receipts we might expect from our gross sales is shown in line #1605 on page 16 of the op-
866 erating report, then from that amount is taken the allowances and rebates which includes such items as the gas and electric bills of Mr. Burnham and those other gentlemen, then we get the net amount shown as the sales; then that amount is taken as shown in line #905 and represents the net income we may expect from our sales exclusive of bad debts. We include the free gas bills in the gross receipts as having been collected before we deduct the free gas bills, and don't subsequently deduct them again as operating expenses; we deduct them in arriving at our gross receipts, so there is no duplication. We make these reports monthly.

Our cash account is expected to balance with our ledger account of cash received. Supposing Mr. Burnham's free gas bill was $10.00 the books would not be out of balance in case we didn't get that $10.00 because we have already taken care of that account, the cashier counts the rebate slips as money. These rebates and allowances are charged in the accounts, for instance in this item of C. O. Whedon rebate in line #1505 that is the same item I was asked how it could get into the legal expenses and also into the allowances and rebates; we deduct the rebates and allowances from the gross receipts in line #1606 and on line #1607 we have the gross receipts, and that is what we carry to line #905, and all we deduct from that is the bad debts, what is left is the gross operating income. From that we take the operating expense account. In the case of Mr. C. O. Whedon I think the amount shown here as legal expenses for Whedon in the amount of $4.44 in January 1907 was deducted from Mr. Whedon's total bill for that month and charged to expense and the balance charged to rebates and allowances. I am assuming that these things have all been charged against allowances and rebates, if they haven't they have gone into this incidental account,

referring to account #1503 called incidental account, and
867 these rebates shown in Exhibit "271" should have been charged, and I am assuming they were charged to allowances and rebates, if they appear regularly in the incidental expense account they should not be in the other account, but we have other items besides these. I will look that point up and will answer that question later.

Whether we have any other method, besides the one shown in our account of rebates and allowances for rebating gas and electric bills, in answering that I can straighten out the tangle, I was in this morning, the bills that accrued against Mr. Bignell, Mr. J. K. Honeywell, Mr. Homer Honeywell, Mr. Burnham and Mr. Whedon were carried in our gross revenue and went all the way through and are to be found in line #910 and the charge offs for those items were carried in the operating expenses account and appear in the expenses in the line underneath line #910, they did't appear in the rebates and allowance account #916 of the operating report. The amount deducted from gross revenue earned on line #1606 represents the allowances and rebates for gas, that might be an adjustment of an account, from over-reading of meters or something like that, it is carried in our accounts payable ledger there on a sheet as allowances and rebates but isn't carried as an expense. It is found under the heading of allowances and rebates. I have now outlined two methods by which gas bills have been rebated to consumers or persons, one against expenses and one taken care of through allowances and rebates. There is no other method besides that that I know of,—the only other way would be to connect the service in without a meter and make no account of it at all, I do not know of that being done. I think we have charged off as bad debts the bills of persons by way of rebates. I can't say whether we have done that where money was coming to the person, from the company, whose account
was charged off. In our accounts there appears an account as
868 "W. M. M." it sounds like W. M. Morning; I don't know whether it is W. M. Maupin or not, I will ascertain whether that is correct or not. I testified that the name W. M. N. appears in our account as one who received a rebate and allowance, I don't think that would be W. M. Morning.

Referring to Exhibit "323" being the incidental expense account known as account #1503 the item under date of January 5, 1912, "Charity Organization donation $20.00" that represents a portion of the donation made to the Charity Organization.

The next two items under January 8th 1912, "W. F. Jones expense account C. Jones' death $60.00 and H. H. Hehley expense account C. Jones' death $7.00," and the next item under date of January 9, 1912, "Castle, Roper & Matthews, undertakers, C. Jones' death $227.00" was on account of the death of C. Jones. That was included in this incidental expense account because we didn't know just where to charge that, that account is a sort of a catch all. C. Jones was an employee of the company and in their direct pay.

The item "G. R. Wolfe & Company cigars $9.60" represents cigars, I don't know who they were given to or who smoked them, they are

here given in the gas expense account because it was an expense incurred by the company; the general purpose they serve in the making of gas is, they would help a lot of people make gas.

January 20th, "George Bros. proxies, $11.31" I suppose that is for printing the proxies of the annual election notices to be mailed out.

January 31, "B. C. Adams, January expenses $40.00" that was a portion of the expenses; I received every month, $50.00, for which the company received an intangible source of benefit largely. It is justified on the ground that it was an expense that had to be taken care of.

869 January 31, "transfer voucher #1386 Windsor Trust Company for handling notes (650.00) $16.25," that probably had something to do with the $500,000.00 three year notes. I don't know what the charge made by the Windsor Trust Company for that item was, I don't remember, that information is all in the record, and was all introduced at the time we went over the note history. I don't know from this exhibit what the item is and I can't tell you; the secretary of the company would know, and I expect our record will show, the transfer voucher itself ought to show, if the vouchers don't show any more than that I don't know what it is.

January 20th "Savoy Hotel Cafe services $11.28" that covers the expenses probably the employees, at the Savoy Cafe. I imagine these amounts shown in this account #1503 in relation to the whole amount spent for the item shown there is 80%. I think this would be 80% of the amount paid for this item.

The item "O. B. Clark secretary, dues, $8.00," that is dues in the Business Men's Association. I know what that Association is in this way, the Business Men's Association has a definite purpose, we donated to it for a definite purpose, but I don't know if I just — what to say what their business is for a matter of publication.

The item "Iowa District Gas Association dues, $3.00," is for dues in that association. Our company pays dues for one or more individuals to five or six organizations of this character.

The item "Lincoln Commercial Club dues, $12.92," is the quarterly dues of the company, I think, either the membership of the company or those employed by the company, I think the company as a company holds a membership in the Club. When I was here I had a membership and Mr. Schuff, and at different times we had more than that number for which the company paid the dues.

The item "Lincoln Candy Kitchen candy $2.40" I think that was probably used around the office.

870 The item "Savoy Hotel Cafe, $11.32," is the same expense indicated once before for the heads of departments.

Wherever the item, "B. C. Adams expenses, $40.00," in each one of the monthly accounts, that is the same item testified to before. I am not prepared to state what the item "Windsor Trust Company, note expense, $16.25," represents. I doubt if anyone in the office can tell what that item is for, unless perhaps Ross Phillips could tell.

February 29th the item "transfer voucher #1411 Adams and Strode New York trip ($250.00)" closed with this entry $50.00,

that is for a trip to New York by Mr. Strode and myself, I can't just exactly recall what that trip was for.

In the same month the entry "B. C. Adams expenses managers meeting New York $280.00", I take it that trip was for the purpose of attending a managers meeting of the Doherty properties. I did not make two trips to New York in February, that first entry don't necessarily mean that Mr. Strode & myself were there in February; probably that occurred sometime prior to that and had not been charged off.

The item "Lincoln Gas & Electric Light Company rebates $34.64", represents those men whose names appear in the rebate and allowance exhibit I think.

The item "Lincoln Commercial Club dues $40.00", that represents dues paid to the Commercial Club for membership, I don't know whether the dues are $14.00 a year, I don't know what they are; I expect that $40.00 item is a portion of the subscription of $200.00 we made to the Commercial Club, and wherever that $40.00 item appears in this exhibit it represents the same expenditure. The $200.00 contribution to the Commercial Club represents a subscription they solicited on the ground that the business men were giving certain amounts to the Club and they thought we ought to pay our proportion, it was an expense incurred by the company by reason of its existence here and that is our reason for
871 charging it into operating expenses. That contribution wasn't made for any given period, we were laid down on by the business men to continue our subscription as other business men were continuing theirs and we did it.

The items, "Savoy Hotel Cafe," appearing throughout this exhibit represents the same thing every time; and the same is true for the expense of handling the notes.

March 30th 1912 the item "Nick Arrigo cigars $2.00" I think they were for a director's meeting, I don't know.

"H. L. Doherty & Co., expense Winans $18.23", I expect that is a part of his expenses for auditing. Winans was one of our auditors.

Item "Fremont Tribune, subscription $2.40" that is our subscription to that paper, this company, it might be should not pay for that; may be we were trying to sell tar over in that market for one thing.

March 30th "Lincoln Commercial Club dues $50.68", that is for dues in the Club, I can't tell without seeing the voucher whether that is something else besides our subscription.

Item "Nebraska State Journal subscription $6.00", that is a subscription to the State Journal which all the business men are subscribing for, that is justified as a charge in the operating expenses of making gas by virtue of the fact that the company is doing business here, and we are expected to do things as other people do them; the paper is a necessity, they always have some items of interest in the morning edition we want to see.

April 13, "Frank D. Eager, donation $40.00", that is a donation

to the fund raised for putting in the street lights that the city was to operate, I am sure about that, the total subscribion was $50.00.

In April the item "Financial World subscription $3.20", that was a subscription to a financial paper that had to do with corporations such as ours, it has to do with the manufacture of gas
872 in the same sense as our subscription to the State Journal, we have to do with the things other business men do.

April 30th the item "transfer voucher #1454 expenses G. A. Montgomery to Lincoln $41.20", that represents the cost of delivering Mr. Montgomery from Montgomery, Alabama to Lincoln, Nebraska.

May 13th, the item "Nebraska Wesleyan University donation" represents a part of the subscription to a fund that University was raising and to which a large number of business men in Lincoln subscribed.

The item "Wisconsin Gas Association dues $3.00" that is my dues for the association, which I continued for the reason that they got up one of the best pamphlets on the experiences of their meetings, of any of the gas organizations. That is all gas.

The item "J. E. Schuff expenses Iowa District Gas Association $239.10", that represents the amount of money expended by Mr. Schuff during the visitation of the Iowa District Gas Association here, for the entertainment of the people who came, we were urged very strongly by the Commercial Club to get them to come here, in fact they donated to the expense, that isn't all of it only a portion. I wouldn't say that is all of the expense Mr. Schuff incurred.

Wherever the item appears as expenses of Montgomery to Lincoln in this exhibit it is the same thing I explained a moment ago.

May 31st 1912, item "American C. & C. Co. hats for Iowa District Gas Association $20.75", we bought all the hats worn by the members during the banquet one evening. They did not all lose their hats.

June 12, 1912 item "F. O. Pierson donation $20.00" I don't recollect F. O. Pierson, that was probably some association and the voucher was drawn to F. O. Pierson. It had nothing
873 more in connection with the manufacture of gas than the subscriptions to the various journals.

June 17, "J. G. Bovey, auto hire $4.80, somebody hired an automobile, I can't stay what it was used for or who used it.

June 29th "Chapin Bros. palms for office decorations, $14.25", that was for palms for the office which are located all thro-gh the office from the front all the way back, they are a part of the office equipment.

June 29th "Iowa District Gas Association dues $18.00" that is for dues of the members of the Association, this company evidently had six of its officers and employees in that Association evidently at that time.

In June the item "Joers Motor Company, auto hire $13.20" I don't know what that was for, at that time the company did not maintain any automobiles, they do now for the manager and business manager.

In June the item "National Commercial Gas Association dues $25.00" I think that is the company's membership, we haven't any individual memberships in the National Association.

In June the item "transfer voucher #1500 entertaining Iowa District Gas Association ($150.00) $25.00" that is some more expense attached to the Iowa Gas Association Convention, that expense in this instance was borne directly by the company. That item for $25.00 will appear six times in this exhibit.

June 27th item "Y. M. C. A. donation $20.00", we donated $100.00 when they put up a new building and then donated $25.00 a year in addition to the other donations of that character.

June 29th item "George Bros. badges $2.00", that was probably for badges for our men, I can't say.

June 29th "Jacob North & Co., banquet, soup and tickets $9.35" I don't believe we got the soup; I expect if that were properly set down it would mean that we bought the tickets for the banquet for this Iowa District Gas Association.

874 June 29th "Sanitary Fruit Company cigars $5.00" I don't know where they went.

July 17 "L. J. Dunn, treasurer, donation $20.00", that is a part of the Y. M. C. A. donation and wherever that item appears in this exhibit it is for the same thing.

July 31, "transfer voucher #1524 expense manager meeting at Denver, Adams, Schuff, Mallatt, Montgomery and Phillips, $55.88", that represents a part of the expense at least incident to the gentlemen mentioned having attended the manager's meeting held in Denver last year; the meeting is one that we wanted our men to get all the experience and benefit they could out of. Wherever that item appears in this account it is for the same expense and is a subdivision of the same expense, it is a suspended item.

The next item "Lincoln Rotary Club dues, $9.60 in July 1912", was for dues in that Club, I was a member for the Gas Company for a while and I think Crawford Kennedy was; that item appears from time to time in this account.

August 1912, item "transfer voucher #1553 Denver trip $55.88", that is a subdivision of the same item of expense as the other.
